The Book of Jonah.—According to the statement made in 2 Kings xiv. 25, Jonah prophesied before the victories by which Jeroboam II. restored the glories of

Israel. He belongs, therefore, with Joel and Obadiah; though, unlike them and Amos, he was a northern Israelite. It is possible that he was the earliest of the four, and therefore the earliest of the prophets who have given their names to the prophetic books.

The Book of Jonah is thoroughly recognized both in the New Testament and in tradition, as well known and as scriptural, and hence as having whatever authority of inspiration belongs to any book of Scripture. This fact, and, along with it, the religious teachings of the book, should be carefully guarded, no matter what questions may arise in regard to its authorship, or the settling of the difficulties it presents.

We now resume our study of the history. Unless reasons can be given for some different interpretation, the Biblical numerals make the interval between the death of Jeroboam II. and the destruction of Samaria to be seventy-four years. The chronology adopted in the BRITANNICA's article on HOSEA would reduce this nearly one-half, while still other different views of the matter have their advocates. These differences cannot here be discussed; it is sufficient to say here that the numerals given in the BRITANNICA are merely tentative; the failure of any one of half a dozen conjectures would leave them groundless; there is reason here for careful inquiry into all items of evidence that may throw light upon the Biblical numerals and statements, but no reason, as the evidence stands, for rejecting or suspecting these.

In any case the death of Jeroboam was followed by anarchy in northern Israel. Probably there was an interregnum before the accession of his son Zechariah, and certainly Zechariah, after reigning only six months, was slain by Shallum, who, in turn, was in a month dethroned and slain by Menahem. The ten years of Menahem extended from the thirty-ninth of Uzziah to the forty-ninth. In the early part of it, apparently, Pul, king of Assyria, invaded the land, and Menahem paid him a thousand talents "to confirm the kingdom in his hand." To this date, most likely, belongs the deportation of the tribes east of the Jordan, mentioned in 1 Chron. v. 6, 26. That Pul was Tiglath-pileser seems to be generally accepted, but a comparison of the Biblical dates with the Assyrian shows it to be probable that these transactions occurred before he became king of Assyria. An Assyrian account of them probably exists, in the shape of the fragmentary inscriptions mentioned above, conjecturally attributed to Tiglath-pileser. These mention Menahem as paying tribute, and Uzziah as the chief of an anti-Assyrian confederacy.

Menahem was succeeded by Pekahiah, and he by Pekah, whose first year was the last year of Uzziah. Uzziah was succeeded by Jotham, and he by Ahaz, who came to the throne in the seventeenth year of Pekah. By this time the combination of peoples which had constituted the empire of Jeroboam II. and Uzziah was broken up, and the unity of Israel and Judah was also broken. Pekah joined Rezin of Damascus in war against Ahaz; Ahaz became tributary to Tiglath-pileser, and asked help from him; he conquered Damascus, and deported its citizens, and captured several cities of the north of Israel, deporting their inhabitants, 2 Kings xv. 29. Apparently this is a different deportation from that of the trans-Jordanic people, 1 Chron. v. 26. These transactions are narrated somewhat in full in the Assyrian records, Tiglath-pileser, Ahaz, Rezin, and Pekah being mentioned by name.

The Book of Hosea.—According to its inscription Hosea prophesied in the times of Jeroboam II. and of Uzziah, Jotham, Ahaz, and Hezekiah, of Judah. Of the prophecies contained in this book the earlier antedate the death of Jeroboam, but, perhaps, none are later than Uzziah. The historical situation exhibited in the earlier prophecies of Hosea is the same with the contemporary situation as shown in Amos; the

later parts of the book often directly mention Assyria, and represent Israelitish public men as in a state of perpetual intrigue with Assyria and with Egypt, e. g., v. 13; vii. 11, 16; viii. 9; ix. 3, 6; x. 6; xi. 5; xii. 1; xiv. 3. The violent changes in the monarchy are also alluded to in such passages as viii. 4 and xiii. 11. The absence of elements like these from Amos, Obadiah, and Joel, and their presence in Hosea, are facts that enable us to fit the dates of these prophecies very closely to those of the history.

The Earlier Prophecies of Isaiah.—The points in the treatment of Isaiah which especially need notice have already been considered in the article on ISAAH. The parts of Isaiah which we naturally assign to the reign of Uzziah are the three prophecies contained in chaps. ii.-vi. The historical situation here ought to agree with that in Hosea, and the agreement actually exists, if we make due allowance for the fact that Isaiah is essentially a Judaite prophet, and Hosea a Northern prophet. The Book of Isaiah, chaps. vii.-xii., is made up of prophecies of the time of Ahaz. In them the invasion of Pekah and Rezin and the Assyrian intrigues and movements of the time are especially prominent.

The Prophecies in Zechariah ix.-xiv.—The relation of these chapters to the earlier chapters of the Book of Zechariah will be considered in its proper place. For the present we have to notice the historical situation presented in them. Chaps. ix.-xi. are a discourse entitled "The Burden of the Word of Jehovah in the Land of Hadrach," while chaps. xii.-xiv. are entitled "The Burden of the Word of Jehovah upon Israel."

In the first of these two discourses the following are among the noteworthy points: "Hadrach" occurs only here in the Bible. The name is used about in the same way with such names as Hamath, Damascus, Samaria, in the Assyrian inscriptions, in connection both with Menahem and with Pekah. The time of the prophecy was during the Assyrian period, x. 10, 11. It was when the kingdoms of Israel and Judah were both in existence, that is, before the downfall of Samaria, ix. 10, 13; x. 6; xi. 14. According to the traditional translation of ix. 2 it was a time when Hamath was the border of Israel, and therefore before the empire of Jeroboam II. had utterly gone to pieces. Like Joel and Amos, this discourse groups together Tyre, Sidon, Ashkelon, Gaza, Ashdod, and Ekron, as having certain relations with Judah, but, unlike them, omits Edom, ix. 1-8. Like Joel, it has something to say concerning the Greeks, ix. 13. A short time previously there had been in existence "my covenant which I made with all the peoples," and this covenant had now been broken, xi. 10. There had also been "brotherhood," now broken, between Judah and Israel, xi. 14; cf. ix. 10, 13; x. 6. The "exactor" has been passing through upon the temple at Jerusalem, perhaps by way of Philistia, ix. 8; x. 4. Apparently, there has been a great recent defeat of Ephraim and Judah combined, ix. 10. (Translate thus: "And though I cut off chariot from Ephraim, and horse from Jerusalem, and battle-bow be cut off, yet he shall speak peace," etc., cf. Hos. i. 7; ii. 20 [18]), the prisoners being now confined in dry wells and such places (ix. 11, 12). Israelites from Gilead and Lebanon have been sown among the peoples, and their return is promised, especially from Assyria and Egypt (x. 8-12; cf. Hos. vii. 16; ix. 3-6). The Israelites are now the "flock of slaughter," and therefore "the most miserable of sheep" (xi. 4, 7), especial emphasis being laid upon certain mercenary transactions by which they became so (xi. 5; cf. Hos. viii. 9; 2 Kings xv. 19). It is a time of bad "shepherds," and of the cutting off of shepherds (x. 2, 3; xi. 8, 16, 17). On the whole the situation is pretty sharply that of the later years of the reign of Uzziah, either shortly before or shortly after the death of Menahem.

The discourse concerning Israel, Zech. xii.-xiv., is, notwithstanding its title, exclusively concerned with Judah. It is late enough in date so that it can refer to the earthquake in the days of Uzziah as a thing of the past, but early enough so that people then living had fled from the earthquake (xiv. 5). That is to say, it is a generation later than Amos (Amos i. 1). It is enough later than the previous discourse so that the attitude of the surrounding peoples, then somewhat undecided, has now become one of positive hostility (xii. 2; xiv. 12, 16, etc.) In fine, it contemplates a condition of things like that of the reign of Ahaz, as delineated in Kings, Chronicles, and Isaiah vii.-xii.

The prophets of this earliest group all preach, prominently, the doctrine of "the day of Jehovah." In Joel and Obadiah it is mainly a day of judgment for the nations and of rescue for Israel. In Amos, Hosea, Isaiah, and Zechariah it is the same, but is also a day of judgment for Israel, a day of dread, as well as a day of gladness. It would be a mistake, in any of these prophets, to refer it to any particular event in such a way as to exclude its application to other events. It is an eternal judgment day, always impending, and perpetually repeating itself. The conception of it in the minds of the prophets, from Joel onward, is large enough to include and justify the largest New Testament use of their language.

Even more prominently than their preaching of the day of Jehovah these prophets preach the covenant promises made to Israel. In connection with this they all allude very abundantly to the events, the institutions, and the phraseology of the various parts of the Pentateuch.

Beginning with Amos, they preach the promises made to David, combining this in their preaching, with the doctrine of the day of Jehovah, and the promise to Israel, *e. g.*, Amos ix. 11; Hos. iii. 5; Isa. ix. 7; Zech. xii. 7, 8, 10, 12; xiii. 1. The Israelite prophets are as distinct in this as the Judahite. Here again the person mentioned is commonly not some particular king of the house of David, but the seed of David as promised, an eternal seed, including, of course, all particular kings in the line, but always anticipating something yet greater in the future. It is true to the stirring scenes in which these prophecies were uttered that they sometimes make splendid promises of victory won in battle, over Israel's enemies, *e. g.*, Zech. ix. 13-16. But far more prominently they insist upon the sway of the seed of David as that of a prince of peace, having universal dominion, *e. g.*, Zech. ix. 9, 10; Isa. ix. 6, 7; xi. 1; ii. 2-4, etc. This conception of these prophets stands out in striking contrast with the scenes by which they were surrounded.

The Prophets of the Later Assyrian Period.—These are Isaiah, Micah, and Nahum. In the sixth year of Hezekiah, the political power of the Northern kingdom was finally extinguished by Sargon, king of Assyria. Sargon was succeeded on the throne by his descendants Sennacherib, Esar-haddon, and Assurbanipal. Hezekiah was succeeded by Manasseh, Amon, and Josiah. For most of this period the Assyrian records are abundant and throw great light on the Bible. The chronology of these records synchronizes very closely with that of the Bible, rightly understood, though the contrary is sometimes asserted.

According to Mic. i. 1, Micah prophesied in the days of Jotham, Ahaz, and Hezekiah. Those of his prophecies that are recorded, however, all belong to the days of Hezekiah, and mainly to the six years of Hezekiah's reign that elapsed before the downfall of Samaria, *e. g.*, i. 6; iii. 12; Jer. xxvi. 18. From the rebukes uttered by Isaiah and Micah at this period, Prof. W. Robertson Smith in the article in the *ENCYCLOPEDIA BRITANNICA* infers "the conclusion that Hezekiah was not from the first a reforming king," as the accounts in Kings and Chronicles represent him to have

been; but the premises justify no such conclusion. If Hezekiah was from the first a reformer, it does not follow that he would be able by a pen-stroke instantly to annihilate the evils of the times, so that there would no longer be these evils to rebuke. It is more natural to think that there would be a struggle, and that he would need all the aid these prophets could give him in carrying out his purposes of reform. The alleged contradictions between Isaiah and Micah, and between Mic. iv. 9, 10 and iv. 11-13, are not contradictions, but the presentation of different aspects of the same fact. When we remember that Tiglath-pileser and the kings of the Sargon dynasty claimed it as a special glory that they were kings of Babylon as well as of Assyria, and that some of the immigrants to Samaria were brought from the Babylonian regions, we see that there is nothing in the words, "thou shalt come even to Babylon," Mic. iv. 10, to justify the charge of interpolation, or of the presence of a later hand than Micah's. The idea that Mic. vii. 7-20 is post-exilic is sufficiently refuted by the mention of Assyria in verse 12, and the alleged difference of situation between chaps. vi.-vii. and the previous chapters does not exist except on the assumption that people of different characters cannot live in the same country at the same time.

Nahum is not formally dated. As it consists largely of threats against Assyria, it evidently belongs to the Assyrian period. If it were necessary to refer iii. 8-10 to the taking of Thebes by Assurbanipal, that would prove the prophesying of Nahum to have been in the latter part of Manasseh's reign, or later, but the sacking of Thebes referred to may be an earlier event. Josephus says, very circumstantially, that Nahum's prophecy was uttered in the reign of Jotham, 115 years before the fall of Nineveh (*Ant. IX., xi. 3*).

The Prophets of the Babylonian Period.—These are Zephaniah, Habakkuk, and Jeremiah in Palestine, and Ezekiel in Babylonia. No one knows just when the downfall of Nineveh occurred, but the power of Nineveh in Palestine evidently ceased from early in the reign of Josiah. The first three of the prophets just named began to prophesy in the interval between the loosening of the hold of the Assyrian over Judah and the rise of the Babylonian supremacy. The Book of Zephaniah is, like Joel, a monograph on "the Day of Jehovah." It is best regarded as consisting of three parts—a threat of judgment, i.; an exhortation to repentance, ii. and iii. 1-8, and a promise of salvation, iii. 9-20. It is dated "in the days of Josiah," i. 1. Havernick, Ewald, De Wette, Jahn, and others regard it as belonging to the first eleven years of Josiah's reign, the years before his reformation began. Keil, Witsius, V. Coeln, Knobel, Hitzig, E. Meier, Strauss are quoted as assigning it to the middle seven years of Josiah, the years when his reformation was in progress, and Delitzsch, Bertheau, Klein, and Kleintert, as assigning it to the later years of Josiah, after the reformation had become an accomplished fact. The evidence can hardly be regarded as decisive in favor of either view. Such passages as i. 4, 6, seem to imply that there had recently been a reformation, which had reduced the worshippers of Baal to a remnant, and that still more recently there had been some apostasy on the part of those who had reformed. If it were certain that the reformation here referred to is that of Josiah, that would be decisive as to the date of the book; but this reformation is quite as likely to be that of the later days of Manasseh, 2 Chron. xxxiii. 12-17, with the apostasy that followed in the days of Amon. Taking this view of the matter, there is a preponderance of probability in favor of the opinion that Zephaniah prophesied early in Josiah's reign, and that we have here one of the discourses by which public opinion in Judah was influenced in favor of undertaking the reformation.

Concerning Habakkuk, it need here only be noted that this prophecy is dated by its affiliations with Zeph-

aniah and Jeremiah, as belonging, probably, to the later years of Josiah.

The Book of Jeremiah, as it now exists, is more fully provided with a system of titles and sub-titles than any other book of the Old Testament. Following these, or classifying by them, the book consists of five parts: The first part, chaps. i.-xx., contains six collections of sketches of prophecies (i. 4-iii. 5; iii. 6-vi.; vii.-x.; xi.-xiii.; xiv.-xvii.; xviii.-xx.). Each collection includes several sketches, some of the prophecies being sketched in a sentence or two, and others given quite in full. The sketches mingle poetry and prose in the most unexpected ways, and are remarkably uneven, both in literary character and in the topics discussed. The first two of these collections are dated as belonging to the reign of Josiah; the third is identified in chap. xxvi. as containing the group of prophecies for which Jeremiah was prosecuted early in the reign of Jehoiakim; the other three are not dated. The second part, chaps. xxi.-xxxvi., is a series of dated narratives and addresses, each complete in itself, in an order which seems to be entirely miscellaneous. The third part, chaps. xxxvii.-xliv., is a continuous narrative of the times of the destruction of Jerusalem by Nebuchadnezzar, including some discourses. The fourth part, chaps. xlv.-li., is a collection of poems, which might be entitled "The Book of Woes upon the Nations." The poems contained in it are of different dates, but they have a common character. The fifth part is the historical appendix, chap. lli. Whatever there may be that is puzzling in the present order of the book, it seems at least to be clear that the man who put the book together had in his possession the first, third, fourth, and fifth parts, each complete in itself, and also the various discourses that compose the second part; he first arranged the completed parts, in the order which was on the whole the most natural, and then put the remaining separate discourses in the place where, as a whole, they belonged, without arranging them, relatively to one another, in the order of time.

The first collection of the first part of Jeremiah contains sketches of five different prophecies, each introduced by the formula, "And the word of Jehovah was unto me, saying." The five sketches are i. 4-10, 11, 12, 13-19; ii.; iii. 1-5; the introductory formula being incomplete in our text in iii. 1. Here and in the following collections it is at once evident that we have not, ordinarily, the full text of each prophecy, written out in the words in which the prophecy was originally uttered, but a mere sketch of the prophecy, made for some purpose, at a later date. What should we expect to find different from these collections, if we could recover the roll said to have been written by Baruch, Jer. xxxvi. 32? The different roll mentioned in xxxvi. 2-26, the roll which the king destroyed "when Jehudi had read three or four leaves," can hardly have been so brief a document as Graetz supposes, when he says that it was merely the prophecy now found in chap. xxv. A resumé of the prophet's utterances for many years would give weight to his testimony, even if it included much besides direct threatenings as to what the king of Babylon would do to Judah. It is not good reasoning to substitute conjecture for testimony, in cases where there is no more difficulty with the testimony than there is here.

In the argument as to the authorship of Jer. lli., it should be kept in mind that the accession of Evil-merodach was but sixty-six years after Jeremiah began to prophesy, he being then a "child" (i. 6). We have no information as to how long Jeremiah lived. It is true that Ezekiel was his "late contemporary," but we do not know which of the two died first, and most of the Book of Ezekiel is dated either before the destruction of the temple, or very soon after that event, that is to say within the probable lifetime of Jeremiah.

The article on EZEKIEL in the *ENCYCLOPÆDIA*

BRITANNICA includes a good many dates from the Christian era, given according to the commonly accepted scheme of chronology. If any one will take the trouble to compare the Biblical dates with those of the Canon of Ptolemy, and will do the work correctly, he will find that all these dates are too large by two; that is, for example, the date of the exile of Jehoiachin was B. C. 597, instead of B. C. 599. The difference is important, not for the times of Ezekiel only, but for all dates concerning the prophets, or concerning the history, back to the time of the downfall of Samaria. For all this period, the dates B. C. accepted by the Assyriologists are based on the Canon of Ptolemy. As a matter of fact, if we reduce the Biblical dates to the same standard, we transform many a supposed general and vague synchronism between the Biblical and the Assyrian records into an exact synchronism.

The connecting of Ezekiel's forty years with his frequently repeated prophecies of the restoration of Judah is, it should be remembered, a matter of interpretation, and not of direct statement by him. Whatever may be true as to Kuenen's having proved the traditions concerning the Great Synagogue to be unhistorical, no history is more veritable than much of the tradition concerning Ezra, Nehemiah, and some of the other men who are often called "the men of the Great Synagogue;" and it is the traditions concerning the men, and not those concerning the organization, that are mainly important as evidence in regard to the completing of the Scriptures. According to the traditions, Ezekiel's contemporaries, Daniel, Shadrach, Meshach, and Abed-nego were among the men of the Great Synagogue. Ezekiel himself is likely enough to have been one of the number. There is no reason for doubting the essential fact in the tradition concerning Ezekiel, namely, that the men of the Great Synagogue are responsible for its existence as a literary work.

As to the relations of Ezekiel to the Pentateuch, his holy land, holy city, temple, and ritual are all largely symbolical, for they are full of specifications that are palpably impossible, if we try to understand them as literal facts; the strong literary resemblances between Ezekiel and certain parts of the Pentateuch are readily accounted for by the fact that the prophet was evidently a man of narrow reading, whose style was greatly affected by those writings to which he paid especial attention; Ezekiel is distinguished from every part of the Pentateuch, by the fact that the Babylonian *locus* of the author never for a moment disappears from Ezekiel, and never sharply appears in the Pentateuch; and by the fact that Ezekiel throughout presents linguistic peculiarities different from those found in the Pentateuch. The relations of Ezekiel to the Law are admirably discussed by Dr. Frederic Gardiner, in the *Journal of the Society of Biblical Literature and Exegesis* for 1881.

The Post-exilic Prophets.—These are Haggai and Zechariah, each containing several short prophecies, dated by certain days of certain months in the reign of Darius Hystaspes, and Malachi, dated by its contents, its position in the canon, and tradition as from the latest period of the Old Testament canon, that is, from the latter part of Nehemiah's second administration in Jerusalem. By the plan on which the present articles are written, these books require no extended notice. Any reader who will carefully examine the references given in the article on HAGGAI in the *ENCYCLOPÆDIA BRITANNICA* will see that, really, there is no conflict between the statements made in Haggai and those made in Ezra, as to the restoration of the temple, but that, on the other hand, the prophecies of both Haggai and Malachi presuppose that the builders had had especial hindrances and difficulties, and that the hindrances mentioned in Ezra exactly fit the case.

We have already noted the fact that the two prophecies in Zech. ix.-xiv., although they immediately

follow eight chapters dated in the reign of Darius, yet present distinctly the historical situation of the times of Uzziah and Ahaz. This would be accounted for if we suppose that two independent books have here been arbitrarily joined, or if we suppose that the Zechariah of the times of Darius wrote both, but, in writing ix.-xiv., put himself back to the point of view of the earlier time, or if we suppose that he possessed the earlier work, and edited it into his own book, or very likely in other ways. Among the various possible theories, it is not necessary here to decide; with the facts clearly in mind, the question as to how the facts are to be accounted for is a question that can wait.

The present writer, having in mind the fact that this article is to be supplementary to those in the *ENCYCLOPÆDIA BRITANNICA*, has regarded it as ordinarily unnecessary to repeat the details that are given, and often admirably given, in those articles. Nor has he regarded it as his duty to controvert every point in which those articles present views different from those held by most American evangelical scholars. Much less has he attempted the limitless task of arguing all such questions. The reader who really desires to get at the truth should carefully look at the evidence for himself, on both sides of these controverted questions. But there is one line of statements that requires a brief additional consideration. In regard to nearly every one of the prophetic books the reader will observe that the various writers in the *BRITANNICA* make two affirmations: first, that the text is corrupt, containing errors and interpolations, and needing emendation; secondly, that the book shows marks of having been worked over, changed from its original form by additions, omissions, and the piecing together of parts that originally did not belong together. In the instances where these writers are cautious and avoid these affirmations, some other living writers are less cautious; there is probably no prophetic book, and indeed no book of the Old Testament, in regard to which a certain class of critics do not confidently assert both that the text is in need of emendation, and that the book has been worked over since it was written. These points are raised in connection with a multitude of instances throughout the prophetic books; it has been impossible to notice the instances separately as they arose, and is now impossible to discuss the points at length. But by all fair laws of critical reasoning, most of the instances are mistakes, and, in general, the inferences drawn from them are not well drawn. All questions of this sort have a right to be examined and decided by the evidence. But presumptively, phenomena that characterize every part of a literature are to be regarded as the ordinary phenomena of that literature, and not as marks of text-corruption or of complicated redaction. In the books of the prophets, the fair application of this principle will sweep away nearly all the alleged instances of these.

Literature.—Among accessible commentaries that treat of the prophetic books, those of the Lange series and those of the Keil and Delitzsch series are full and valuable. The successive volumes of the *Cambridge Bible for Schools* are highly prized. The successive issues of the *Old Testament Student* from January, 1888, contain notices of the prophetic books with references to the literature; and the same periodical has for some years published a monthly list of publications concerning the Old Testament, including, of course, the prophetic parts of it. Dr. W. H. Green's book, *Moses and the Prophets*, includes reviews of the volumes of Kuenen and of W. Robertson Smith. Orrell's book on *Old Testament Prophecy* has attained wide celebrity. An especially valuable compact discussion of the most important questions concerning the prophets and prophecy is contained in several of the lectures in *The Old and New Testaments in their Mutual Relations*, by the Rev. Frederic Gardiner, D. D. *Messianic Prophecy*, by the Rev. C. A. Briggs, D. D., is fresh and brilliant, and of very great value for many purposes. The various Bible Dictionaries and Religious Encyclopædias contain full lines of articles on these subjects, with lists of the literature; the literary lists in the *Schaff-Herzog Encyclopædia* are especially rich. PROTECTION. See **FREE TRADE** and **POLITICAL ECONOMY**.

PROVERBS, BOOK OF. See **SOLOMON**.

PROVOOST, SAMUEL (1742-1815), bishop of the American Episcopal Church, was born in New York city, March 11, 1742, being of Huguenot descent. After graduating at King's (now Columbia) College in 1758 he went to England, studied, and graduated at Cambridge University, and was admitted to orders in 1766. Returning to New York he was made assistant minister of Trinity Church, but in 1770 retired to a farm in Dutchess county. During the Revolution he favored the American cause, but took no active part. On the evacuation of New York by the British in 1783 he became rector of Trinity Church, and in 1785 he was chaplain to the Continental Congress. In 1786 he was elected bishop of New York, and in company with Dr. William White, who had been elected bishop of Pennsylvania, went to England and was consecrated at Lambeth palace, Feb. 4, 1787. Returning to New York, he continued his work as rector of Trinity Church until 1800, when he resigned on account of his infirm health. He also resigned his bishopric in the next year, but the resignation was not accepted, though Rev. Dr. Benjamin Moore was chosen his assistant. Bishop Provoost died Sept. 6, 1815.

PRYOR, ROGER ATKINSON, Confederate general and lawyer, was born near Petersburg, Va., July 19, 1828. He graduated at Hampden-Sidney College in 1845, and at the University of Virginia in 1842. He was admitted to the bar and was also active in journalism in Petersburg, Washington, and Richmond. In 1854 he was sent as a special commissioner to Greece. In 1857 he was elected to Congress, where he threw all his youthful ardor into the advocacy of extreme Southern claims. A noted incident of his career as representative was his challenge of John F. Potter, of Wisconsin, who selected bowie-knives as the weapons, but no duel was fought. Pryor joined Gen. Beauregard's staff at the attack on Fort Sumter. On the secession of Virginia, he was sent as delegate to the Confederate Congress, but he soon entered the army with the rank of colonel. He was promoted brigadier-general in 1862, and led a division in the defence of Richmond against McClellan. He resigned from the army in August, 1863, and being taken prisoner in November, 1864, was confined for a short time in Fort Lafayette, in New York harbor. Since the close of the war he has been a lawyer in active practice in New York city.

PSALMS. "As regards the dates and historical interpretation of the Psalms, all older See Vol. XX. discussions, even those of Ewald, are p. 29 (p. 33 in great measure antiquated by recent Am. Rep.). progress in Pentateuch criticism and the history of the canon." This statement, taken from the last sentence of Prof. W. Robertson Smith's article on the **PSALMS** in the *ENCYCLOPÆDIA BRITANNICA*, defines his point of view. The psalms which by their titles, their apparent contents, and external testimony, are attributed to David and his contemporaries, contain hundreds of allusions to the various parts of the Hexateuch. If any considerable number of the psalms were actually written in the times of David, then the whole Pentateuch had been previously written. But if the view of Pentateuchal criticism presented in the successive volumes of the *BRITANNICA* is correct, then most of the psalms are not only post-Davidic, but post-exilic, and the completion of the Psalter cannot have been earlier than the Maccabean times. It is well to have this issue sharply presented. But unless one assumes that the post-exilic origin of the Hexateuch is a proven fact, the reasons are very weak for assigning a majority of the psalms to a date later than David, or any of them to a date later than Nehemiah.

It is conceded that the contents of a psalm may have more weight, as evidence of its date, than any external evidence that can ordinarily be cited. Pa.

cxlvii., for example, with its picture of the children of Zion weeping by the rivers of Babylon, was evidently written after the beginning of the Babylonian exile, and apparently within the lifetime of some of the very persons whom Nebuchadnezzar had carried away. And this case shows us what we are to expect in other cases. The writers of the Psalms were not men who took pains to cover up the signs of the date when a psalm was written. If a psalm is really of late date, it is likely, in most cases, that there will be, as there is in Ps. cxlvii., some evident and distinct sign of that fact. The absence of such signs has weight against attributing a late date to a psalm. But if any one will take pains to examine the reasons that are given when it is proposed to assign an apparently Davidic psalm to later ages, or any psalm to a date later than Nehemiah, he will find that the reason, in most instances, is not very distinct or very strong; in many instances it is as attenuated as possible.

The fact, for example, that a psalm mentions the temple or its service is no strong proof of its having originated later than David. To say nothing of the earlier temple of Eli's time, the accounts of the reign of David inform us that he and other devout Israelites used much time and treasure, making preparations for the temple that was to be built by his successor, and arranging for its services. Nothing could be more natural, during this period, than that a sacred poet should look forward to the times when the proposed building and its ritual should be in existence, mentioning them in his song.

Nor is a psalm proved to be of post-exilic origin by its speaking of Israel as in distress, or as needing to be saved, or even of Israel as scattered among the nations. At half a dozen different periods between the reign of David and the Babylonian exile the history of Israel or Judah was such that language of this sort would be appropriate. During the later years of Saul, and the earlier years of David, there was a period of this sort; witness the battle of Gilboa, and, later, the two desperate attempts of the Philistines against David, after he took the throne of all Israel. War always means the driving of people as fugitives from their homes; wars in ancient times involved the selling of the conquered into slavery. Nothing could be more superficial than to regard every expatriated Israelite spoken of in the Bible as an exile of Nebuchadnezzar's time. There never was a century of Israelite history that had not its own cases of this sort.

Nor is a psalm proved to be post-exilic by the fact of its containing Aramaic or Syriac peculiarities of language, nor even by its containing peculiarities that are also found in prose in the later Hebrew. No fact is more familiar than that the poetic forms of a language, or of one period of a language, are apt to show affiliations with the prose forms of some cognate language, or of some different period. The colloquialisms of one language or period correspond to the literary usage of a cognate language, or a different period. The times of David were times when the Israelites were rapidly changing in culture, and largely through the fact of their having conquered certain Aramaean peoples more cultured than themselves. In the circumstances, the literature of the times of David ought to show the marks of the times. And later, in the times of Benhadad, Hazael, and the successive Assyrian conquerors (see 2 Kings xviii. 26), there existed facts that might easily account for linguistic peculiarities of this sort.

Nor is a psalm proved to be non-Davidic by its not having a title, in the Hebrew, attributing it to David. We have no sufficient knowledge as to the origin of the titles to justify any inference of this sort. It is easy to say that the collectors of the psalms would naturally ascribe a psalm to David, if they knew of the least shred of evidence to justify them in doing so; and that their failing to do so therefore shows that no evidence existed in their day; but of this we have no proof.

As a matter of fact, several of the psalms that are most specifically attributed to David in the New Testament and in the Books of Chronicles are those that have no titles.

A psalm is not necessarily proved to be of late date by agreements of its phraseology with that of passages in the later books. Nothing could be more natural than that the authors of these later books should quote the psalms. Nothing could be more natural than that they should be so familiar with the national sacred songs that their own phraseology should be influenced thereby, even when they made no formal quotations.

The positive proof that a majority of the psalms date from the lifetime of David and of men who were contemporary with him, that a large proportion of the rest are pre-exilic, and that none are later than the possible lifetime of Nehemiah, includes many different items, and applies differently to different psalms. Of course it is possible here to consider this evidence only in general.

The Testimony of the Hebrew Titles.—To begin with, the Hebrew titles of about ninety psalms (the same titles that are found in the English versions) contain the name of David or of one of his contemporaries, Asaph, Heman, Ethan (or Jeduthun), or Solomon. Save in a very few instances these titles are corroborated by the Septuagint, and the various copies of this version also prefix the name of David to a considerable number of the psalms where it is not found in the Hebrew. It is not necessary, in all cases, to suppose that the man who wrote the title intended to be understood that the man named in the title is the author of the psalm. Supposably, the words "to David," prefixed to a psalm, might mean, not that David wrote the psalm, but that he is the subject of it, or that it was dedicated to him, or that it was regarded as Davidic in its character, or that it belonged to a collection that was considered as in some sense Davidic; and there are other ways in which a psalm might be regarded as Davidic, though not written by David. Any one who will look up the Septuagint titles to the psalms with care will readily see that, in some cases, the Septuagint writers and annotators did not regard the man named in the title of a psalm as its author. But after making all due allowances of this sort, no one would dispute the statement that, prevailing, the prefixing of a name to a psalm, in its title, was intended as an indication of its authorship. In any given case, therefore, this interpretation of the title is to be preferred until reasons appear for a different interpretation.

But it is said that the titles originated in a later and uncritical age, and are therefore of little value. If it were known that they are of late origin, that would not prove them valueless, but would merely open the way for proving them so; on comparing them with other evidence, external and internal, it might still appear that they were thoroughly trustworthy. But what evidence can any one adduce that the titles are of late origin? This is a thing to be proved, not to be assumed. The titles have been there as far back as we can trace the psalms themselves. In the Hebrew, they are printed with nothing to distinguish them from the rest of the psalm: if a title is long enough to make a verse, it is numbered as the first verse of the psalm, and not, as in the versions, as a separate paragraph. No one has a right to reason from the premises that the titles are some centuries, or some generations, later than the psalms to which they are prefixed, until he has first proved these premises.

But it is said that the titles are inconsistent with the contents of the psalms to which they are prefixed, and are by this shown to be unhistorical. If this inconsistency really exists, in some cases, then it shows that in those cases the title is either erroneous or else is to be understood as indicating something else than the authorship of the psalm. But to justify this, the inconsistency must be clearly made out, not slimly guessed

at. "To refer Ps. lii. to Doeg, Ps. liv. to the Ziphites, Ps. lix. to David when watched in his house by Saul, implies an absolute lack of the very elements of historical judgment." The question which displays the greater lack of historical judgment, the man who wrote these titles, or the man who made this remark concerning them, may safely be left to the decision of any intelligent reader who will read carefully, in each case first the passage referred to in Samuel, in its full connection, and then the psalm referring to it. In none of the cases does the psalm contain a description of the incident referred to, so that some later editor would be likely to identify the psalm with the incident; but in each case the psalm delineates thoughts and feelings such as might naturally arise from the incident, in an earnest, religious young man, who held somewhat large views in regard to God's purposes with Israel.

"There is a whole series of hymns in which the writer identifies himself with the poor and needy, the righteous people of God suffering in silence at the hands of the wicked, without other hope than patiently to wait for the interposition of Jehovah (Ps. xii., xxv., xxxvii., xxxviii., etc.). Nothing can be further removed than this from any possible situation in the life of the David of the books of Samuel." On the contrary, if any one will carefully read what the books of Samuel say concerning David and his relations with Saul, up to a point of time when David had become a fugitive, but before the time of his defection to the Philistines, he will see that the Twelfth psalm accurately fits a situation in the life of David. If any one will get distinctly into mind the situation of David in the period after his domestic troubles began, say from the time of the murder of Amnon by Absalom to the close of David's life, and will observe the extent to which David had brought these troubles upon himself, by practising polygamy, by the sin with Uriah's wife, and in other ways, he will see that just such a situation as this is the situation contemplated in such psalms as the Twenty-fifth and Thirty-eighth. If he will think of David in these later years, repentant, but bound fast to such men as Joab, Absalom, Ahithophel, by bonds that were partly creditable, but partly discreditable, he will find a situation that fits the Thirty-seventh psalm, as it also fits the shorter psalm found in 2 Sam. xxiii. 1-7.

"Even the bare names of the old history were no longer correctly known when Abimelech (the Philistine king in the stories of Abraham and Isaac) could be substituted in the title of Ps. xxxiv. for Achish, king of Gath." But if this argument proves anything, it proves that this title has not yet been written, and never will be; for the time has not yet come when the name of Achish is "no longer correctly known." Whatever explanation may be given for the variation of names here (variant names are too common in the Old Testament to require much explanation), there is nothing in it that has the slightest weight to prove either that the title was written after the name of Achish was forgotten, or that the title is unhistorical.

"Ps. xx., xxi. are not spoken by a king, but addressed to a king by his people." If this were true, it would prove nothing against the Davidic authorship of these psalms; why should not this poet, like other lyric poets, sometimes write from the point of view of others, especially when he writes a song for others to repeat and sing? But Ps. xxi. bears every mark of having been written by the king in question, as well as to the king.

"The titles which ascribe four of the pilgrimage songs to David and one to Solomon are lacking in the true LXX., and inconsistent with the contents of the psalms." Considering the extent to which the copies of the Septuagint differ both among themselves and with the Hebrew, no one should regard the omission of these titles by the Septuagint as very significant. As to whether the contents of these psalms are incon-

sistent with their coming from David and Solomon, that can best be decided by any one for himself, by reading the psalms in question. They are Ps. cxxii., cxxiv., cxxxi., cxxxiii., and cxxvii. Any ordinary reader, reading with this question in mind, will probably decide that the sentiments of these psalms are such as would come with peculiar appropriateness from David and from Solomon.

"The notes struck in the Lamentations and in Isaiah xl.-lxvi. meet our ears again in not a few psalms of book I." The psalms cited in proof of this are xxi., xxv., xxxiv., xxxv., xxxviii., xli., and xxi."

"with many points of resemblance to Jeremiah." "Other psalms of the collection treat the problems of individual religion in the line of thought first opened by Jeremiah. Such a psalm is xxxix. and above all Ps. xvi." But the phenomena referred to in these statements are best explained by the view that these psalms were already ancient in the times of the prophetic authors mentioned, and were familiarly known to them as the ancient sacred songs of the nation. It follows that "the line of thought" alluded to was not "first opened by Jeremiah," but was found by Jeremiah in the Davidic psalms, and used accordingly.

If any reader of the preceding paragraphs takes the trouble to verify them by carefully reading the passages of Scripture referred to, he will probably find himself wondering how any man could possibly be led to make such statements as those that have been quoted; perhaps the fact that the misstatements in the quoted passages are so very palpable may lead him to question whether the present treatment of them is not one-sided and unfair. But to explain this puzzling fact, he need only plant himself at the point of view from which the quoted statements are made. If it were true that the Pentateuchal legislation came into existence long after the times of David, and the ceremonial parts of it mostly after the exile, then it would be true that all the psalms that mention this legislation are of correspondingly late date. Again, those who hold, as a fundamental part of their theory of the origin of the Hexateuch, that literary and humane culture in Israel practically began several generations later than David, are obliged so to understand the history of the times of David that it will be consistent with their view. It is a part of their work to analyze, emend, and correct the books of Samuel, to submit these books to what they call a process of sifting, so as to make the books conform to the truth, as the truth seems to them. The statements quoted above in regard to the character of David and his times are based, not on the books of Samuel as found in the texts, but on what these critics understand to be the credible portions of the books of Samuel, interpreted according to a certain scheme for the historical development of Israel. Facts like this at once account for the statements that have been quoted, and corroborate the reasons that have been given for condemning them.

The article in the *ENCYCLOPÆDIA BRITANNICA* regards Ps. li. as a psalm of the exile, purely on the ground of its mentioning, in the last two verses, the offering of sacrifices and the building of the walls of Jerusalem; but according to the historical books of the Bible these marks fit David's time. From the mention of Zebulon and Naphtali along with Benjamin and Judah, in Ps. lxxviii. 27, it infers that this psalm must have been written later than Nehemiah's time; but, according to the historical books, this mark accurately fits the time of David. It is useless to multiply examples. Evidently, the reasons alleged to discredit the titles of the psalms have no great weight, and the titles remain, as a whole, historically credible.

The Testimony of the New Testament.—In many different passages the New Testament books connect the name of David with the following psalms that have this name in their titles: Ps. xvi., xxxii., lxxix., cix., cx. (see Concordance), and also with Ps. ii., cxxxii., and xc., which are anonymous in the Psalter. The

last instance appears in Heb. iv. 7: "Saying in David, after so long a time . . . To-day if ye shall hear his voice, etc." In this case it would not be difficult to understand the writer as merely citing the book that commonly went by the name of David; not necessarily as testifying that David wrote the particular psalm here cited. But in all the other instances the personal attribution of the psalm quoted to David is, verbally, at least, and, to all appearance, really, as explicit as possible. See, for example, Acts ii. 25, 29, 34, or iv. 25, 26. If this testimony is to be believed (and there is no reason for disputing it, even apart from all supernatural claims made for it), it confirms the titles to five of the psalms, thus incidentally confirms the testimony of the titles in general, adds Ps. ii. and less distinctly Ps. cxxxii. (Acts vii. 46) to the list of those written by David, and strongly points out David as pre-eminently the great writer of psalms.

The Testimony of the Books of Chronicles, Ezra, and Nehemiah.—These books testify to the personal existence, in David's time, of the singers Asaph, Heman, and Jeduthun, whose names appear in the titles of certain psalms, and that their function as singers was handed down from the times of David, 1 Chron. vi. 33, 39; xv. 19; xxv.; 2 Chron. v. 12; xx. 14; xxix. 13, 30; xxxv. 15; Ezra ii. 41; iii. 10; Neh. vii. 44; xi. 17, 22; xii. 35, 46, and many other passages. In these same passages they testify to David's personal interest in sacred song. They testify to the public use in Israel of a group of songs giving thanks to Jehovah because his loving-kindness is forever (such songs as Ps. cvi., cvii., cxviii., cxxxvi., all anonymous) from the time when David brought up the ark to Jerusalem, and onward, 1 Chron. xvi. 34, 41; 2 Chron. v. 13; vii. 3, 6; xx. 21; Ezra iii. 11, etc. In 1 Chron. xvi. 7-36 it seems to be asserted that Ps. cv., xvi., and cvi. were placed by David in the hands of his singers at the time when he brought the ark to Jerusalem; and in 2 Chron. vi. 41, 42, it seems to be affirmed that Ps. cxxxii. was used at the dedication of the temple. These four psalms are anonymous in the Hebrew; the Septuagint calls Ps. xvi. Davidic, and connects it in some way with the building of the "house after the captivity;" as we have seen, Ps. cxxxii. is alluded to in Acts vii. 46, as containing sentiments of David.

This evidence is at some points lacking in explicitness, but there can be no doubt that it recognizes David as the great original writer of psalms, that it associates Asaph and the others with David, or that it attributes to them a group of psalms, mostly of liturgical character, which can be quite plausibly identified with several of our present psalms that have not David's name in their titles.

But it is alleged that the books containing this evidence are of late date, and take an uncritical view of the history of David's time, attributing to it the characteristics that belonged only to the second temple and its worship. That the books are relatively of late date is true, though there is no proof that they are later than Nehemiah: whether they are untrustworthy is a different question. So far as their testimony to the Psalms is concerned, it fits in well with what other evidence there is in the case. Many conservative scholars, indeed, admit that Ps. cvi., among those testified to in Chronicles, cannot be of David's time, because of its closing lines:

"He made them also to be pitied,
Of all those that carried them captives.
Save us, O Lord, our God,
And gather us from among the nations."

But if it were sure that these words refer to the Babylonian exile, it would be easy to regard them as an addition: and it is not at all sure that they have any such reference. At the time when David brought up the ark, a few years after the close of a series of Philistine invasions that had lasted for a generation, it is

certain that there were yet Israelitish fugitives, both slaves and sojourners, scattered in the neighboring countries; on that joyful occasion, why should not the minds of the people turn to these, their suffering brethren, just as naturally as if they had lived several hundred years later?

Other Testimony.—The testimony of the psalm-titles, the New Testament, and the Books of Chronicles is confirmed by many incidental notices in the earlier books. Psalm cxxxvii. distinctly presupposes that Judah, before the time of the exile, had well-known songs of Zion. The songs giving thanks to Jehovah because his loving-kindness is eternal are alluded to as something familiarly known in Isa. liv. 8; Jer. xxxiii. 11. In the times of Amos the name of David was celebrated among lovers of music and song, Amos vi. 5. In 2 Sam. xxii. the Eighteenth psalm is attributed to David, and the habit of lyrical production is ascribed to him in 2 Sam. xxiii. 1-7; i. 17, seq.; iii. 33, 34. According to 1 Sam. xvi. 14-23, etc., David's first entrance into public life was due to his celebrity as a skilled musician. Facts like these have no small value as corroborative evidence.

Considerable additional testimony, dating earlier than the Christian era, might be drawn from the Septuagint translation, from the additional titles to the psalms found in the Septuagint, and from the Apocrypha and the other Jewish-Greek literature, and it would all be to the same effect with that already cited. As contradicting the idea that some of the psalms are later than the Persian period, it may be noticed that the Septuagint titles often contain the names of Jeremiah, Haggai, and Zechariah, but no later names. If the Septuagint translation of the psalms had not been made till nearly 130 B. C., and a good many of the psalms had then only just been written, the signs of this in the Septuagint would certainly be very different from the phenomena actually presented there.

Internal Evidence.—A full consideration would require us now to take up each particular psalm, comparing its internal phenomena with the evidence at which we have been looking, and reaching a separate conclusion in the case of each psalm by itself. This we cannot do, but there are certain general facts of internal evidence that are worth looking at.

Among the psalms that are attributed to the times of David, either by their titles or by the notices in the history, are several that recapitulate the history of Israel—Ps. lxxvii., lxxviii., assigned to Asaph, cv., cvi., called Davidic in 1 Chron. xvi., cxxxvi., with the refrain "his loving-kindness is forever." In each case the psalm recapitulates the history as now found in the Pentateuch, Joshua, Judges, and Samuel, stopping with the times of David or a little earlier. The most natural explanation of this fact certainly is that the writers lived in the times of David, and brought the history up to their own times; in proof of this compare the similar repetitions in Neh. ix. or Ecclus. xlv. 1. "The view of Israel's past history taken in Ps. lxxviii., where the final rejection of the house of Joseph is co-ordinated with the fall of Shiloh and the rise of Zion and the Davidic kingdom, indicates a standpoint very near to that of Chronicles." But Ps. lxxviii. 60-64 is evidently a description of the capture of the ark and the killing of Hophni and Phinehas in Eli's time. The refusing of Joseph in the following verses is not the ultimate casting off of Northern Israel, but the transfer of the sanctuary from Shiloh to Jerusalem, from the territory of Ephraim to that of Judah. It is true that the passage "indicates a standpoint very near to that of Chronicles," in the sense that the psalm takes the same view of the history that is taken in the Books of Chronicles; but that is to be accounted for by the fact that both look at the history correctly. It has no weight at all to show that this psalm is of even date with the Books of Chronicles.

This reasoning is not necessarily vitiated by the fact

veyed in each of the States and Territories: Alabama, 51; Arkansas, 52; California, 158; Colorado, 105; Florida, 59; Illinois, 55; Indiana, 34; Iowa, 55; Kansas, 81; Louisiana, 45; Michigan, 56; Minnesota, 84; Mississippi, 47; Missouri, 65; Nebraska, 74; Nevada, 112; Ohio, 40; Oregon, 95; Wisconsin, 54; Alaska, 577; Arizona, 114; Dakota, 151; Idaho, 86; Indian Territory, 63; Montana, 144; New Mexico, 121; Utah, 84; Washington Territory, 70; Wyoming, 98; Land strip, 6; total of 2,837,000 square miles—or 1,815,504,147 acres. In each case, except Ohio, Indiana, Illinois, Indian Territory, and Alaska, land offices are established, in charge of an officer known as register of the land office, where the records of all surveyed lands are kept, and all applications concerning lands in each district are filed and inquiries answered. The public lands are divided into 2 great classes. The one class has \$1.25 an acre designated as the minimum price and the other \$2.50 an acre, the latter being the alternate sections, reserved by the United States in land grants to railroads, etc. Titles to these lands may be acquired by private entry or location under the Homestead, Pre-emption, and Timber-culture laws; or, as to some classes, by purchase for cash. In the case of lands which may be purchased at private sale, or such as have not been reserved under any law, such tracts are sold on application to the land register, who issues a certificate of purchase, the receiver giving a receipt for the money paid, subject to the issue of a patent, or complete title, if the proceedings are found regular, by the Commissioner of the General Land Office at Washington.

The following list comprises the U. S. land offices:

Alabama—Huntsville, Montgomery.
 Arkansas—Little Rock, Camden, Harrison, Dardanelle.
 Arizona—Prescott, Tucson.
 California—San Francisco, Marysville, Humboldt, Stockton, Visalia, Sacramento, Los Angeles, Shasta, Susanville, Bodie.
 Colorado—Denver City, Leadville, Central City, Pueblo, Del Norte, Lake City, Durango, Gunnison.
 Dakota—Mitchell, Watertown, Fargo, Yankton, Bismarck, Deadwood, Grand Forks, Aberdeen, Huron, Greelburg.
 Florida—Gainesville.
 Idaho—Boisé City, Lewiston, Oxford, Hailey.
 Iowa—Des Moines.
 Kansas—Topeka, Salina, Independence, Wichita, Kirwin, Concordia, Larned, Wa Keeney, Oberlin, Garden City.
 Louisiana—New Orleans, Natchitoches.
 Michigan—Detroit, East Saginaw, Reed City, Marquette.
 Minnesota—Taylor's Falls, St. Cloud, Duluth, Fergus Falls, Worthington, Crookston, Benson, Tracy, Redwood Falls.
 Mississippi—Jackson.
 Missouri—Booneville, Ironton, Springfield.
 Montana—Helena, Bozeman, Miles City.
 Nebraska—Beatrice, Lincoln, Niobrara, Grand Island, North Platte, Bloomington, Neligh, Valentine, McCook.
 Nevada—Carson City, Eureka.
 New Mexico—Santa Fé, Las Cruces.
 Oregon—Oregon City, Roseburg, Le Grand, Lakeview, The Dalles.
 Utah—Salt Lake City.
 Washington—Olympia, Vancouver, Wallawalla, Yakima, Spokane Falls.
 Wisconsin—Menasha, Falls of St. Croix, Wausau, La Crosse, Bayfield, Eau Claire.
 Wyoming—Cheyenne, Evanston.

The earliest form of grants of public lands was those to canals, beginning in 1824 and ending in 1866. The total was 4,424,000 acres, divided as follows: Illinois (Illinois River and Lake Michigan), 291,000; Indiana (Wabash and Erie), 1,457,000; Michigan (St.

Mary's Ship Canal, Portage, Superior, La Belle), 1,250,000; Ohio (Miami and Dayton, and General), 1,100,000; Wisconsin (Milwaukee and Rock River and Breakwater), 325,000. The next kind of grants was for river improvements, from 1828 to 1846; and the total was 1,406,000 acres. This was divided as follows: Alabama (Tennessee, Coosa, Cahawba, and Black Warrior), 400,000; Iowa (Des Moines), 322,000; Wisconsin (Fox and Wisconsin), 684,000.

The Pre-emption Act of 1841 was a progressive step, giving a preference to actual settlers, also permitting them to pay for their lands with cash or warrants. According to this act heads of families, widows, or single persons (male or female), over the age of 21 years, who are citizens of the United States, or who have declared their intention to become such, under the naturalization laws, may enter upon any "offered" or "unoffered" lands, belonging to the United States, or any unsurveyed lands to which the Indian title has been extinguished, outside of the limits of any land grant, and purchase not exceeding 160 acres under the pre-emption laws. If the tract is "offered" land, the settler must file his "declaratory statement" in the U. S. District Land Office within 30 days after making settlement; and within one year from the date of settlement he must make proof of actual residence on and cultivation of the land, and thereupon purchase the same at \$1.25 per acre, if outside of the limits of a railroad land-grant, and at \$2.50 per acre if within railroad land-grant limits. If the tract is "unoffered" land, the settler must file his "declaratory statement" within 3 months after the approved plat of the township is received at the U. S. District Land Office, and final proof and payment must be made within 30 months after the expiration of the said 3 months. A pre-emptor may submit proofs of continuous residence at any time after 6 months from the date of settlement and obtain title to his land. The settler in possession of a valid pre-emption claim may, at any time, convert his pre-emption claim into a homestead. No person who abandons his residence upon land of his own (not a town lot) to reside upon public lands in the same State or Territory, or who owns 320 acres of land in any State or Territory, is entitled to the benefit of the pre-emption laws. The Pre-emption Act is now virtually embodied in the 8th section of the Homestead Law to be described below. It is urged that it should be repealed because it is said not to operate uniformly since it does not apply to lands in the Southern States. A very peculiar case arose in regard to actual settlers in what was known as the Territory of Oregon 40 years ago. At that time the territory north of California, indefinitely, was claimed by both England and the United States. In 1846 a treaty designated the parallel 49° N. lat. the boundary between British Columbia and the United States, at which time Oregon contained about 10,000 people. By 1850 the Territory had been organized under the United States, and 3000 more immigrants had arrived. In order to make good titles to land taken up when the sovereignty of the region was doubtful, and also to encourage further immigration, Congress passed what is called the "Donation Law." This perfected titles originating under the previous provisional government, and gave to every actual new settler 320 acres of public land; or, if he were married, it gave him and his wife 640 acres. This law, during its brief existence, aided the settlement of the country so rapidly that the census of only a decade later showed over 50,000 inhabitants.

By far the most important law enacted by the United States was that of 1865, known as the Homestead Act. Under its provisions any person who is the head of a family, or who has arrived at the age of 21 years, and is a citizen of the United States, or has filed his declaration of intention to become such, is entitled to enter one-quarter section, or less quantity, of unappropriated public land. The applicant must make affidavit that he is entitled to the privileges of

the Homestead Act, and that the entry is made for his exclusive use and benefit, and for actual settlement and cultivation, and must pay the legal fee and that part of the commissions required as follows: Fee for 160 acres, \$10; commission, \$4 to \$12; fee for 80 acres, \$5; commission, \$2 to \$6; within 6 months from the date of entry the settler must take up his residence upon the land, and reside thereupon and cultivate the same for 5 years continuously. At the expiration of this period, or within 2 years thereafter, proof of residence and cultivation must be established by four witnesses. The proof of settlement with the certificate of the Register of the Land Office is forwarded to the General Land Office at Washington, from which patent is issued. Final proof cannot be made until the expiration of 5 years from date of entry, and must be made within 7 years. The government recognizes no sale of a homestead claim. A homestead settler may at any time purchase the land under the pre-emption laws if desired, upon making proof of settlement and cultivation for a period of not less than 6 months from the date of entry to the time of purchase. The law allows only one homestead privilege to any one person. A special act covers soldiers' homesteads. Every person who served not less than 90 days in the army or navy of the United States during the War of the Rebellion, and who was honorably discharged and has remained loyal to the government, may enter a homestead, and the time of his service shall be deducted from the period of 5 years, but he or his widow, as the case may be, must reside upon and cultivate his homestead at least one year before final proof can be made, whatever may have been the period of his service. The widow of a soldier, or, if she be dead, or is married again, the minor heirs (if any) may, through their guardian, make a homestead entry, and if the soldier died in the service, the whole term of his enlistment will be deducted from the time otherwise required to perfect the title. Neither the guardian nor the minor children are required to reside on the land, but the land must be cultivated and improved for the period of time during which the father would have been required to reside on the tract. A soldier or sailor as described above may file a homestead declaratory statement for 160 acres of land through an agent, after which he has 6 months within which to make entry of the land and commence his settlement and improvement. This latter entry must be made in person.

It has been proposed that the various homestead acts should be consolidated and that a new law, applicable to all public lands not mineral or timber, should make the entry for lands 160 acres; that a homestead entry should not be considered as consummated until a patent issues; and that the law requiring settlers to advertise their intention to pay for their lands should be abolished. Of course the government expects no revenue from the Homestead Act—the fees and commissions paying only for the cost of survey and the sale. But there is a gain to the nation of more than money value in filing the lands with settlers. The number of acres entered under the Homestead Act for the past 10 years were as follows:

Year.	Acres.	Year.	Acres.
1878.....	4,500,000	1883.....	8,250,000
1879.....	5,250,000	1884.....	7,750,000
1880.....	6,000,000	1885.....	7,500,000
1881.....	5,000,000	1886.....	9,000,000
1882.....	6,350,000	1887.....	7,500,000

There has been a grave abuse of both the pre-emption and the homestead laws. In 1882 and 1884, 7,200 acres of the public lands in Eastern New Mexico were taken up under the homestead and pre-emption laws by one individual for grazing purposes, by entries made in the names of fictitious persons. In the homestead entries, which comprise the greater por-

tion of the cases, pre-emption declaratory statements were filed in the names of the supposititious claimants, alleging a prior residence of more than 5 years required under the homestead laws. These filings were immediately transmuted to homestead entries and alleged proofs at once made, not more than a month or two elapsing from the date the first papers were filed until the final entries were placed on record. In the proofs the alleged residence of the parties was made to relate back and cover the period from 1876 or 1877 to 1882 or 1883. Mexican names were used to represent claimants, and the papers showed on their face that they were all prepared by one individual, the signatures of alleged claimants and witnesses bearing unmistakable evidence that they were written by the same individual and one other person. The lands were conveyed immediately after entry, and the transferee conveyed them to a cattle company. Reliable persons who had lived near the lands from 5 to 15 years, and were well acquainted in the vicinity, testified that they had never seen or heard of any one of the alleged claimants, and that no such persons ever lived on the lands. It is estimated that fully 90 per cent. of all the entries made under the two acts in the Territory of New Mexico have been fraudulent. Much of the abuse comes from large cattle-owners who fenced thousands of acres without the slightest claim; or who made claim without any fencing whatever. The consequence has been that there has been developed a system of land-holdings on a scale not known in any other part of the world. In many instances the holders are aliens who have no interest whatever in supporting U. S. laws or institutions. Some of these individuals and corporations own millions of acres; and many of them hold areas of several hundred thousand acres.

In this connection the State laws in regard to alien ownership may be noted. In 1883 land-ownership was made the subject of special investigations and it was found that citizens and aliens are on the same footing in Alabama, Arkansas, California, Colorado, Dakota, Florida, Georgia, Illinois, Indiana, Iowa, Kansas, Louisiana, Maine, Maryland, Missouri, Massachusetts, Michigan, Minnesota, Mississippi, Nebraska, Nevada, New Hampshire, New Jersey, New Mexico, North Carolina, Ohio, Oregon, Pennsylvania, Rhode Island, South Carolina, Tennessee, Texas, Utah, Vermont, Virginia, West Virginia, Washington Territory, and Wisconsin. California and Utah require simply a non-resident alien to whom an inheritance falls to claim it within 5 years. This is merely a reasonable statute of limitation. Nevada prohibits a subject of China from owning real estate. Pennsylvania limits the right of purchase in an alien to 5000 acres, but he may hold without limit real estate by devise or descent. This is the only State in the Union that limits the amount of land purchasable by law. In Vermont it was stated in the case of *The State vs. Boston, Concord, and Montreal R. R. Co.*, that while no laws prohibit aliens enjoying real estate, and while the power of escheat may still exist, *strictissimi juris*, yet it has always remained dormant, notwithstanding the frequent occasions for its legitimate exercise. In other words, the common law, although unrepealed, is a dead letter in practice. The Indiana statute of 1881 provides that any non-resident alien may acquire by inheritance real estate as though he were a citizen; but the time during which he may hold, sell, alienate, and convey expires in 8 years after final settlement of the decedent's estate from which it was derived. A resident alien is in all respects in the same position as a citizen, and it may generally be remarked that in States in which restrictive laws are in force the resident has superior rights to the non-resident alien. In the under-mentioned States and Territories the following is the state of the law: Connecticut: Aliens residing in the United States and natives of France can hold and transmit land. Other

aliens are restricted to lands for mining and quarrying only. No doubt exists that a treaty negotiated with a foreign power by the President can abrogate restrictive State land laws in regard to aliens, and this curious exception in favor of the French was probably incorporated in the State laws of Connecticut in deference to the U. S. treaty with France during the Revolutionary war. There are two early Anglo-American treaties on the same subject. Delaware and Kentucky draw the line at resident aliens who have declared their intention to become citizens. New York, which has always been the most progressive in law reform, strangely holds to the doubtful blessing of the common law, although many slight modifications have been made by statute. A declaration to become a citizen is still necessary to make a legal devise of lands. Up to 1881 the Territories of Arizona, Idaho, and Montana seem to have enacted no laws upon the subject, but the practice is undoubtedly in conformity with all the Western States in granting the fullest power to the alien. A bill was introduced in the Senate of the United States, in 1884, limiting foreign holdings to 30 square miles of land. This bill was not passed; but it is evident that some restriction of the sort is needed. There can be no doubt that settlement has been retarded in the regions affected by the course of the land-thieves. The only check to the monopoly of the cattle-men in some of the Territories has been the spread of sheep-farming, which prevents range-feeding for cattle. The use of the wire fence, by these corporations, noted above, was found to be so reckless that, in August, 1885, Pres. Cleveland issued the following proclamation: "I do hereby order and direct that any and every unlawful enclosure of the public lands, maintained by any person, association, or corporation, be immediately removed, and I do hereby forbid any person, association, or corporation from preventing or obstructing by means of such enclosures, or by force, threats, or intimidation, any person entitled thereto from peaceably entering upon and establishing a settlement or residence on any part of such public land which is subject to entry and settlement under the laws of the United States; and I command and require each and every officer of the United States upon whom the duty is legally devolved to cause this order to be obeyed and all the provisions of the act of Congress herein mentioned to be faithfully enforced."

The Timber Culture Act of 1878 provides that public lands, naturally devoid of timber, may be acquired by planting trees thereon and keeping the same in a healthy, growing condition for 8 years. Not more than 160 acres in any one section can be entered, and no person can enter more than 160 acres or make more than one entry under these laws. An applicant must be the head of a family, or 21 years of age, and a citizen of the United States, or he must have filed his declaration of intention to become a citizen, as required by the naturalization laws. The Land Office fee for an entry of more than 80 acres is \$14; and for 80 acres or less, \$9; and \$4 when final proof is made. Land to be entered must be entirely devoid of timber. In order to acquire 160 acres of land, 10 acres must be cultivated and planted with trees; 5 acres must be cultivated and planted with trees to acquire any legal subdivision of 80 acres; and 2½ acres to acquire any legal subdivision of 40 acres or less. The person making entry of 160 acres is required to break or plow 5 acres during the first year, and 5 acres during the second year. The 5 acres broken or plowed during the first year must be cultivated to crop, or otherwise, during the second year, and be planted to timber during the third year. The 5 acres broken or plowed during the second year must be cultivated the third year, and planted to timber during the fourth year. For entries of less than 160 acres, a proportionate number of acres must be plowed, planted, cultivated, and planted to trees. These trees must be cultivated and protected

for not less than 8 years; and at the expiration of that period, or within five years thereafter, proof must be made by the claimant and two creditable witnesses, showing that there were at the time of making such proof at least 675 living, thrifty trees on each of the 10 acres required to be planted; also that not less than 2700 trees were planted on each of the 10 acres. Fruit-trees are not considered timber within the meaning of this act. Title cannot be obtained prior to the expiration of 8 years, and final proof must be made within 5 years after the expiration of the said 8 years. While the object of the act was a good one, the act itself has been abused quite as much as the Homestead and Pre-emption Acts. About 10,000,000 acres of agricultural lands have been located under it as a disguise; and it is urged that the act should be repealed, on the ground that the timber is actually necessary for the development of the country, since both mining and settlement are impossible without it. A very grave abuse of the timber laws was reported early in 1888, more particularly from California. This report was based upon investigations made during the two previous years. It was shown that the abuses were committed partially by a group of capitalists who coveted the choice redwood forests of Humboldt county. They engaged a group of timber speculators to get possession of the land and transfer it to them. The speculators hired 600 persons to take 160 acres apiece under the Timber Land Act, each swearing that he applied for the land "in good faith to appropriate it to his own exclusive use and benefit," and that he did not intend to transfer the title to any other person. Records of the county show that the timber alone on the land seized by these companies had an estimated value of \$11,000,000. Since the exposure many entries have been held for cancellation, and proceedings have been instituted to set aside patents issued on many such entries.

What are known as the "Swamp Land Grants" were made under the act of 1854 relating to desert lands. This act provided that any person who is a citizen of the United States, or any person of requisite age who may be entitled to become a citizen, and who has filed his declaration to become such, may file his oath with the Register and Receiver of the Land Office in the district in which any desert land is located, that he intends to reclaim, not exceeding one section of said land, by conducting water upon it, within 3 years; and by paying to the receiver the sum of 25 cents per acre for all the land claimed, such person may enter said land under the act. At any time within 3 years a patent can be obtained by making proof that he has reclaimed said land, and paying the additional sum of \$1 per acre. No person can enter more than one tract of land, and not to exceed 640 acres, which shall be in compact form. This act applies to desert land in Dakota, Montana, Idaho, Washington, and Oregon. Desert lands are defined by this act to be all lands, exclusive of mineral and timber lands, which will not, without irrigation, produce some agricultural crop. Even this law has been the cause of great abuse; because many lands have been claimed which were as fertile as any classed under the other acts for settlement. Nearly 100,000 acres were granted under this act during the year ending June 30, 1888; and the aggregate reaches 57,000,000 acres. The greater part of these grants have been made in the State of Florida; Louisiana, Michigan, and Oregon coming next in order. The original grants were made for the purpose of enabling States to construct levees necessary to reclaim swamp and other lands; but it was required that the proceeds of such lands should be applied to the reclamation of the same. The claims of many States were transferred to counties, and the money realized was used in such counties for roads, bridges, and many other purposes not contemplated by the law. Some of the lands have even been disposed of to railroads. Consequently only a small part of the proceeds has really gone to reclaim the lands. Further acts of 1855 and

1857 provided indemnities in such a way that nearly 600,000 acres of good land have been obtained so that certain agents could draw their percentages. A thorough investigation has, however, been prosecuted by the U. S. Land Office. The United States have also granted lands from time to time to the several States for educational purposes. At the present time (1888) there remain of such lands 1,850,000 acres. The good or bad use of such lands depends upon the people of each State respectively.

The most important and far-reaching grants of the United States have been those to railroads. Until 1850 the development of the Western territory proceeded gradually and steadily, by normal and natural methods of growth. Indiana, Michigan, and Illinois had become prosperous and populous States rapidly, it is true, but not by any speculative or adventitious means. As emigration from the East formed here and there upon the Western prairies, and along the water-courses of the great Mississippi Valley, the comforts and conveniences of the Atlantic States soon followed in its train. Where new railways were needed new railways were built, by private capital, in the ordinary way, just as they had been in the East. But, in 1849, the California gold fever quickened the pulse of the nation to an unnatural degree. All at once a State of the Union loomed up in the far West—as far from New York in one direction as Europe was in the opposite direction—and the country awoke to realization of the vastness of its domain and its glorious possibilities in the way of material wealth. Emigration became a national fever. Everybody who could do so went off to Iowa, Minnesota, Kansas, Nebraska, California, Oregon, and the intermediate Territories. The consequence was that there was soon a great population in those parts; but the inhabitants were widely scattered, and there were few large towns between St. Louis and San Francisco. The several laws allowing grants to railroads began in 1850 and ended in 1874. Nearly all the lands were taken by 1866, and their aggregate now (1888) is about 37,000,000 acres. This has been divided among the several States, in round numbers, by the thousand acres, as follows: Illinois, 2600; Mississippi, 1000; Alabama, 3000; Florida, 1760; Louisiana, 1072; Arkansas, 2517; Missouri, 1400; Minnesota, 8000; Kansas, 4638; Iowa, 4708; Michigan, 3229; Wisconsin, 3400. Between 1863 and 1869 a total of nearly 2,000,000 acres was granted for wagon roads, as follows: Wisconsin, 303,000; Michigan, 221,000; Oregon, 1,260,000. The grants for railroads to the several States were applied toward constructing the following railroads: Illinois—Illinois Central; Mississippi—Mobile and Ohio, Vicksburg and Meridian, Gulf and Ship Island; Alabama—Mobile and Ohio, Alabama and Florida, Selma, Rome, and Dalton, Alabama and Tennessee, Coosa and Tennessee, Mobile and Girard, Alabama and Chattanooga, South and North Alabama; Florida—Atlantic, Gulf, and West India Transit, Florida and Alabama, Pensacola and Georgia, Florida, Atlantic, and Gulf Central; Louisiana—North Louisiana and Texas, New Orleans, Opelousas and Great Western (in 1870, act passed forfeiting all lands not lawfully disposed of by the State); Arkansas—St. Louis, Iron Mountain, and Southern, Little Rock and Fort Smith, Memphis and Little Rock, St. Louis and Iron Mountain of 1866 (which was declared forfeited in 1884); Missouri—South-west Branch of the Pacific, Hannibal and St. Joseph, St. Louis, Iron Mountain, and Southern, St. Louis and Iron Mountain (forfeited); Iowa—Burlington and Missouri River, Chicago, Rock Island, and Pacific, Cedar Rapids and Missouri River, Dubuque and Sioux City, Iowa Falls and Sioux City, Des Moines Valley, McGregor and Missouri River, Chicago, Milwaukee, and St. Paul, Sioux City and St. Paul; Michigan—Port Huron and Lake Michigan, Jackson, Lansing, and Saginaw, Grand Rapids and Indiana, Flint and Pere Marquette, Marquette, Houghton, and Ont-

tonagon, Ontonagon and Brulé River, Bay De Noquet and Marquette, Chicago and North-western; Wisconsin—Chicago, St. Paul, Minneapolis, and Omaha, and formerly West Missouri, and formerly St. Croix and Lake Superior with branch to Bayfield, Wisconsin Railroad Farm Mortgage Land Company, Chicago and North-western, Wisconsin Central; Minnesota—St. Paul, Minneapolis, and Manitoba, St. Paul and Pacific, Brainerd Branch, St. Vincent extension, Minnesota Central, Winona and St. Peter, St. Paul and Sioux City, St. Paul and Duluth, Southern Minnesota and extension, Hastings and Dakota; Kansas—Leavenworth, Lawrence, and Galveston, Missouri, Kansas and Texas, Atchison, Topeka, and Santa Fé, St. Joseph and Denver City, Missouri River, Fort Scott, and Gulf. Corporations—Union Pacific, Central Pacific, Western Pacific, Central Branch Union Pacific, Kansas Division of Union Pacific, Burlington and Missouri River in Nebraska, Sioux City and Pacific, Northern Pacific, Placerville and Sacramento Valley of 1866 (declared forfeited in 1884), Oregon Branch of Central Pacific, Oregon and California, Atlantic and Pacific, Southern Pacific and Branch Line, Stockton and Copperopolis of 1867 (declared forfeited in 1874), Oregon Central of 1870 (declared forfeited, as to parts, in 1885), Texas Pacific of 1871 (declared forfeited in 1886), New Orleans Pacific (formerly New Orleans), Baton Rouge, and Vicksburg of 1871 (declared forfeited in small part and confirmed in large part in 1887). Of the grants to corporations the certified acres were as follows, in thousands: Central Pacific, 963; Central Pacific (successor to Western Pacific), 443; Central Pacific, Oregon Branch, 1362; Union Pacific, 2616; Union Pacific, central branch, 218; Union Pacific, Kansas division, 964; Union Pacific, successor to Denver Pacific, 165; Burlington and Missouri River, in Nebraska, 2373; Sioux City and Pacific, 41; Northern Pacific, 746; Oregon and California, 322; Atlantic and Pacific, 959; Southern Pacific, 1040; Southern Pacific, branch line, 188; New Orleans Pacific, 679; total, 13,085,000 acres.

These land grants had always been given with the condition attached that the roads must be constructed, finished, and put into operation before a certain specified time, failing which the grant would be inoperative. No attention, however, was paid to this part of the matter for many years. Grants were made to one road after another in quick succession, and the time had not yet arrived for inquiry as to how the beneficiaries were fulfilling their side of the contract. Then came the civil war, which concentrated all the care and energy of the nation to the exclusion of all minor matters; and it was not until long after the war that the government bethought itself of the interest it had in these Western roads. The Forty-seventh Congress, which began in 1881, was the first Congress to consider the question of forfeiture. The question arose in this way: Some settlers who had established homesteads in the upper peninsula of Michigan were suddenly confronted by the agents of a railway company who claimed their lands under the provisions of an old land grant, the terms of which had never been complied with by the company. The lands had belonged to the company at one time by the language of the grant, but the road had not been built, and the term of years in which it was ordered to be built had expired. The settlers took the matter to the courts, including the Supreme Court, but the decision was against them. In despair they turned to Congress for relief, and their petition was referred to the House Judiciary Committee. Nothing was done by this Congress; but the Forty-eighth Congress, in 1884, took up the matter and passed a resolution that all railroad land grants which have not been earned by the fulfilment of the conditions specified in the respective acts ought to be declared forfeited and restored to the public domain; and that the whole system of land laws now existing ought to be overhauled, and so changed as to open the

agricultural portions to actual settlers only, and to prevent grabs of public lands of any kind, whether farming, mineral, or forest. The question continued to be agitated with good results. The land department of the Central Pacific Railroad Company decided to sell no land to any person who would not keep and improve it, making a large reduction, however, to such persons. The railroad also proposed to retain control of the land until it had been improved in the manner agreed upon, and reserved the right to prevent a sale to speculators. Congress, on the 3d of March, 1887, passed a law providing that the Secretary of the Interior shall immediately adjust, in accordance with the decisions of the Supreme Court, each of the railroad land grants made by Congress to aid in the construction of railroads, and heretofore unadjusted. In October of the same year the Commissioner of the Land Office decided that an actual settler on restored railroad lands, who holds a deed from the railroad company, can secure title from the government under the pre-emption or homestead laws, provided he has not exhausted his privilege thereunder. The 5th section of the act of March 3, 1887 (24th *Statutes*, 5006), provides that when lands within the limits of railroad grants coterminous with the constructed portions of the lines of roads, which lines have not been conveyed on account of the grants, but were excepted from the operations of the same, and which have been sold by the railroad company to citizens, or to persons who have declared their intentions to become citizens of the United States, such lands at the date of purchase from the railroad company not being in the bona-fide occupation of adverse claimants under the pre-emption or homestead laws of the United States, and where claims and occupations have been voluntarily abandoned, and where such lands are not of the class described as settled upon subsequent to the 1st day of December, 1882, by persons claiming to enter the same under the settlement laws of the United States, then bona-fide purchasers from the railroad company, if qualified as to citizenship, their heirs or assigns, may make payment to the United States for such lands at the ordinary government price for like lands, and receive patents therefor.

As the result of the agitation relating to forfeitures it is now stated that the adjustment of the grant to one wagon-road and 32 railroads has been completed. This adjustment discloses the fact that 7 railroads and one wagon-road have had land certified or patented to them in excess of their respective grants to the amount of 218,590 acres, and suits are recommended, under said act, to vacate such illegal patents or certificates. There are 2000 forfeiture cases pending in the U. S. Land Office, and lands in the indemnity limits of the Northern Pacific, the Atlantic and Pacific, the Southern Pacific, the California and Oregon, and the Oregon and California roads, to the extent of 17,830,000 acres, are affected by these cases. Of the 25,429,866 acres of land covered by selections pending at the close of the fiscal year, 1888, 21,660,486 acres were selected by railroad companies whose roads were not completed in the time required by their respective grants. It has been recommended that there should be forfeiture of all lands coterminous with those parts of the respective roads which were uncompleted at the expiration of the limited time for their construction.

The future of the country depends largely upon the settlers that will occupy the unoccupied public lands. Upon the ownership of these lands by small holders rests the security of the country from internal disturbances. It is stated that in England only 1 person in 20 is an owner of land; in Scotland, 1 in 25; in Ireland, 1 in 79; and that the great majority of landholders in Great Britain own less than one acre each. From past experience it is not likely that any such record as this can ever be made in regard to the public lands of the United States. But it would seem that the laws should be so amended that the same settler

cannot take 130 acres under the Homestead Act; 130 acres under the Pre-emption Act; 640 acres under the Desert Land Act; and 160 acres under the Timber Culture Act—a total of 1060 acres. (F. G. M.)

PUEBLOS, an interesting family of Indians of New Mexico and Arizona, agricultural in their habits, and dwelling in very large, single habitations, sometimes capacious enough to contain a whole tribe. They are also known as Village Indians, village being the English rendering of the Spanish *pueblo*. The remarkable edifices built by these semi-civilized tribes are in some cases constructed of stone laid in mud mortar, but more generally of adobe or sun-dried brick. They cover a considerable area and are several stories high, sometimes 5 or 6. They are in some cases built in the form of a hollow square; in others on the brow of a high bluff or mountain terrace of difficult approach. Defence against enemies seems, indeed, an essential feature in their construction, and the lower story is invariably without doors or windows, the only entrance to the house being attained by ladders leading to the second story. Each story recedes a few feet from the line of that below it, leaving a terrace, which extends round the whole structure, to which this successive decrease in area of the stories gives something of a pyramidal aspect. There are no stairways anywhere in the edifice, all access to higher stories being attained by ladders. In some of these extensive edifices whole communities, numbering from 300 to 700 souls, reside, each family having a single apartment. Should this become overcrowded by increase of the family another apartment is occupied, or if there be none vacant, a new one is built above, thus adding to the height of the building. In each edifice there are reserved one or more large rooms capable of holding several hundred persons. These form the council-chambers of the tribe, and are also used for the tribal dances, of which there are several kinds, apparently connected with religious rites.

There are 19 of these villages in New Mexico, most of which have been occupied for a very long period, their inhabitants obtaining a livelihood by the cultivation of the soil, in which they have considerable skill. Their occupants number over 8000 souls and possess about 900,000 acres of land, but only 100,000 are tillable. On these they raise maize, wheat, vegetables, fruit, and cotton, while they possess considerable herds of horses, cattle, mules, goats, and sheep. The rainless character of the region renders irrigation necessary, and they have a well-devised system of ditches, many of which have been in use for centuries. They are economical in their habits and hard workers, each head of a family having a farm of his own, not well cultivated according to our ideas, yet sufficiently so to provide the necessities of life. As a people they are quiet, honest, and law-abiding, take good care of the farming implements with which the government has provided them, and are making slow but steady progress in education and civilization. In addition to agriculture they possess certain simple industrial arts, spinning and weaving cotton and wool into fabrics for clothing and heavy blankets, while they have some skill in the manufacture of pottery, which they ornament with various designs in color and geometrical figures. Their warlike habits are of a barbarous character, approaching those of the Aztecs. It is said that when an enemy is killed in battle they cut off his scalp, drink his blood, and bathe their faces and garments in it. Then they wet their hands in it, believing it will increase their strength and courage. The scalp of an enemy is placed in the hands of him who first took it, even if he was not present at the killing, and he is afterwards regarded with distinction, as if he had performed some great deed of valor. It can, fortunately, be said that all this refers to their former customs, as they have no opportunity or incitement under present conditions to indulge in hostilities.

In addition to the New Mexican tribes there are a

number of related agricultural tribes in Arizona some of which differ in their building habits from the former, yet are connected with them in other particulars. The Moquis tribes, numbering about 2200 and speaking languages of a different family, erect buildings like those described, these being placed on the summit of high mesas or isolated hills, which rise abruptly from the plain to the height of from 300 to 500 feet, and are so steep as to be almost inaccessible to an enemy. There are seven of these villages in the Arizona agency, only two of which are accessible by a wagon-road. Of these that known as Oribi is much the largest. The houses are all of stone, many of them 3 or 4 stories high, with flat, dirt roofs, cement floors, and small windows and doors. Lumber is such a luxury that it is seldom used even for doors. The furniture is very simple, a sheepskin serving for chair, the floor for table, while a few baskets, blankets, and pieces of pottery constitute the whole of the household goods. Nearly every family has a corn-mill, in which the grain is ground to flour by hand, rubbing with a stone. The Moquis are pastoral and agricultural in their habits. Nearly all have a few sheep, and some have large flocks of sheep, besides horses and barros. They all cultivate the soil, the farms of some being 15 miles or more from the village, their field-crops being wheat and corn, onions, beans, and melons their favorite vegetables, while peaches, apricots, and other fruits are raised. They weave their own belts and blankets and a coarse kind of cloth, and have some skill in the making of pottery.

The Pima Indians of the lower Colorado region are apparently of the same stock and cultivate the ground, but are of a lower grade of civilization. Their dwellings are the ordinary wigwam of the northern Indians, rudely built, with a hole on one side, through which the savage crawls into his home. They have no chimney or other means of ventilation, and are too low to allow him to stand erect, while the smoke is generally thick enough to stifle a white man. These are their winter habitations; in summer they live in the fields under a shelter made of forked sticks, covered with brush and poles to protect them from the sun. There are some 4000 in all of these and the related Mariposa tribes.

The Pueblo Indians have been known for over three centuries, their habits when first known being the same as those displayed now, and many of their habitations the same. They were first visited by Alvar Nuñez during his remarkable journey from Florida to the Pacific between 1529 and 1538; afterwards by De Niza in 1539, and in 1540 by Coronado, who visited and described the villages in much the same language as would now be applied to them. The "City of Cibola," called by others Zuñi, visited by him, is still in existence, and inhabited by one of the most interesting of the Pueblo tribes. Of the earlier history of these Indians nothing is known. They have a few vague traditions, but nothing definite; yet the ruins of old pueblos and the remains of ancient pottery, which are found not only near these ruins but generally over the plains, indicate a high antiquity and a much more numerous population than at present. In the Valley of the Gila, thirty miles above the Pimo villages, are traces of ancient canals, adobe buildings, and pottery of a superior character. The same is the case in other parts of northern Arizona, there being evidences of extensive irrigating works and a large population, while numerous remains are found in New Mexico, some of them more extensive and exhibiting a higher type of art than in the present villages. Mr. Bandler, who examined these ruins and studied the Indian habits under the direction of the American Institute of Archaeology, has determined that the area formerly occupied by the Pueblo Indians is bounded on the east by a region 40 miles west of the Pecos River, New Mexico, and extends west to within about 100 miles of the Colorado. Northward it reaches to nearly

the 40th parallel of latitude, while the limit of southward extension is not well indicated. The pueblos vary in degree of skill, and indicate a gradual development from the Indian lodge to the complex edifices. He doubts the assertions sometimes made about a former large population, and thinks that the many buildings indicated by the ruins were occupied successively, and not simultaneously. This seems confirmed by the traditions of the Zuñis and the Pimos.

There are certain reasons to believe that village life was in decadence at the period of the first discovery of these remarkable habitations, and it seems probable that the industrious Pueblo tribes, after developing a primitive agriculture by means of irrigation of the soil of this rainless region, and growing numerous and powerful, were driven south by the hostile tribes of the nomadic Indians of the north, the strange cliff-dwellings of the river cañons of Colorado being defensive points occupied in their gradual retreat. Whether agriculture was original with them, or was derived from the civilized peoples of lower Mexico, cannot well be ascertained. All that can be said is that there seems no linguistic connection with the Aztec or other Mexican nations.

The process of civilizing these Indians has gone on ever since their first discovery. Catholic missions were established among them two centuries ago, and many of them are Roman Catholics to-day, though their Christianity is deeply diluted with paganism, and they still cling to their old beliefs and practices. Among these is the maintenance of the sacred fire and the worship of Montezuma, a deity not to be confounded with the emperor of the Aztecs. The Pueblo Indians were the citizens of Mexico, and came into the United States with the rights thus acquired. They thus maintain a different relation to the government from any other Indians, and hold their lands in fee under government patents. The treaty with Mexico, as interpreted by Chief-Justice Slough in 1857, makes them full citizens of the United States, but they have not as yet been recognized as such either by the Federal or the territorial authorities. The internal administration of the tribes remains in their own hands, and is conducted in accordance with their old customs, each village being controlled by a governor and a council of three elders.

Under American control the Pueblo Indians are making promising and substantial progress in civilization and education, and will undoubtedly become very useful citizens in the near future, being self-sustaining, peaceful, and law-abiding. Large numbers of their children are at school, and compulsory education is practised with good results. Seven day-schools and two boarding-schools are conducted by the Catholic Board of Missions, and four day-schools and one boarding-school by the Presbyterian Board. There is also a government school. The total average attendance is 680. In some of the schools the boys are taught trades, the girls instructed in housework, while in the communities at large wagon-roads have been made, bridges constructed, fields enlarged, irrigation ditches improved and lengthened, better clothing is worn, more fruit-trees planted, and many other indications of growth in ideas and prosperity are shown. This progress is due to the persistent efforts of the reservation agents, who are working vigorously and intelligently for the advancement of their wards. Among the wigwam-dwelling Pimos many have been induced to build adobe houses by presents of wagons and harness, and some of them now possess comfortable and well-constructed farm-houses furnished with tables, chairs, beds, and other civilized appliances, their walls even being adorned with pictures. When we reflect that these Indians have been under the control of the United States for only forty years, this degree of advancement is certainly very encouraging and is full of promise for their future progress in civilization.

(C. M.)

PULASKI, CASIMIR (1747-1779), a Polish Count who fought and fell in the American Revolution, was born in Lithuania, March 4, 1747. His father, Count Joseph Pulaski, organized the confederation of Bar in 1768, and fell in the revolt against King Stanislaus Augustus. Casimir had served in the army of Duke Charles of Courland, and took an active part in the war in defence of Polish liberty against Russian dictation. After the storming of Bar he sought refuge in a monastery, where he was besieged for some weeks and then permitted to depart, on promise to endeavor to effect a reconciliation. This promise he afterwards repudiated as extorted by force. From Moldavia he carried on a restless warfare and in 1771 he even seized the king at Warsaw, but was compelled to release him. Austria and Prussia united with Russia and effected the partition of Poland in 1772. Pulaski's father and two brothers had fallen in the strife; his property was confiscated, and he was sentenced to outlawry and death. After some service in the Turkish army he went to France, where he lived in poverty and obscurity. In 1777 he was brought to the notice of Franklin, who engaged his services in behalf of American independence. Soon after his arrival at Philadelphia, Pulaski's bravery was conspicuous at Brandywine and Germantown, and he was made a brigadier of cavalry. In March, 1778, he joined the main army at Valley Forge and was authorized to organize an independent corps of lancers and light infantry. He visited Bethlehem in the spring, and seems to have had one or more small flags embroidered there by the Moravian Sisters. But the consecration of Pulaski's banner, as described in Longfellow's poem, has no foundation in fact. In six months the Count had raised a legion of 330 men, chiefly in Maryland, and then joined Washington's army in New Jersey. While marching to Little Egg Harbor he was betrayed by a deserter, and surprised by the British, and 40 of his men were killed. In February, 1779, he went to the South to assist in the defence of Charleston. Reaching that city in May, he made a bold assault on the British but was repulsed. Charleston was relieved soon after, and the French Count d'Estaing called the Americans to besiege Savannah. Here an assault was ordered on Oct. 9, and Pulaski, at the head of the cavalry, received a mortal wound. He died on board the brig *Wasp*, Oct. 11, 1779, and was buried at St. Helen's Island. In 1825 Lafayette laid at Savannah the corner-stone of a monument, erected by the people of Georgia. A flag or banner of Pulaski, 20 inches square, is in possession of the Maryland Historical Society at Baltimore. Jared Sparks wrote the *Life of Count Pulaski* (1845) in his *American Biography*.

PULSZKY VON LUBOCZ UND CSELEVA, **FRANZ AUREL**, Hungarian statesman and author, was born at Eperies, Sept. 17, 1814. After completing his education he spent some time in foreign travel, and his *Diary of a Journey in Great Britain* (1837) procured his admission to the Hungarian Academy. He was elected to the Reichstag in 1839. In 1848 he was secretary of the Hungarian Finance Ministry, and later held a similar position in Vienna. Toward the end of that year he took part in the Hungarian revolution and after its failure accompanied Kossuth in his journey through the United States. Pulszky described this country in his *White, Red and Black* (3 vols., 1853). Having in the meantime been condemned to death by a court-martial in Hungary, he took up his residence in England. In 1860 he went to Italy, and took part in Garibaldi's expedition, which ended at Aspromonte, and was for a time a prisoner at Naples. In 1866, when constitutional self-government was granted to Hungary, Pulszky shared in the amnesty and returned to his native land. He was a member of the Reichstag from 1867 to 1875, and attached himself to Deak. In 1869 he was made director of the National Museum, and in 1872 super-

intendent of the public museums and libraries. Since 1884 he has again been a member of the Reichstag. His later works have been his autobiography, *My Life and Times* (4 vols., 1882), and *The Bronze Age in Hungary* (1884).

His wife, **THERESE PULSZKY** (1819-1866), was married in 1845, and after her husband settled in England engaged in literary work. Her principal publications were *Memoirs of a Hungarian Lady* (2 vols., 1850), and *Tales and Traditions of Hungary* (2 vols., 1851).

PUMPELLY, RAPHAEL, geologist, was born at Owego, N. Y., Sept. 8, 1837. He received his scientific training at Paris, Hanover, and Freiberg, Saxony, and returning to the United States in 1860 engaged in mining in Arizona. In 1861 he was employed by the government of Japan in exploring the mineral resources of the island of Yezo and in 1863 by the government of China in surveying the coal-fields of that empire. In 1866 he was made professor of mining engineering in Harvard University. In 1870 he surveyed the copper region of Michigan, and in 1871-73 was State geologist of Missouri, and published *Reports* of his work. When the U. S. Geological Survey was organized, Prof. Pumpelly took charge of the division of economic geology. He was a special agent of the Tenth Census and for its *Report* prepared Vol. XV., on *Mining Industries*. From 1881 to 1884 he was engaged in the Northern transcontinental survey, which he organized. Since 1884 he has been geologist of the archæan division of the national geological survey. Besides *Reports* of his public work and contributions to scientific journals he has published *Geological Researches in China and Japan* (1866), and *Across America and the Andes* (1869).

PUMPKIN, an annual plant of the *Cucurbitaceæ*, or gourd family, genus *Cucurbita*. Plants of this genus bear large yellow flowers with a bell-shaped corolla, 5-cleft, its base adherent to the calyx tube, with 3 long much curved anthers which unite into a small head, and 3 stigmas. The fruit is fleshy with a firm rind. The pumpkin, *C. pepo*, bears a fruit often of enormous dimensions, and is largely cultivated both in Europe and America, the fruit being fed to cattle and used in domestic cookery. The term pumpkin, a corruption of pompon, is very loosely applied in this country. In some sections it is used to include the squashes, members of another species; in others it embraces only the few varieties of the common New England pumpkin. The latter is a vigorous, prostrate plant, running 12 feet or more, with a hairy, almost prickly stem, the fruit being nearly round or elongated, of large size, the outer surface ribbed or furrowed, the internal portion mellow and crossed by pulpy threads. The average size of the fruit is about one foot diameter, though it is often much larger, its color a clear orange-yellow. As ordinarily grown, the seeds are planted in fields of corn or potatoes, and the plant left to take care of itself; yet, even with this neglectful agriculture, it often yields as much as a ton of the fruit per acre without apparent detriment to the yield of corn or potatoes from the same field.

The native country of the pumpkin is disputed, but there is good reason to believe that it is indigenous to America. The common field-pumpkin was much used for food in New England before the introduction of improved varieties, or of the more edible squashes, being made into pies, cooked as squashes are now cooked, or baked, the seeds and stringy matter having been removed. For winter use it was cut into strips and dried in the sun or in a warm room. At present it is mainly used to feed farm-animals, which eat it with avidity, though the seeds, being diuretic in their action, need to be first removed. This variety is of a rich orange-yellow color, and round shape with flattened ends, averaging about 14 inches long by 11 or 12 inches wide. The flesh is yellow, generally coarse-grained, and often stringy, yet still esteemed by many above the

improved varieties for making the favorite pumpkin pie of New England.

Of the varieties the Canada or Vermont pumpkin is one of the best for animal food, and of good quality for the table. It is of large size, oblate form with deep ribs, and a deep orange-yellow color. The flesh is much sweeter and less stringy than the common pumpkin. The cheese pumpkin is a remarkably vigorous and productive plant, the fruit large, much flattened, and deeply ribbed, its color a reddish-orange. The flesh is sweet and well flavored. There are several other

Sugar Pumpkin.

varieties, the best of which for culinary purposes is the sugar pumpkin. This is of small size, being 8 or 9 inches broad and 6 deep, but is an abundant bearer and of excellent quality, being unsurpassed for pies and superior to many squashes for table use. The flesh of the pumpkin contains much sugar, and during the Revolutionary war it was boiled and the water evaporated to syrup by housewives, as a substitute for sugar. In addition to the diuretic action of pumpkin seeds, they are employed as an anthelmintic for the removal of tapeworm. (C. M.)

PURCELL, JOHN BAPTIST (1800-1883), Roman Catholic archbishop, was born at Mallow, Ireland, Feb. 26, 1800. He had received an academical education before he removed to the United States. Here he studied at Mount St. Mary's College, Emmitsburg, Md., supporting himself partly by gardening. After theological study at St. Sulpice he was ordained priest in the church of Notre Dame, Paris, May 21, 1826. Returning to Mount St. Mary's, he was appointed professor of moral philosophy and pastor of its congregation, and in 1829 became president. On May 19, 1833, he was appointed bishop of Cincinnati, and was consecrated in Baltimore cathedral October 13. He devoted himself with energy to the building and founding in all the growing cities of Ohio churches, orphan asylums, ecclesiastical seminaries, convents, and religious houses. In the city and suburbs of Cincinnati he founded 30 churches. He was also active in debates with religious leaders, the most noted of whom was Alexander Campbell (*q. v.*). In 1850 his diligence was rewarded by his promotion to the dignity of archbishop. He was loyal to the cause of the Union throughout the civil war. He attended the Vatican Council in 1870, and though he deprecated the promulgation of the Papal infallibility, he cordially embraced the dogma. For a few years longer his career continued to be one of success and prosperity in his work. But a great change came when it was discovered that the financial affairs of his see had been grossly and recklessly mismanaged. Trusted implicitly by thousands of Catholics, he had used the sums deposited with him in the buildings and support of ecclesiastical institutions, paying interest when asked, but making no proper provision for the return of the principal. His brother, Rev. Edward Purcell, whom he had called to assist him in his banking operations, had been

equally careless. In the financial distress which followed the crisis of 1873 the archbishop was unable to meet the numerous demands of his creditors. In December, 1878, he made a public assignment of his property for their benefit, endeavoring at the same time to retain for the church the use of many buildings. Much litigation ensued, and the civil courts in an equitable spirit examined the circumstances of the grants to churches. The claims proved amounted to \$3,672,371; large sums were lost by the ignorance of the depositors. Even after the bankruptcy the assignee also was found to have squandered part of the funds in speculation. Archbishop Purcell had retired from public view, and was succeeded by Archbishop Elder, of Natchez. He died at St. Martins, Ohio, July 4, 1883.

PUTNAM, FREDERICK WARD, naturalist and anthropologist, was born at Salem, Mass., April 16, 1839. His early fondness for natural history led him to become a student under Agassiz, who soon gave him charge of the collection of fishes in Harvard Museum of Comparative Zoölogy. In 1864 he took charge of the collections of the Essex Institute, at Salem, to which were afterwards added those of the East India Marine Society. In 1876 he became director of the Peabody Museum of American Archaeology and Ethnology. He had already edited vol. vii. of the *Report of Wheeler's Survey*, which treats of these subjects. Since 1873 he has been secretary of the American Association for the Advancement of Science, and has labored with great success to increase the number of its members and the value of its work. In 1886 he was made professor of ethnology in Harvard University. He was one of the founders of the *American Naturalist* in 1867, and one of its editors till 1875. He has also taught in Prof. Alexander Agassiz's summer school on Penikese Island, State commissioner of Massachusetts on inland fish, and in 1887 was chosen president of the Boston Society of Natural History. He has published more than 200 papers on American archaeology and anthropology. In 1888 he conducted successfully a movement for the purchase and preservation of the Great Serpent Mound in Ohio as a public park.

PUTNAM, ISRAEL (1718-1790), general, was born in that part of Salem now called Danvers, Mass., Jan. 7, 1718. His parents had twelve children, of whom he was the eleventh. With little education but of sturdy frame he in 1739 became a farmer at Pomfret, Conn. Already noted for courage, he enhanced his reputation by venturing into a she-wolf's den and killing the beast. In 1755 he was made a lieutenant of rangers and served in the expedition against Crown Point. In 1757 his coolness and courage prevented the explosion of the powder-magazine during a fire at Fort Edward. Romantic adventures with Indians marked his career. In 1758 they captured and bound him to a tree, and a fire was kindled around, when Marin, a French officer, intervened and saved him. Taken to Montreal, he received aid from Col. Peter Schuyler, a fellow-captive, and was finally exchanged. In 1762 he commanded a regiment in the expedition which captured Havana. He afterwards kept a tavern at Brooklyn, Conn., served some years in the Legislature, and in 1773 went to explore a tract of land on the Southern Mississippi supposed to have been granted by Parliament to the provincial officers. He was an ardent patriot, and in April, 1775, on learning of the fight at Lexington, he summoned the militia of his neighborhood and rode in one day 68 miles to Boston. The Legislature of Connecticut made him a brigadier-general, and with a regiment recruited by himself he joined the American army at Cambridge. This place he was resolute in holding, and when others advised falling back he urged an advance. After Col. Prescott had made intrenchments on Breed's Hill, Gen. Putnam sought to do the same at Bunker's Hill, and at the close of the battle, June 17, rallied some fugitives and took possession of Prospect Hill. Four major-gen-

erals were nominated by Congress for the Continental army, but Putnam was the only one to whom Washington on taking the chief command delivered the commission. After the evacuation of Boston Putnam went with Washington to the defence of New York city. He was to blame for the defeat suffered on Long Island, Aug. 27, 1776. In the winter he was called by Congress to superintend the fortification of Philadelphia, and after the battle of Princeton was stationed in New Jersey. In spring he took charge of the highlands of the Hudson, his chief duty being to watch the movements of the British from New York city. The capture of a lieutenant of a Tory regiment and Sir Henry Clinton's demand for his treatment as a British officer led to Putnam's famous letter:

"SIR:—Edmund Palmer, an officer in the enemy's service, was taken as a spy lurking within our lines; he has been tried as a spy, condemned as a spy, and shall be executed as a spy, and the flag is ordered to depart immediately. ISRAEL PUTNAM.

"P. S.—He has been accordingly executed."

After the loss of Forts Montgomery and Clinton in October, 1777, a court of inquiry was ordered and, though Putnam was declared free of blame, Washington, in deference to popular feeling, removed him from the command. He was stationed in Connecticut when Gov. Tryon, with 1500 men, made a raid into the State. Putnam with but 150 men faced him at Horseneck, and when obliged to retreat ordered his men to take refuge in a swamp, while he on horseback rushed down a steep declivity where the enemy's dragoons would not venture to follow. He afterwards harassed Tryon's retreat. In 1779 he returned to command in the Hudson Highlands and assisted in fortifying West Point, whose importance as a stronghold he had previously pointed out. In the following winter he was disabled by paralysis, and thenceforth remained on his farm, where he died May 19, 1790. His tombstone bears the inscription, "He dared to lead where any dared to follow." His *Life* was written by Gen. D. Humphreys (1790), by O. W. B. Peabody in Sparks's *American Biography* (1842), and by Increase N. Tarbox (1876).

PUTNAM, RUFUS (1738–1824), general, cousin of Israel Putnam, was born at Sutton, Mass., April 9, 1738. He became a millwright, but served as a soldier in the campaigns against the French in 1757–60. On settling at New Braintree, Mass., he became proficient in surveying. In 1773 he took part in the expedition under Gen. Lyman to examine lands on the Southern Mississippi, supposed to have been granted to soldiers who served in the French war. On the outbreak of the Revolution he was lieutenant-colonel and displayed such ability in constructing defences at Roxbury that he won the esteem of Washington. In 1776 he was chief engineer of the defences of New York city, but, though Congress gave him that appointment with rank of colonel, he resigned to take command of a Massachusetts regiment. He fought at the battle of Stillwater and in 1778 with his cousin superintended the fortifying of West Point. At the close of the war he was made a brigadier-general. He assisted in quelling Shays's rebellion in 1787. Being made superintendent of the Ohio Land Company which he had been active in forming, he laid out Marietta, Ohio, in 1788. He was appointed a judge of the North-west Territory in 1790, and in 1796 U. S. surveyor-general. In Gen. Wayne's expedition against the Indians of Ohio Putnam was a brigadier-general and afterwards a commissioner to make a treaty with the tribes on the Wabash, which was done at Vincennes, Sept. 27, 1792. In 1803 Pres. Jefferson removed him from office. After serving in the Ohio Constitutional Convention in that year he held no public position. He died at Marietta, May 4, 1824.

PUTTKAMER, ROBERT VICTOR VON, a Prussian statesman, was born May 5, 1828, at Frankfort-on-the-Oder, his father afterwards becoming president of the

province of Posen. He attended the gymnasium of his native city and the real-gymnasium of Berlin. In 1846 he entered the University of Berlin and afterwards those of Heidelberg and Geneva, studying jurisprudence, political economy, modern languages, and history. After passing his first examination in the court of appeals at Marienwerder in 1850, he practised as auscultator in the court at Dantzig; in 1851 he became court-referendary; in 1852 government referendary, and, after two years in this capacity in the administration of Posen, he rose, in 1854, to the post of government assessor. In the same year he was called to serve as assistant-adviser in the railroad department of the ministry of commerce. Here he was employed four years under the under-secretary of State Von Pommer Esche, whom, in January, 1859, he accompanied, as adviser-in-chief, to Coblenz. In 1860 he was appointed councillor of the district of Demmin and, during the war of 1866, he was civil commissioner of Moravia. On the conclusion of peace he entered, as assistant-minister, the department of the interior; thereafter he became consulting council in the newly founded bund-chancery. In 1871 he became government-president of Gumbinnen; in 1875 district-president of Lorraine; in 1877 chief president of Silesia. On the retirement of Minister Falk, in 1879, he undertook the office of minister of instruction with the purpose of furthering the negotiations between Pope Leo XIII. and the Prussian government for the promotion of peace between church and state. With this view he succeeded in passing a measure through the diet which empowered the ministry to set aside certain provisions of the "May laws." By his ordinance, dated Jan. 21, 1880, a reformed mode of spelling (called "Puttkamer's orthography") was introduced into Prussian schools. On June 18, 1881, he undertook the ministry of the interior, and, in October, was elevated to be vice-president of the Prussian state-ministry.

His cousin and brother-in-law, MAXIMILIAN VON PUTTKAMER, born in 1831, at Gross-Rossin in Pomerania, after studying law in Bonn and Berlin, passed through various offices, till, in 1879, he was named, as chief of the administration of justice, a member of the newly appointed ministry of Alsace-Lorraine. He began his parliamentary career as a member of the North-German constituent assembly in 1867, and belonged to the National-liberal party, but afterwards withdrew from it on the protective tariff question. In 1881 he was defeated as a candidate for re-election to the imperial parliament, but in the next year the entire administration of prisons and instruction, except public schools, was intrusted to him.

PYNCHON, WILLIAM (1590–1662), a settler of Massachusetts, was born at Springfield, Essex, England, in 1590. He was of ancient family and well educated. In the charter of the colony of Massachusetts Bay, granted by Charles I., March 28, 1628, he is named as one of the patentees and also as one of the assistants in governing the colony. In company with Gov. John Winthrop in 1630 he came to America and was one of the first settlers of Roxbury. Being wealthy, he engaged in the fur-trade with the Indians, and was made treasurer of the colony. In a few years many of the settlers desired to remove to the Connecticut River and Pynchon led a colony in 1636 to Springfield. The land was purchased from the Indians and he was made chief magistrate and so continued till 1651, being also for most of the time a member of the General Court. The change was occasioned by the publication of his book, *The Meritorious Price of Our Redemption* (London, 1650), in which he maintained that Christ did not suffer the punishment due to man's sins but by his perfect obedience procured man's redemption. The General Court pronounced the book heretical and called upon Rev. John Norton, of Ipswich, to answer it, which he did to their satisfaction. Meanwhile Pynchon had stated to the court that his views were somewhat modified after conference with Norton.

However being removed from the government and cited again to appear before the court, he left the colony in 1652 and fixed his residence at Wraybury, England. In 1655 his rejoinder to Norton appeared under the title, *The Meritorious Price of Man's Redemption*. In this he admits that the sufferings of Christ were appointed as a punishment for man's sins, but denies that Christ suffered the vindictive wrath of God or the pains of hell. Pynchon's other publications were *The Jews' Synagogue* (1652); *The Time when the First Sabbath was Ordained* (1654); *Holy Time; or the True Limits of the Lord's Day* (1654); *The Covenant of Nature made with Adam Described* (1661). He died at Wraybury, Oct. 9, 1662. But three copies of his first book are known to be in existence; one was sold at the Brinley sale for \$400. See Rev. Ezra H. Binyon's article on "William Pynchon" in the *Andover Review*, September, 1886.

His son, JOHN PYNCHON (1627-1703), succeeded to the management of affairs in the Connecticut Valley. He was for fifty years a magistrate of Springfield and was colonel of the Hampshire regiment. He was an "assistant" under the old charter of Massachusetts and a councillor under the new charter.

PYNCHON, THOMAS RUGGLES, clergyman and educator, is descended in the seventh generation from the preceding. He was born at New Haven, Jan. 19, 1823, and was educated at the Boston Latin School. He graduated at Trinity College, Hartford, in 1841, and was tutor there 1843-47. He took orders in the Protestant Episcopal Church in 1848 and was rector of Stockbridge and Lenox, Mass., until 1855, when he returned to Trinity College as professor of chemistry. He was made president of the college in 1874. He has published an *Introduction to Chemical Physics* (1872), and several sermons and pamphlets.

Q.

QUAIL. See PARTRIDGE.

QUAIN, RICHARD (1816-1887), physician, was born at Mallow, Ireland, Oct. 13, 1816. His early education was in the diocesan school of Cloyne, and he was articled to a surgeon-apothecary in Limerick. In 1837 he went to London and entered the London University, whence he graduated M. B. in 1840, and M. D. in 1843. He served successively as house-surgeon and house-physician to the University College Hospitals. In 1846 he became a member of the Royal College of Physicians and in 1851 was elected a fellow. He was also elected a fellow of the Royal Society in 1871 and has held many other positions of responsibility and honor. From 1848 to 1875 he was connected with the hospital for diseases of the chest at Brompton, and afterwards was consulting physician. As member of the royal commission of the cattle plague he was active in directing the investigation, in determining the plan for its extinction and in securing public approval for this plan. His principal work is the *Dictionary of Medicine* (1882), and he also contributed valuable articles to medical journals and to the *Transactions* of learned societies. He was appointed in 1863 crown representative in the general medical council, and was several times reappointed. He died Sept. 17, 1887.

QUAKERS OR FRIENDS IN AMERICA. The arrival at Boston in July, 1656, of the English preachers, Mary Fisher and Anne Austin, was the first appearance of the Friends in America. The Massachusetts Colony immediately legislated (first in October, 1656) to suppress Quakerism. Fines, whipping, mutilation, imprisonment, banishment, etc., were provided in several successive laws, and that of October, 1658, prescribed death as a penalty for those returning after banishment. Under this, in 1659 William Robinson and Marmaduke Stevenson, and in 1660 Mary Dyer and William Leddra, were hanged on Boston Common, for persistence in remaining in the colony and preaching. Minor persecutions continued for many years. (An extensive literature, considerably enlarged in recent years, relates to the history of this subject, as viewed from the Puritan, the Quaker, and other standpoints.) All the other early colonies, except Rhode Island, also persecuted the Friends, but less severely than Massachusetts. Their preachers, however, continued to arrive from England, and the Society had members, by 1660, in Rhode Island, on Long Island, and in Maryland and Virginia, besides those who remained in Massachusetts. The first regular business meeting of importance is presumed to have been held in Rhode Island in 1661—an annual gathering. In

1671-72 William Edmundson and John Burnyeat, preachers of note from Great Britain, travelled through the Friends' communities, and did much to promote an organization of their meetings; and in 1672-73 George Fox visited the colonies from Rhode Island to North Carolina, further advancing this work. About 1670, or somewhat earlier, meetings were established in New Jersey, at Shrewsbury and elsewhere, and there were Friends in North Carolina about 1672. The purchase of West Jersey, in 1674, by the English Friends, and the grant of Pennsylvania to William Penn in 1681, brought companies of Friends to both banks of the Delaware. In 1675 they settled the town of Salem, and in 1677 Burlington, and in 1682 Philadelphia was laid out, and its building begun. Large immigrations of Friends and those in sympathy with them, such as the German Mennonites, followed to Pennsylvania in the next half century. In 1768 there were in all the North American provinces about 250 meetings for worship, distributed substantially as follows: Rhode Island and adjoining parts of Massachusetts, 48; Long Island and vicinity of New York city, 20; Pennsylvania, New Jersey, and Delaware, 111; Maryland, 20; Virginia, 26; and North Carolina, 11.

The changes in the Society since the colonial period may be briefly stated as follows: During the Revolutionary war a considerable but not relatively large loss of members was sustained, by the departure of those who took part in it from the peace testimonies of the Society. In New York and East New Jersey many of these sympathized with the mother country; in Pennsylvania and West Jersey the ratio was largely in favor of the colonies. About the close of the century and later, the North-western Territory being opened, an extensive migration of the North Carolina Friends took place, whole meetings going together to Ohio and Indiana. Similar movements of like character occurred from Eastern Pennsylvania to Upper Canada and to South-western Pennsylvania.

There had always been an extensive interchange of ministerial visits between Great Britain and this country. Between 1656 and 1818 the religious visits of British preachers to this country numbered 183; and the corresponding visits of American Friends to Great Britain (begun about 1693) numbered 110. About 1800, and from that date to 1825, the English preachers, influenced at home by the Evangelical movement begun by Wesley and others, began to find what they regarded as evidences of unorthodox views in this country, and they especially condemned the doctrines of Elias Hicks (1748-1830), a prominent minister of Long Island. In 1827 the Yearly Meeting of Phila-

delphia (by far the largest of the yearly meetings) divided, the minority basing their discipline upon orthodox doctrine. Other divisions followed in the Yearly Meetings of New York, Ohio, Indiana, and Baltimore. Those of New England and North Carolina did not divide, remaining with the Orthodox body.

Since 1830 several divisions have occurred among the Orthodox Friends, and they now form four bodies, as follows: (1.) Yearly meetings affiliating with each other and corresponding with London Yearly Meeting. This body is frequently designated as Gurneyite, from the fact that it sympathizes, generally, with the views of Joseph John Gurney, an English Friend (1788–1847), who visited this country in 1837–38, and whose views were opposed by John Wilbur, of Rhode Island, causing a division which extended to several yearly meetings within the following fifteen years. (2.) Yearly meetings of the “Wilbur” view, corresponding with each other, but not with any other of the Orthodox bodies, and not “recognized” by London. (3.) Philadelphia Yearly Meeting, which has avoided official commitment to either the Evangelical (or Gurney) views, on one hand, or the Wilburite on the other, and has sustained no division. It corresponds (1888) with no other body, though acknowledging the general relation of other Orthodox yearly meetings to itself, by receiving their members and ministers (the latter under carefully guarded rules, recently adopted). (4.) Smaller bodies, which have separated from the others, and have called themselves Primitive Friends, etc.

The body which did not disown the ministrations of Elias Hicks, in the controversy of 1827, remains unchanged, except by diminution. In the Western States, especially Ohio, Indiana, Iowa, and Kansas, the Orthodox (Class 1, above) have made considerable growth. They have adopted to some extent the methods of other churches, including prearranged services, salaried and stationed “pastors,” singing during worship, etc., and some of their ministers have been baptized by immersion. They maintain missionaries in the West Indies, Mexico, and elsewhere. It is these methods, as well as doctrinal divergencies, which have caused the separation from them of the “Wilburite” and smaller bodies.

Statistics.—The census of 1880 stated the whole number of Friends in the United States at 95,966, with property valued at \$3,202,142, and 986 meeting places. These totals were divided as follows:

	No.	Val. Prop.
1. Orthodox [including Philadelphia Yearly Meeting].....	66,738	\$1,951,847
2. “Hicksite”.....	23,568	1,181,333
3. “Wilburite” Orthodox.....	4,742	41,285
4. Smaller bodies.....	618	27,677

The changes since 1880 in Classes 2, 3, and 4, above, have been unimportant. The Orthodox (Gurneyite) Evangelical body has made a growth in the Western States, by bringing in new members, mainly through “revival” methods. Its number (excluding Philadelphia Yearly Meeting) was estimated, 1887, at 72,500. It has ten yearly meetings in the United States and Canada: New England, New York, Canada, Baltimore, North Carolina, Ohio, Indiana, Western Iowa, and Kansas. The body, often called “Hicksite” (it is proper to say they disown this designation, and call themselves simply “The Religious Society of Friends”), has seven yearly meetings: Philadelphia, New York, Genesee, Baltimore, Ohio, Indiana, and Illinois. They have no meetings in New England or south of Virginia. Meetings have recently been organized in Nebraska, which is the farthest west. Their number is estimated, 1888, at 23,000, of which about half are in Philadelphia Yearly Meeting.

Several educational institutions of importance are in charge of the Friends. In the rank of colleges are Haverford, for young men, and Bryn Mawr, for young women, both near Philadelphia; Wilmington, at Wil-

lington, Ohio; Earlham, at Richmond, Indiana; and Penn, at Oskaloosa, Iowa—all belonging to the division called Orthodox. They have also several preparatory schools of note, the most prominent of which are those at Providence, R. I., and Westtown, Pa. The other principal body of Friends have Swarthmore College, near Philadelphia, for both sexes.

Bibliography.—For details concerning Friends in America, of the first importance is James Bowden's *History* (London, 1850); see also S. M. Janney's *History of Friends* (Phila., 1859); Janney's *Life of William Penn* (Phila., 1852); *Collection of Memorials* (Phila., 1787), and other collections of later date; T. Gilpin's *Exiles in Virginia* (Phila., 1848); *Account of the Conduct of Friends towards the Indian Tribes* (London, 1844); Michener's *Retrospect of Early Quakerism* (Phila., 1860); *Friends' Miscellany*, edited by John and Isaac Comly (12 vols., Phila., 1831–39); *Friends' Library*, edited by William and Thomas Evans (14 vols., Phila., begun 1837); R. P. Hallowell's *Quaker Invasion of Massachusetts* (Boston, 1883). There are many journals of ministers, one of the most notable being that of John Woolman, of New Jersey (1720–1772), of which many editions have been issued, one (Boston, 1882) edited by John G. Whittier. The questions arising out of the several divisions have given rise to a large number of controversial and doctrinal issues. Besides those relating to the division of 1827, others of interest are John Wilbur's *Narrative* (New York, 1845); and William Hodgson's *Society of Friends in the 19th Century* (Phila., 1876). (H. M. J.)

QUARANTINE. In the United States, and among civilized nations generally, this word no longer signifies “forty days’” detention (p. 153 (p. 159 —it simply means “maritime sanitation”—and although still used to denote detention for an uncertain period (it may be only a few hours or at most a few days) it is now practised in connection with other measures employed by those in authority for placing the vessel, person, or thing detained in a thoroughly sanitary condition. (See SANITARY SCIENCE.)

“Shot-gun” quarantine is an unscientific if not a lawless procedure indulged in by panic-stricken inhabitants who, with deadly weapons in their hands, threaten to shoot any person from an infected district who seeks to enter or pass through their lines—*cordon sanitaire*. Although semi-barbaric and brutal, it exists in some parts of the United States to this day. (P. H. B.)

QUATREFAGES DE BRÉAU, JEAN LOUIS ARMAND DE, a French naturalist, was born at Berthezème, Department of Gard, Feb. 10, 1810. He studied medicine and natural sciences at Strasburg and received his doctor's degree in 1829. He lived for some years at Toulouse, where in 1838 he was made professor of zoölogy. But he soon went to Paris, and in 1842 he commenced a series of scientific voyages along the Atlantic and Mediterranean coasts. In 1850 he was appointed professor of natural history in the Lycée Napoleon, and in 1856 exchanged this post for the professorship of anatomy and ethnology in the Museum of Natural History. His extensive investigations in zoölogy, comparative anatomy, and anthropology have afforded subjects for many works. Among the principal are *Études sur les types inférieurs de l'embranchement des annelés*; *Souvenirs d'un Naturaliste*, (1854); *Physiologie comparée, Métamorphose de l'Homme et des Animaux* (1862); *Histoire de l'Homme* (1864); *Charles Darwin et ses Précurseurs français* (1870); *La Race prussienne* (1871); *Crania ethnica* (1875–79); *L'Espèce humaine* (1877). Miss E. L. Youmans translated his *Natural History of Man* (1875) and others of his works have appeared in English.

QUINCE. This plant, *Cydonia vulgaris*, so named from Cydonia, in Crete, its native place, is a well-known, hardy, deciduous fruit-tree, of the order *Pomaceæ*, being distinguished from the genus *Pyrus* by its leafy calyx lobes and the many-seeded cells of its fruit.

See Vol. XX. p. 182 (p. 188 Am. Rep.).

It is a low, straggling tree, of from 8 to 15 feet high, with a crooked stem and twisted branches, a smooth, blackish bark, and large flowers with five red or white petals and twenty or more stamens. The fruit is large and globular or pear-shaped, of a rich yellow color when ripe, with a peculiar pleasant odor, which, when strong, many find disagreeable. The quince now grows spontaneously in the

Meech's Quince.

the south of France and along the Danube. It was much esteemed by the ancients, who looked upon it as an emblem of love and happiness. There are several varieties, the most distinct being pear-shaped, which is thought the typical form, and which bears most abundantly. The apple-shaped quince, however, is most esteemed. The plant needs a rich, mellow

soil, and well repays manuring. It is readily propagated from the seeds. Its most dangerous enemies are a borer, which is very destructive, and a peculiar yellow fungus, which attacks the young trees. It is much used as a stock for the budding of the pear, the Portugal variety being the best stock. The fruit is hard, with an austere taste, and is chiefly used for preserving with sugar and in the making of marmalades, jellies, etc. In England a wine is made from the juice. The mucilaginous seeds are employed in pharmacy and the toilet. The wood is hard, and is employed in turning.

Of the other species of *Cydonia* the Chinese quince is a very handsome tree, twenty feet high and of arborescent growth. The Japan quince, *C. Japonica*, is a low, straggling tree, but is valued as an ornamental plant, for the rich and abundant crimson blossoms which it bears in early spring.

QUINCY, a city of Illinois, county-seat of Adams co., is on the Mississippi River, 160 miles above St. Louis. It is on a limestone bluff, 125 feet above the river, and is an important railroad town. While Quincy Bay gives a fine harbor for steamboats, an important railroad bridge here crosses the stream. Quincy has a fine court-house which cost \$300,000, 2 opera-houses, 2 armories, numerous public halls, 7 banks, a cathedral and 35 churches, a medical college, several hospitals and asylums. Five daily and 8 weekly newspapers and 3 monthly magazines are published here. The industrial works comprise large flour-mills, saw- and planing-mills, stove-works, breweries, and factories producing carriages, furniture, sash, blinds, and tobacco. Quincy is finely laid out, has gas and electric light, street railways, good water-works and an excellent fire department. It was settled in 1822 and was made a city in 1839. In 1880 its population was 27,268.

QUINCY, the name of a family noted in the history of Massachusetts. JOSIAH QUINCY, Jr. (1744-1775), was renowned for his eloquent advocacy of the rights of the colonists. His son, JOSIAH QUINCY (1772-1864), in his long life was a prominent leader of the Federal party, afterwards mayor of Boston (1822-29), and a promoter of its improvements; then an able president of Harvard University (1829-45). The career of these distinguished men has been sketched in the *ENCYCLOPÆDIA BRITANNICA*. Others of the family deserve mention.

EDMUND QUINCY (1681-1738) graduated at Harvard College in 1699. He was a member of the General Court and of the Governor's Council for many years. In 1718 he was made Judge of the Superior Court, and in 1737 went to England to conduct the case of Massachusetts in a boundary dispute with

New Hampshire. He died at London, Feb. 23, 1738, and the colony ordered a monument to be erected to his memory there.

Another EDMUND QUINCY (1808-1877), son of President Quincy, was born at Boston, Feb. 1, 1808. He graduated at Harvard College in 1827, and was secretary of the American Anti-Slavery Society. He published a novel, *Wensley* (1854), and a biography of his father (1867), and edited his father's *Speeches* (1875). He died May 27, 1877.

His brother, JOSIAH QUINCY (1802-1882), graduated at Harvard in 1821, studied law, and was active in the public affairs of Massachusetts. He was president of the State Senate in 1842 and mayor of Boston in 1845. In his term the water supply from the Cochituate was introduced. Other improvements were also promoted by him. Shortly before his death he contributed to the *Independent* sketches which have been collected under the title, *Figures of the Past* (1882).

His son, SAMUEL MILLER QUINCY, born in 1833, became a lawyer and edited the *Monthly Law Reporter*. Entering the army during the civil war, he rose from the rank of captain to that of colonel with the brevet of brigadier-general. He edited the *Reports of the Superior Court of Massachusetts*, 1761-72 (1865), made by his great-grandfather, Josiah Quincy, Jr.

His brother, JOSIAH PHILLIP QUINCY, born in 1830, has published dramatic poems, *Lyteria* (1856), and *Charicles* (1856).

QUININE. The history of the manufacture of sulphate of quinine in the United States is interesting. The manufacture of this alkaloid was begun by John Am. Rep.).

Farr, an eminent chemist of Philadelphia, in the year 1820. The process was crude though complicated, and, with the appliances then available, the manufacture of a few ounces was considered an important undertaking in chemical laboratory work. Prior to the date mentioned all the quinine was imported at high cost. The record of the first authentic sale of quinine in the United States gives the price realized as \$200 per ounce, and Samuel Hart, a druggist of Philadelphia, as the seller. The date is not known, though believed to be 1815. The first lots sold by Mr. Farr were at \$8 per drachm.

The crude material (cinchona bark) was for many years received direct from the forests of South America, where the tree is of indigenous growth. The Peruvian government for many years enjoyed a monopoly of the trade in cinchona bark, and as the price was gradually advanced the manufacturing chemists extended their investigations. They soon discovered that lower grade barks from other sections could be used, and this resulted in a destruction of the monopoly. As the consumption of quinine increased, the question of future supply of the raw material became a serious one, as it was feared the supply could not be increased to keep pace with extending consumption. Fearing the exhaustion of the supply of bark in South America, the cultivation of cinchona trees was undertaken in Ceylon and Java, which, proving successful, an abundant supply is now assured. (See article CINCHONA in *ENCYCLOPÆDIA BRITANNICA* and in this work.)

The successor to John Farr in the manufacture of quinine was the firm of Farr, Powers & Weightman, Philadelphia, which for many years was the only firm engaged in the business, though latterly the name has been Powers & Weightman. Two other firms of manufacturing chemists, in the same city, began at a later date the manufacture of the alkaloid, namely, Rosengarten & Sons and Kearby & Mattison. Still later the firm of Charles T. White & Co., of New York, engaged in the business, and, about 1885, a company was organized in the city of New York for the manufacture of this alkaloid. At no time, however, have there been more than four manufacturers of quinine in the

United States. After the removal of the duty on foreign quinine in 1879 the manufacturers could not compete with the imported article, and one after another abandoned the business, until, at the present time, but one firm continues the manufacture of quinine, and that is the oldest in the business.

About the time of the removal of the import duty on quinine, cheaper processes for the manufacture of the alkaloid were discovered, and the new sources of supply of the crude material furnishing bark of improved quality in unexpected abundance, the price declined steadily, and foreign competition has continued so active that the business has for several years been unremunerative. The imports of foreign quinine during the six years preceding the removal of the import duty averaged about 70,000 ounces per year. Since the removal of the duty the imports have increased steadily, reaching, in 1887, the enormous amount of 2,180,000 ounces. The imports of cinchona bark also show the effect of the competition of the foreign product. The total consumption of quinine in the world at the present time is estimated at 7,000,000 ounces per annum, and of this 3,000,000 ounces are consumed in the United States. Fully two-thirds of the quinine consumed in the United States is therefore of foreign manufacture, and none of the domestic made is now exported. Formerly there were considerable annual exports to Mexico and the South American states.

In the following table are given the highest and lowest prices of American quinine, per ounce, from 1823 to 1888:

Year.	Highest.	Lowest.	Year.	Highest.	Lowest.
1823.....	\$20.00	\$16.00	1856.....	\$2.60	\$2.40
1824.....	14.00	12.00	1857.....	2.00	1.40
1825.....	8.00	8.00	1858.....	1.40	1.25
1826.....	7.00	5.25	1859.....	1.50	1.25
1827.....	7.50	6.00	1860.....	1.80	1.20
1828.....	6.00	3.25	1861.....	2.10	1.80
1829.....	2.90	2.25	1862.....	2.90	2.25
1830.....	2.50	1.75	1863.....	3.25	2.70
1831.....	1.50	1.35	1864.....	3.75	2.60
1832.....	1.00	1.75	1865.....	3.40	2.20
1833.....	1.87	1.70	1866.....	2.60	2.25
1834.....	1.80	1.25	1867.....	2.20	1.95
1835.....	1.65	1.60	1868.....	2.35	1.90
1836.....	1.58	1.45	1869.....	2.30	2.00
1837.....	1.40	1.40	1870.....	2.30	2.10
1838.....	1.90	1.60	1871.....	2.45	2.20
1839.....	3.30	2.75	1872.....	2.45	2.40
1840.....	3.12	2.87	1873.....	2.55	2.45
1841.....	2.62	2.50	1874.....	2.50	2.20
1842.....	2.00	1.60	1875.....	2.30	2.15
1843.....	1.80	1.55	1876.....	2.70	2.20
1844.....	3.00	2.00	1877.....	4.50	2.70
1845.....	2.40	2.35	1878.....	3.60	3.40
1846.....	2.40	2.20	1879.....	3.60	2.60
1847.....	2.40	2.30	1880.....	3.25	2.25
1848.....	2.70	2.60	1881.....	3.25	1.90
1849.....	3.65	2.95	1882.....	2.50	2.00
1850.....	3.70	3.70	1883.....	1.80	1.55
1851.....	3.25	3.25	1884.....	1.75	.90
1852.....	3.00	2.80	1885.....	1.05	.75
1853.....	3.20	2.70	1886.....	.80	.65
1854.....	2.50	2.50	1887.....	.70	.46
1855.....	3.00	2.60	1888.....	.56	.47

Over half a century's growth of the business of manufacturing quinine brought it to a prosperous condition, making it an important chemical industry. The past eight years has witnessed its decadence, until, at the present time, it is an unprofitable product among many in but one chemical manufacturing establishment, yet it is one of the most important articles of the *materia medica*, and its consumption continues to increase from year to year. (H. G. A.)

QUITMAN, JOHN ANTHONY (1799-1858), a Southern general and politician, was born at Rhinebeck, New York, Sept. 1, 1799. He was the son of Rev. Frederick Henry Quitman (1760-1832), a Lutheran minister. After becoming a lawyer he removed to Ohio in 1820, but in 1823 settled at Natchez, Miss. Having won distinction at the bar he was made

chancellor of the Superior Court in 1828, and took part in the Constitutional Convention of 1831. For many terms he served in the Legislature, and in 1835 was acting governor of the State. The movement for the independence of Texas received his hearty support, and, when the Mexican war followed as its consequence, Quitman was one of the foremost volunteers. He commanded a division of Gen. Scott's invading army, and, when the city of Mexico was taken, he was made its governor until peace was concluded. In 1850 Quitman was elected governor of Mississippi, and gave every possible encouragement to the movement for the annexation of Cuba to the United States. (See CUBA.) But the administration at Washington baffled his schemes; by its order he was indicted in the U. S. Court at New Orleans, whereupon he resigned his governorship, to avoid an unseemly struggle between national and State authority. A new administration showed evident favor for Cuban annexation, but the plan remained in abeyance, while the struggle in Kansas demanded all the strength of the advocates of slavery extension. Quitman was obliged to forego the promised command of an army for liberating Cuba from the Spanish yoke. At the inauguration of Pres. Buchanan he led the military procession, and fondly hoped that the time had come for the realization of his cherished plans. Again disappointed, he died at Natchez, July 17, 1858.

QUO WARRANTO is the name of a writ by which the government commences an action to recover an office or a franchise from the person or corporation illegally in possession of it. Formerly, in England, the king, by virtue of his prerogative, sent commissions over the kingdom to inquire into all franchises granted by the crown; and if those in possession of them could not show a charter, the franchises were seized into the king's hands without any judicial proceeding. The statute of 6 Edw. I. prescribed the action of *quo warranto*, in which the writ commands the sheriff to summon the defendant to appear before the court and show (*quo warranto*) by what authority he claims the office or franchise. It is a proceeding to try the mere right to the franchise or office, where the possessor never had a right to it, or has forfeited it by neglect or abuse.

In the United States the writ of *quo warranto* has been superseded by what is called an *information* in the nature of a *quo warranto*, in form a criminal though in substance a civil proceeding. The person at whose instance it is instituted is called the relator. Proceedings referring to the usurpation of the franchises of a municipal corporation must be begun by the State through the attorney-general. In regard to the election of a corporate officer, however, the writ may issue at the suit of the attorney-general or of any person interested. It has been held in various States that *quo warranto* proceedings may be brought against members of a city council, a county treasurer, a sheriff, a governor or lieutenant-governor, a judge of probate, a presidential elector (proceedings being taken in the name of the United States), militia officers, etc. The State is not bound to show anything, but the defendant is bound to show a right to the office or franchise in question.

There are two forms of judgment—against an officer or individuals it is *oust*; i. e., that he or they be put out simply, for there is no franchise forfeited; against a corporation, by its corporate name, it is *oust* and *seizure* of the corporate franchise. This is done on the principle that the franchise is a trust, of which the terms of the charter are the conditions; consequently, if any of the conditions be violated, it will work a forfeiture of the charter. Moreover, the corporate powers must be strictly construed, and exercised in the manner and form as well as by the agents prescribed in the charter.

Forfeitures may be brought about in two cases:

1. *In case of perversion*—as where a corporation does an act inconsistent with the nature and destructive of the ends of the grant; the perversion, however, must be such as to amount to an injury to the public, who are interested in the franchise. 2. *In case of usurpation*, as where a corporation exercises a power which it has no right to exercise; there is in such case no question as to injury to the public.

In England, corporations are the creations of the crown, and on dissolution their franchises revert to the crown; they may, however, be granted anew to the old corporators or to others. In the United States, corporations are the creatures of the Legislature, and on dissolution their franchises revert to the State. The Legislature has the same powers with respect to franchises as the English crown. (T. R.)

R.

RABBIT. The derivation of this name is by no means clear. The old Dutch *robbe*, the Walloon *robette*, and a local French form *rabette*, names for the European rabbit or the hare, are no doubt allied to this word. As to whether there is any connection between these names and the Portuguese *rabão*, "short-tailed," or the Spanish *rabito*, "a short tail," from *rabo*, "a tail," there is much room to doubt; and the rapidly progressing science of strictly historical and documentary philology can alone settle the questions.

It is well known that all the so-called rabbits native to North America are in reality hares. (See HARE.) The hares live and breed almost entirely in forms or rude nests, rather than in burrows, like the true rabbits. Moreover, the young at birth have a well-developed coating of hair and can see; while the true rabbits are born blind and hairless. The only true rabbit known in North America is the common domesticated rabbit introduced from Europe. Thus far, this animal has scarcely become naturalized in this country. Yet in Australia and New Zealand it has bred so rapidly in the wild state as to have become an intolerable pest and nuisance. There are parts of this country, like the Pacific States and the warmer parts of the South, where the climatic conditions are such as would seem favorable to the naturalization, on a hurtful scale, of the common rabbit; and reports have been printed of places in the Gulf States in which the animal is to be found in what might be called a half-wild condition. It is to some extent naturalized in tropical and South America. Among the hares mis-called rabbits in our country attention may be called to the so-called "jack-rabbits" or Jackass rabbits of the Far West. The large and very long-eared Texan hare (*Lepus Texanus*) appears to have been the first to receive this title. *L. callotis* of the South-west, and *L. artemisiæ* and *L. Californicus* of the Pacific slope, are about equally remarkable with the Texan hare, in respect to development of the ears. But at present the name is generally given to *L. campestris*, the prairie-hare. One of our rabbits, *Lepus Bairdii*, from the Rocky Mountain region (probably only a variant form of the prairie hare) is, according to very respectable authority, distinguished among mammals as the only known species in which both male and female regularly produce milk and suckle their young. If this observation be correct, the anomaly may possibly be due to the scantiness of local vegetation, and the long duration of the summer droughts, which might very naturally reduce the secretion of milk in the female to such an extent as to call for a subsidiary supply from the male parent. Many exceptional cases of male lactation, even in the human species, have been reported; and there is no known reason why the male mammary gland, which in its structural elements is identical with that of the female, might not, under appropriate conditions, afford milk. (C. W. G.)

RABIES. See HYDROPHOBIA.

RACCOON. This familiar American animal is

well described in the *ENCYCLOPÆDIA BRITANNICA*. Besides the true raccoon, however, there are found in the South-western parts of the United States and in Mexico two interesting mammals, *Bassaris astuta* and *B. sumichrasti*, to which recent authors give the name raccoon fox. The structure and other peculiarities of these creatures clearly mark them off from every other family of carnivorous mammals, and their true position has been much disputed. At present they are by common consent placed by themselves in a family, *Bassaridæ*; and they are generally assigned to a place among the *Arctoidea* or bear-like animals. Among their popular names are coon-bear and civet. The ringed tail, arboreal habit, and playful, sociable disposition in captivity all prove a relationship to the raccoons; and in some parts of the country the raccoon fox is considered as a true raccoon—which it very certainly is not. The head and ears have a decidedly fox-like appearance. This little animal is easily tamed and soon becomes a great favorite in the frontiersman's cabin. The females are very much smaller than the males, and the males are smaller than the true raccoons.

RACINE, a city of Wisconsin, the seat of Racine co., is on the W. shore of Lake Michigan, 62 miles N. of Chicago and 23 miles S. of Milwaukee. It is the second city of the State in population and commerce. The Chicago and North-western and the Chicago, Milwaukee, and St. Paul Railroads as well as steamers on the lake in summer afford freight and travelling facilities. The city is on a plateau about 45 feet above the level of the lake, and is divided into two sections by Root River, across which there are five swing-bridges. It has a court-house, a handsome post-office building, a fine city-hall, 2 hospitals, 3 hotels, 3 national banks, 28 churches, 2 daily and 6 weekly newspapers. Besides the public schools, which have 6 large buildings, there are excellent private academies and the Church University of the North-west, which is under Protestant Episcopal control. This institution was founded in 1852 and was formerly known as Racine College. Taylor Orphan Asylum has a fine building about two miles from the heart of the city. The lumber trade of Racine is very large. Its manufactures comprise agricultural implements, pumps, wagons, cordage, furniture, fanning-mills, boots and shoes, rubber clothing, refrigerators, baskets, hardware, and wire work. It has also flour-, woollen-, and flax-mills, boiler-works, linseed-oil-works, etc. Racine was settled in 1834 by Gilbert Knapp, chartered as a village in 1841, and incorporated as a city in 1848. Its assessed valuation in 1886 was \$8,287,400; its public debt \$183,500 and its yearly expenses about \$150,000. The city is lighted with gas and electric light, has street railways, two parks and water-works and two artesian wells. It has twice suffered from large fires, in 1866 the loss being \$150,000, and in 1882 being \$800,000. In 1883 a destructive cyclone passed over the northern part of the city. There is a paid fire department, efficient and well supplied with apparatus. The population

was 16,031 in 1880, and by the State census of 1885 was 19,636.

RADISH, *Raphanus sativus*, a hardy annual originating in China, but now widely grown for its much-esteemed salad root. The plant when in flower is from three to four feet high, and bears large white or purplish flowers, and long smooth seed-pods. In Southern Asia the radish grows at a height of 16,000 feet on the Himalayas. In Norway it is cultivated beyond the latitude of 70°. All varieties succeed best in a light, rich, sandy loam, aided by manure rich in lime. The plant usually suffers in summer heat and drought, and when grown then the root is generally fibrous and very pungent. It is sometimes sown in beds of asparagus for the benefit of the shade and moisture. The root of the radish varies in shape from round or ovoid to a long tapering form. Its excellence consists in its succulent, crisp, and tender condition, qualities which can only be attained by rapid growth, so that the plant needs to be copiously watered in dry weather. Like most of the cruciferous salad plants, radishes are pungent and antiscorbutic. They are apt to be indigestible from their excess of woody tissue. The seeds of some varieties of the plant yield an oil almost identical with rape and colza oil. (C. M.)

RAFINESQUE, CONSTANTINE SCHMALTZ (1783-1842), an eccentric naturalist, was born at Constantinople, Oct. 22, 1783. His father was a French trader, and his mother, though born in Greece, was of a German family. In infancy he was taken to Marseilles and afterwards to Leghorn. He early developed a taste for natural science. In 1802 his father sent him to Philadelphia where he was employed in a counting-house, but his vacations were spent in rambling on foot in Pennsylvania and Virginia. In 1805 he went to Sicily to engage in business and for a time enjoyed a monopoly of the trade in squills, which he had discovered there. His labors in natural history are attested by his *Flora of Sicily* (1810), *Sicilian Ichthyology* (1810), and *Sicilian Crabs* (1814). The English ornithologist, William Swainson, paid a visit to Rafinesque in Sicily. In 1815 the latter returned to the United States, but on his voyage was shipwrecked near New London, Conn. His collection, manuscripts and drawings, were lost. He became a tutor in New York, but soon resumed his wanderings. In 1818 he was made professor of natural history and modern languages in Transylvania University, Lexington, Ky., but soon quarrelled with its authorities. He came in contact with Audubon, the ornithologist, who did not disdain to impose on the simplicity of the wanderer. Hence in his *Ichthyologia Ohionensis* (1824) appear some strange fish which have been a puzzle to later naturalists. Rafinesque's investigations were not confined to fishes and birds. He studied in his way the languages and customs of the Indians and projected various inventions. In 1830 he went to Philadelphia, and thenceforth published various magazines and histories, a poem called *The World: or Instability*, and a meagre autobiography called *A Life of Travel and Researches* (1836). He died at Philadelphia, Sept. 18, 1842. Rafinesque rejected the Linnæan system in botany and anticipated to some extent Darwin's theory. Between him and the naturalists of his time there was a strong repugnance, but Agassiz and a few of his successors have admitted some merit in his work. Many of his manuscripts are in the U. S. National Museum, but others are lost, and his publications are rare.

RAHWAY, a city of New Jersey, in Union co., is on the Rahway River, 4 miles from its mouth, and 19 miles S. W. of New York on the New York division of the Pennsylvania Railroad. It has 2 national banks, 2 savings banks, 18 churches, 2 weekly newspapers, and manufactures of carriages, wheels, axles, springs, printing-presses, shoes, and clothing. It was

settled in 1720, and incorporated as a city in 1858. Its population in 1880 was 6455.

RAILROADS IN THE UNITED STATES.—The subject of internal improvements, particularly that of improved means of internal communication for the colonists, was one that received considerable attention from the fathers of our country. The internal commerce of the United States, unlike that of any other country, has become almost wholly the creation of public works. The chief markets for its products, whether for home consumption or for exportation, are, and always have been, within a narrow strip of territory skirting the seaboard from Baltimore northward to Portland. The early settlements, from want of even ordinary highways, were necessarily made upon the navigable water-courses. When inland settlements were made the lack of suitable avenues for the transportation of their products to market was felt to be a serious check to their prosperity and progress. The subject engaged the attention of Washington at an early period in his life. He crossed the Allegheny range of mountains for the purpose of ascertaining whether a canal could be constructed from the navigable waters of the Chesapeake to the Ohio. Before the outbreak of the Revolutionary war, as a member of the House of Burgesses of Virginia, he urged the consideration of this subject upon that body. After the close of the war, and till his election as President of the United States, he was unremitting in his efforts to promote the construction of such works. He was president of the company first formed in Virginia to execute it. He also visited the State of New York, passed up the Mohawk to the summit from which the waters flow into the Hudson River on the one hand and into Lake Ontario on the other. At this point the Allegheny range falls off into a vast plain depressed 145 feet below the surface of Lake Erie, and 109 feet below the summit, which, near Chicago, separates the waters flowing into Lake Michigan from those flowing into the Mississippi. This physical feature, in one sense so unimportant, has exerted a paramount influence on the destinies, moral, political, and material, of the continent. It gave to the North the monopoly of its commerce, which brought supremacy in wealth, and in the West it made the lines of the Great Lakes the future seat of empire.

The first attempt to realize Washington's idea of binding by commercial interests the East and West was made, not in Virginia, but in the State of New York. In 1792 two companies—the "Western" and the "Northern Inland Navigation Company," of that State—were organized, the former undertaking the work of constructing what was termed a "lock navigation" from the Hudson to Lake Ontario, and the latter a similar work from Albany to Lake Champlain. The former constructed a canal which, being on a very small scale, proved wholly inadequate to its object, was unremunerative, and was speedily abandoned.

The next attempt of the kind grew out of the painful sense of the disasters suffered in the war of 1812, and in consequence of the difficulty in moving troops and munitions of war from the seaboard to the seat of hostilities in the line of the lakes and the St. Lawrence. The people of New York, in whose territory the war was chiefly waged, determined at its close to construct, with the least possible delay, a canal extending from the Hudson River at Albany to Lake Erie at Buffalo. On April 15, 1817, the Legislature passed an act, making provisions by means supplied by itself for the construction of such a canal, and on Nov. 14, 1825, the completion of the work was celebrated. (See CLINTON, DEWITT.)

From the success which followed the opening of the Erie Canal, the States of Pennsylvania, Maryland, Virginia, Ohio, and Illinois at once embarked on elaborate systems designed to give to almost every portion

of their respective territories the advantages of canal navigation.

Earliest Railroads.—The very year that the Erie Canal went into operation an event, hardly to be matched for its importance, occurred—the successful application on the Stockton and Darlington Railway of steam to purposes of locomotion. The railroad first undertaken in the United States was a short line of about three miles for the transportation of granite to the Neponset River, near Boston. This road was simply a copy of the tramroads already in use in England. It was important only as the pioneer of the great movement that was then taking place. A similar work was constructed about the same time for the transportation of coal from the pit's mouth to the Lehigh Valley Canal, near Mauch Chunk. It was not until 1828, however, that the construction of a railroad was undertaken for the transportation of freight and passengers on anything like a comprehensive scale. The construction of the Erie Canal had cut off the trade which Philadelphia had hitherto received from the West, and as the project of a canal from Baltimore to the Ohio was regarded by many as impracticable, the merchants of that city, in 1827, procured the charter of the present Baltimore and Ohio Railroad. On July 4, 1828, its construction was begun, the first act being performed by the venerable Charles Carroll, of Carrollton, the only surviving signer of the Declaration of Independence. At the close of the ceremony of breaking ground Mr. Carroll said: "I consider this among the most important acts of my life, second only to that of signing the Declaration of Independence, if even second to that." In the fall of 1829 the laying of the rails within the city of Baltimore was begun. On May 24, 1830, the first section of 14 miles, to Ellicott's Mills, was opened. Like all others constructed at the time, it was an unsubstantial structure, with longitudinal sills, on which was placed a thin bar or strap of iron. Although locomotive-engines had obtained some use in England, this road continued for nearly a year after its opening to be operated by horse-power. An ingenious but unsuccessful attempt was made to propel the trains by the use of sails. As some more efficient power than that of horses seemed indispensable, the company, on the 4th of January, 1831, invited proposals for the construction of a steam-engine for its use, "which, when in operation, must not exceed 3½ tons in weight, and must, on a level road, be capable of drawing 15 tons, inclusive of the weight of the wagons, 15 miles an hour." In response three engines were offered to the company. Only one was accepted as coming up to the required specifications. Although this engine was incapable of surmounting any considerable grades, it served to assure the officers of the company of the practicability of their working their railroad by steam-power. In the annual report of the company for 1831 its president, Philip E. Thomas, stated that "by many improvements made in the application of working power, an immense reduction in the cost of transportation and an increase in velocity had been effected."

The first locomotive ever used in the United States was one imported from England in 1829, called the "Stourbridge Lion." It weighed six tons. The engine was imported for use on the Carbondale Railroad, belonging to the Delaware and Hudson Canal Co., and extending from their canal to the mines. The first experimental trip was made by it Aug. 8, 1829. It was found too heavy for the track, and its use consequently had to be abandoned. The first locomotive built in this country, and the second in use in it, was called "The Best Friend of Charleston," having been built for use on the South Carolina Railroad, then in process of construction. It arrived at Charleston Oct. 23, 1830, and was placed on the road Nov. 2, 1830. The third, also constructed by the West Point Company, was placed on the Mohawk and Hudson, now a part of the New York Central Railroad, in 1831, and weighed three tons. It was used on the summit be-

tween the two planes worked by the stationary engines, that near Albany having a length of 3102 feet; that near Schenectady 2046 feet.

As early as 1832 the use of locomotives may be said to have been fairly established. From that time the comparative excellence of the engines' improvements was the only subject for consideration. Constant and rapid improvements were made in their construction. The locomotives first constructed weighed only from three to six tons, and were hardly capable of drawing on a level road half of the weight of the improved machine of the present day. No sooner was the superiority of the railroad over the ordinary highway fully demonstrated, both in this country and in England, than a great many schemes were immediately set on foot.

Following the Baltimore and Ohio Railroad, the next important line to be constructed was the South Carolina Railroad, extending from Charleston to Hamburg, opposite Augusta, Ga. This line was begun in 1830, and opened for traffic in 1833 for its whole length—135 miles. At that time it was the longest continuous line of railroad in the world. The construction of the Mohawk and Hudson, now a part of the New York Central, was begun in 1830. It was opened (17 miles) in 1831. The Saratoga and Schenectady Railroad (21½ miles) was opened in the following year; the Cayuga and Susquehanna (34 miles), connecting the Susquehanna River with Cayuga Lake, was opened in 1834; and the Rensselaer and Saratoga (25 miles) in 1835. In New Jersey that portion of the Camden and Amboy extending from Bordentown to Hightstown (14 miles) was opened Dec. 22, 1830, and between Hightstown and South Amboy (47½ miles) in 1834. In Pennsylvania a considerable extent of line for the transportation of coal had been constructed previous to 1835. In 1834 the Philadelphia and Columbia (82 miles) and the Portage Railroad (36 miles), the latter forming a part of the system of public works undertaken by the State of Pennsylvania, were opened. Their completion gave that State a continuous line, made up of canal and railroad, from Philadelphia to the Ohio River at Pittsburg. The total mileage of railroad constructed in that State to the end of 1835 was 318 miles, or nearly one-third of the whole extent of the line then in use in the United States. In 1833 the Baltimore and Ohio Railroad was extended as far west as Harper's Ferry (81 miles). In Massachusetts, in 1835, the Boston and Worcester Railroad (44 miles), the Boston and Providence (41 miles), and the Boston and Lowell (26 miles) were all opened for business. The total extent of mileage in operation in all the States at the close of the year 1835 was 1098 miles.

Only a moderate degree of success, either financial or commercial, attended the railroads first constructed in this country. They were rude and unsubstantial structures, involving a heavy outlay for repairs, and were very inadequate to the service even then required of them. The superstructure of the lines first constructed was a longitudinal sill, the rail or strap of iron laid upon it serving to prevent the abrasion of the wood rather than support the train. The change from wood to iron was a very gradual one. It was not until 1850 that the longitudinal sill and the flat rail were entirely removed from the Utica and Schenectady, the most important link in the New York Central line. Many of the early roads were upon routes having little traffic, and were consequently almost entirely unremunerative. Nevertheless the construction of railways was steadily persisted in. The total extent of mileage in operation in all the States at the close of the year 1835 was 1098 miles.

From 1835 the construction of railroads proceeded at the rate of about 400 miles annually until 1842, when the first work of the kind built for the express purpose of reaching and controlling the internal trade of the country was opened—the line from Boston to

Albany, connecting at the latter place with the Erie Canal. In the same year the last link in the line from Albany to Buffalo was opened. Nothing, however, was further from the minds of the parties opening this line than a competition for the business of the canals.

The most important railroads opened between 1835 and 1842 were the Philadelphia and Reading, to the coal-fields of Pennsylvania, opened in 1838; and the New Jersey Railroad, forming, in connection with the Camden and Amboy, a through line between New York harbor and Philadelphia, opened in 1840. The Baltimore and Ohio was opened to Cumberland, 179 miles, in 1842. At the end of 1848 the total mileage of all railroads in the country was 5996 miles, the average annual rate of increase from the date of their introduction being 316 miles.

RAILROAD CONSTRUCTION.

First Period.—The history of American railroad construction divides itself into four periods of activity, with two additional periods of inactivity intervening. The first period, from 1830 to 1848, may be termed the experimental period. In the following statement is shown the annual increase of railroad mileage during these 19 years:

Year.	Miles in Operation.	Increase of Mileage.
1830.....	23	...
1831.....	95	72
1832.....	229	134
1833.....	380	151
1834.....	633	253
1835.....	1,098	465
1836.....	1,273	175
1837.....	1,497	224
1838.....	1,913	416
1839.....	2,302	389
1840.....	2,818	516
1841.....	3,535	717
1842.....	4,026	491
1843.....	4,185	159
1844.....	4,377	192
1845.....	4,633	256
1846.....	4,930	297
1847.....	5,598	668
1848.....	5,996	398

Of the total mileage completed in 1848, 1225 miles were in New England, 2350 in the Middle States, 419 in the Western States, and 1415 in the Southern States. Pennsylvania led the States with 1048 miles, New York following with 869 miles, and Massachusetts coming third with 790 miles.

During this experimental period the progress of railroads was slow and unpromising. Their construction, maintenance, and improvement had absorbed all the floating capital of the country. Converting vast amounts of mobilized funds into fixed capital, it helped to prepare the way for those terrible financial hurricanes which swept over the country in 1837 and 1847. Small as was the progress made it imposed too heavy a burden on the financial machinery of the nation; for so rudimentary was the industry of the country, and so slow its rates of increase, that the best located lines, instead of creating as they now do an annual traffic much exceeding their cost, were a heavy charge upon their promoters and stockholders.

The discovery in 1848, immediately after its annexation to the United States, of deposits of gold of marvellous richness in California created an excitement hardly less universal and intense than that which followed their first discovery in the New World. The effect upon the industries and commerce of the country of the sudden addition of more than \$50,000,000 annually to its circulating medium was prodigious. A new field was opened which absorbed no inconsiderable portion of the labor of the country at most remunerative rates. All sections were proportionately benefited. For the newly created enterprise of the nation the

railroad offered the most attractive and appropriate field. Foreigners shared fully with ourselves in the enthusiasm which prevailed and proffered almost unlimited sums for the prosecution of our public works.

Second Period.—From the discovery of gold in California in 1848 dates the second period in the history of railroad construction. Then began the great movement, which has since suffered no considerable check, and which has resulted in building up, in the New World, in the incredibly short period of 40 years, the most powerful, wealthy, and progressive nation in the universe.

The following statement exhibits the progress made annually in railroad construction in the whole country from 1849 to 1860:

Year.	Miles in Operation.	Increase of Mileage.
1849.....	7,365	1,369
1850.....	9,021	1,656
1851.....	10,982	1,961
1852.....	12,908	1,926
1853.....	15,360	2,452
1854.....	16,720	1,360
1855.....	18,374	1,654
1856.....	22,016	3,642
1857.....	24,503	2,487
1858.....	26,968	2,465
1859.....	28,789	1,821
1860.....	30,635	1,846

On the first day of January, 1849, a continuous line of railroad was first formed between Boston and New York by the completion of the New York and New Haven Railroad. In the spring of 1851 the Erie Railroad was completed from the harbor of New York to Lake Erie—an event of first-rate importance in the commerce of the country. In the same year a continuous line of railway was opened between Boston and the St. Lawrence, by the completion of the Vermont Central and Vermont and Canada Railroad—the line from Ogdensburg to Lake Champlain having been opened in 1850. In the fall of 1851 the Hudson River Railroad was completed, giving to the city of New York a second line of railway to the great lakes; but some ten years after the city of Boston had secured such a connection.

In 1852 another important extension of the railway system of the country was made by the completion of the Michigan Central and Michigan Southern Railroads, from Lake Erie to Chicago. The lake served as a connecting link till 1853, when, by the opening of the Cleveland and Toledo Railroad, a continuous line of 1000 miles of railway was formed between New York and Boston and Chicago.

The preceding sketch has traced the progress westward of the great trunk lines based upon Boston, New York, Philadelphia, and Baltimore. Some progress had been made, however, in the Valley of the Ohio, before either of these lines had reached that river or Lake Erie.

The first line of railroad undertaken in the great interior basin of the country was the Mad River and Lake Erie of Ohio, now a part of the Cincinnati, Sandusky, and Cleveland Railway. Its construction from Sandusky to Dayton, 154 miles, was begun in 1835, a portion of it being opened in 1838. In connection with the Little Miami, which was opened from Cincinnati to Springfield in 1846, it formed, in 1848, a part of the first through line opened from Lake Erie to the Ohio. A second line between the lakes and river was formed by the Little Miami and the Cleveland, Columbus, and Cincinnati, which was completed between Cleveland and Columbus, 135 miles, in 1851. The Cleveland and Pittsburgh, forming the third line, was opened in 1852. These roads opened up the greater part of the State of Ohio to transportation by railroads, and supplemented the trunk lines westward, so soon as the intermediate links could be put in. This was accomplished by the completion of the line of rail-

road from Buffalo to Toledo, the last link of which, between Cleveland and Toledo, was opened in 1853. Of the lines running east and west through that State the first to be constructed was the Central Ohio, which was opened from Wheeling to Columbus, 137 miles, in 1854. The Marietta and Cincinnati Railroad was begun in the spring of 1851, and six years later was completed from Marietta, on the Ohio River, to Loveland, 173 miles; entrance into Cincinnati, 6 miles beyond Loveland, being made over the tracks of the Little Miami Railroad. In 1857, the same year that the Marietta and Cincinnati was completed, the Baltimore and Ohio reached the Ohio River at Parkersburg by the construction of its Parkersburg branch, and two years later a branch of the Marietta and Cincinnati was built to meet the latter line, thus forming a through line from Baltimore and Washington to Cincinnati. In 1858 the Pittsburg, Fort Wayne, and Chicago Railroad Company opened its important line from Pittsburg to Chicago, a distance of 468 miles, completing the second great trunk line from New York to Chicago.

As in Ohio there were no railroads of importance constructed in the other Western States of the Union previous to 1849. In Indiana the Madison and Indianapolis (now a part of the Jeffersonville, Madison, and Indianapolis), one of the roads first constructed in the West, was opened in 1847. This line was originally begun by the State and 26 miles opened in 1841. It was transferred to a private corporation in 1843 and completed between Madison and Indianapolis in 1847. The first line running east and west through the State, made up of the Indiana Central and the Indianapolis and Terre Haute, was opened in 1853. The next line, having a similar direction, was the Ohio and Mississippi, opened in 1857. The New Albany and Salem, now the Louisville, New Albany, and Chicago, the first line connecting Lake Michigan and the Ohio, and lying wholly in Indiana, was opened in 1854.

In Illinois the first line undertaken was the Sangamon and Morgan, a portion of which was opened as a State work in 1839. This road now forms a part of the Wabash line. The second line opened in Illinois was the Galena and Chicago Union, which was commenced in 1849, and opened for a distance of 10 miles in June, 1850. The railway first opened in this State from Lake Michigan to the Mississippi River was the Chicago and Rock Island, in February, 1854. This connection marked a very important extension of the railway system of the country. The second line to the Mississippi, made up of the Galena and Chicago and the Illinois Central, was opened early in 1855. The Chicago and Alton was opened in 1855; the Chicago, Burlington, and Quincy to the Mississippi River in 1856; the Milwaukee and St. Paul in 1858; and the Western Union in 1862. Both of the latter now form part of the Chicago, Milwaukee, and St. Paul system. The Chicago branch of the Illinois Central was opened from Chicago to Cairo in 1856. At this time the Illinois Central, with its 700 miles of road, was considered the most stupendous undertaking in the world.

The next important extension westward was the Hannibal and St. Joseph, which carried the railway system to the Missouri River in 1859.

Of the lines constructed through Central and Southern Illinois the Terre Haute and Alton was opened in 1854 and the Ohio and Mississippi in 1857. From St. Louis, westward, the Pacific Railroad of Missouri, the beginning of the present Missouri Pacific system, was completed to Sedalia, 189 miles, in 1861—before the outbreak of the war.

The railroads whose progress has been here sketched formed at this date, geographically and commercially, one system, of which the Baltimore and Ohio Railroad and its connecting lines may be said to constitute the southern boundary or member. South of Baltimore there was no important commercial city upon the Atlantic coast, and the trade of all the interior north of

a line coincident with the lower Ohio naturally sought eastern outlets through the railways that had been opened. In consequence, the railroad development of the Southern States during the earlier periods was slow and of local importance only.

Several railroads were constructed at an early day in Virginia, the more important of which were those now forming the line traversing the State from North to South, and made up of the Richmond, Fredericksburg, and Potomac, completed from Richmond to Fredericksburg in 1837, and to the Potomac in 1841; the Richmond and Petersburg, opened in 1838; and the Petersburg and Roanoke, in 1843. But the great line of Virginia, prior to the civil war, was the railway traversing the State diagonally from Alexandria to the boundary line of Tennessee, 382 miles, made up of the Orange and Alexandria and the Virginia and Tennessee Railroads. The former of these roads was opened in 1859 and the latter in 1856. At the boundary it connected with East Tennessee and Virginia, extending to Knoxville, Tenn., which was opened in 1858. From Knoxville this line was extended to Dalton, on the line of the Western and Atlantic Railroad, by the East Tennessee and Georgia Railroad, opened in 1856.

From Weldon the Virginia system was extended to Wilmington, N. C., by the opening of the Wilmington and Weldon Railroad in 1840. It was not till 1853 that a connection was formed with the system of South Carolina by the opening of the Wilmington and Manchester Railroad. The South Carolina Railroad, as before remarked, was opened to Augusta, Ga., in 1833. From Augusta the Georgia Railroad was opened to Atlanta in 1839. The Central Railroad of that State was opened from Savannah to Macon in 1840. From Atlanta the railway systems of South Carolina and Georgia were extended to the Tennessee River at Chattanooga, Tenn., by the completion of the Western and Atlantic Railroad of Georgia, a State work, in 1850. From Atlanta a line of railway was opened to Montgomery, Ala., in 1853, and from Montgomery to Mobile, in the same State, in 1862.

From Chattanooga to Nashville the Nashville and Chattanooga was opened in 1854, and the Memphis and Charleston in 1857. The Mobile and Ohio Railroad was opened to Columbus, on the Mississippi River, near the mouth of the Ohio River, in 1859. The line from New Orleans, made up of the New Orleans, Jackson, and Great Northern, and the Mississippi Central, was opened to a connection with the Mobile and Ohio, at Jackson, Tenn., the same year. The Louisville and Nashville was opened to a connection with the roads last named in 1861, and with Nashville in 1859.

In the first period of 19 years there had been constructed in the United States, as already shown, 5996 miles of railroad, only 419 miles of which were in the Western States. In the second period, covering the 12 years from 1849 to 1860, there were added 24,639 miles of new railroad, making the total at the end of the latter year 30,635 miles, the increase over 1848 exceeding 400 per cent., and averaging annually over 2000 miles, as against an average of 316 in the experimental period.

The *third period* of the history of railroad construction was the first period of inactivity during the civil war. From 1861 to 1864 railroad construction was virtually suspended, the total additions during that time being only 3273 miles, of which 133 miles were in New England, 1235 in the Middle States, 1433 in the Western States, 143 in the Pacific States, and 329 in the Southern States.

Fourth Period.—The next period is that from 1865 (the close of the war) to the panic of 1873. In it the railroad mileage of the country expanded more than 100 per cent., increasing from 33,908 miles at the close of 1864 to 70,268 miles in 1873. This period covers what may be termed the Pacific Railroad era of the

United States. The railroads undertaken with the aid given by Congress were the most important of the period, or, more properly, the most important enterprises of the kind in the country's history. It was due to their undertaking that such an unprecedented stimulus was given to railroad construction; and the panic of 1873 resulted from the same cause as much as from any other special incident.

THE PACIFIC RAILROADS.

The project of a railroad to the Pacific Coast was first brought to the attention of Congress by Asa Whitney, of New York, in 1846 (antedating by two years the discovery of gold in California), in a memorial asking government aid for the building of a railroad from Lake Michigan to Portland, Oregon. It is a remarkable fact that this proposed route was substantially that followed by Lewis and Clarke's expedition to the Pacific, which was dispatched overland by Pres. Jefferson to examine and report upon the newly acquired Northwest Territory, shortly after the Louisiana Purchase in 1803, and that which was later practically adopted by the incorporators of the Northern Pacific Railroad Company. Whitney's proposition to Congress was for aid in the form of a grant of land on both sides of the proposed road. He asked no subsidy or pecuniary guarantees of any kind, relying upon his ability to dispose of the land to provide the means necessary for the successful prosecution of the work. His proposition was discussed in committee and in Congress, but his persistent efforts met with no reward beyond these respectful considerations.

Renewed interest was given to the scheme by the gold discoveries, yet all efforts to further the project were unavailing owing to the widespread prejudices of that time against granting his petition. For 2000 miles this proposed route lay through the public domain. According to a prevailing construction of the Constitution the nation was incapable of aiding such works or of even granting charters for their construction. Congress, however, yielded to the popular demands so far as to appoint commissions to survey other routes for national highways to the Pacific. The project continued to be a prominent subject of discussion until by 1860 public interest had been so thoroughly enlisted in it that both political parties at their national conventions in that year adopted resolutions in favor of granting government aid to an enterprise of this character. But the events immediately following the election of 1860 forbade the consideration at that time of any enterprise involving so large an outlay of money. The outbreak of the rebellion established emphatically the positive need of such a road as a war measure if for no other purpose. The Pacific Slope was loyal and the North, then in control of the government, determined to render that loyalty a matter of interest as well as sentiment.

On July 1, 1862, Congress passed an act chartering the Union Pacific Railroad Company, with authority to construct and operate a railroad and telegraph line from the Missouri River in the direction of San Francisco, or to a junction with the railroad of the Central Pacific of California, a company already chartered and organized under the laws of that State, and authorized by the same act to construct a railroad through the Territories of the United States, so as to form, in connection with the Union Pacific, a continuous line from the Missouri River to the Pacific Ocean. The route thus selected was one of those which had been surveyed by direction of Congress. The act provided for grants to both companies of right of way 200 feet wide, over the public domain; of alternate sections of land within 20 miles of the lines of the two roads; and of the bonds of the United States bearing interest at the rate of 6 per cent., payable in 30 years, and secured by a first mortgage on the roads, the bonds to be issued in ratio to the cost of construction of the several portions of the two lines; the amount finally issued being

\$27,236,512 to the Union, and \$27,855,680 to the Central Pacific. In consideration of these grants the two companies were to complete their roads by July 1, 1876; to transport troops, munitions of war, etc., for the United States at rates as favorable as those charged to individuals; to allow the use of its telegraph on similar terms; to pay into the treasury of the United States 5 per cent. of the net earnings of their respective roads, and allow the government to retain the whole of the charges for transportation on its account—the two sums so provided to be applied to the payment of the principal and interest as it accrued of the government bonds. At the maturity of these bonds the companies were to pay them, with such balance of interest as might then be due.

The act of 1862 did not secure its objects. The Union Pacific Company was organized as provided, but no one was to be found, as matters stood, to venture money in the construction of this road. Upon such representation, Congress, on July 2, 1864, amended the act of 1862, by making provisions more favorable to the companies, the chief of these being preference, by way of security, to an amount of bonds to be issued by both companies equal to those to be issued to them by the United States, and providing that the government should pay over to them one-half of the charges for services on its account. Under such provisions the two companies entered energetically upon the work of construction, and united their lines May 10, 1869, anticipating by more than seven years the time required by Congress therefor; the Union Pacific constructing 1034, and the Central Pacific, beginning at Sacramento, 743 miles.

The following statement shows the number of miles constructed annually by each company, and the total mileage for each year:

Years.	By Union Pacific.	By Central Pacific.	Total constructed.
1865.....	40	56	96
1866.....	265	38	303
1867.....	245	44	289
1868.....	350	362	712
1869.....	134	243	377
Totals...	1,034	743	1,777

The road of the Central Pacific was subsequently extended from Sacramento to San Francisco, a distance of 140 miles; the total length of line from the Missouri River to that city being 1917 miles; and from the harbor of New York, 3322 miles. Its general direction is almost exactly east and west, very nearly upon the parallel of 40°, or that of New York, Chicago, Salt Lake City, and San Francisco.

A connection with the eastern system of railroads had been provided in 1866 by the completion in that year of the second line of railroad between the Mississippi and Missouri Rivers, made up of the Chicago, Iowa, and Nebraska, and the Cedar Rapids and Missouri River Railroad, which completed the connection between Clinton, Iowa (the western terminus of the Galena and Chicago Union), and Council Bluffs, Iowa, opposite Omaha (the initial point in the Union Pacific line).

The Northern Pacific Railroad Company, whose line follows what is known as the Northern or 47th parallel route, was the second company chartered by Congress to build a transcontinental railroad. The charter was granted July 2, 1864, and the company was authorized to construct a railroad from Lake Superior to Puget Sound, a distance of about 1800 miles, with a branch from Puget Sound to the Oregon River, a distance of about 200 miles. By the act of incorporation the company was to receive the odd sections of government lands lying within forty miles of each side of the line of its road. With deductions for previous sales, water, Indian reservations, &c., &c., the grant, as estimated by the Land Department at Washington, equalled

47,000,000 acres, or 73,000 square miles—an area larger than the States of Ohio and Indiana, and equal to a belt of land 40 miles wide and 1850 miles long. The grant was conditioned upon the construction of the road within a period of 15 years, or by the 4th of July, 1879. Lands, however, in the ratio of the whole grant to the mileage, were to be certified to the company as fast as the construction progressed—that is, upon the completion of sections of 20 miles each.

By act of Congress, approved July 27, 1866, the Atlantic and Pacific Railroad Company was chartered to construct a railroad on the 35th parallel route from Springfield, Mo., to the Pacific Ocean, about 2000 miles, across the Indian Territory, Texas, New Mexico, Arizona, and California, as a main line, and from Van Buren, Ark., to the point where the main line strikes the Canadian River in the Indian Territory as a branch line. To this company Congress granted lands to the extent of 12,800 acres per mile of road in the States and 25,600 acres per mile of road in the Territories. The land grant to this road called for 42,000,000 acres, or about 70,000 square miles.

The next Pacific railroad chartered by Congress was the Texas Pacific Railroad Company, which was incorporated by act of March 3, 1871, and authorized to build from Marshall, Texas, to El Paso, thence through New Mexico and Arizona to a point on the Rio Colorado, at or near the south-western boundary of California, and thence to San Diego. This was the most southerly route of all lines chartered, and is known as the 32d parallel route. Its land grant was of the same proportion per mile as that of the Atlantic and Pacific—12,800 acres in the States and 25,600 acres in the Territories.

Upon none of these roads was any considerable progress made in building in the period now under consideration—that is, from the close of the war until the panic of 1873. A vigorous effort was made toward the extension and completion of the Northern Pacific, and in three and one-half years from the beginning of work, July, 1870, to the date of default on its interest payments, Jan. 1, 1874, there had been completed and opened for business 424 miles of road on the eastern end—from a point 23 miles west of Duluth westward to the Missouri River in Dakota—and on the western end 65 miles from Kalama to Tenino. The Atlantic and Pacific Railroad was able to complete only 125 miles of its line—from Springfield west—before the suspension of work, while on the Texas Pacific work had been only just begun.

In New England during this period railroad mileage increased nearly 2500 miles; in the Middle States the increase was 6070 miles, about 75 per cent.; in the South it increased 4000 miles (44 per cent.), and in the Pacific States the increase was from 166 miles to 2193 miles. But the great increase of this period was in the Western and South-western States, as is shown in the following statement:

At the close of 1873 the total capital investment in all the railroads of the United States was \$3,784,543,-034, represented by share capital to the amount of \$1,947,638,584, and bonded debts to the amount of \$1,836,904,450. This vast aggregate represented also the cost of the 70,651 miles of railroad then in operation, the average cost per mile for the whole country at that time equalling \$60,057. In New

England the average cost was \$47,850 per mile; in the Middle States, \$67,737 per mile; in the Western States, \$52,125 per mile; in the Southern States, \$36,994 per mile, and in the Pacific States, \$95,590 per mile. The maximum cost per mile was in New Jersey, where it averaged \$115,829; the minimum was in Florida, where the average was only \$18,445 per mile.

Table II. shows by groups of States, for 1873, the number of inhabitants to one mile of railroad; the number of square miles of territory to one mile of railroad; the amount of gross earnings of railroad per inhabitant and per mile of road; the percentage of gross earnings to cost; the percentage of net earnings to cost; and the percentage of dividend payments to capital stock.

The increase of mileage from 1871 to 1873 had been 21,623 miles, and the increase of the cost of the roads \$1,119,915,389. One cause for the excessive mileage built within a few years was the extraordinary effort to complete roads, in order to save from lapsing the vast grants made by Congress, on condition that the roads should be built within a certain time. But the increase was far beyond the possibility of speedy returns for the capital invested. That much land could be found unoccupied near the line of a railroad implied a sparse population, and although prairie soil could quickly be brought into cultivation, it would be long before there could be sufficient traffic to pay the interest on other cost of the roads. Excessive competition and speculation in railroad building and railroad bonds and stocks ensued until, in September, 1873, the great financial storm which has since passed into history as the "panic of 1873," burst upon the country. On the 20th of that month the New York Stock Exchange was closed by order of the Executive Committee, so great was the excitement, and was not opened again until the end of November. During the period of excessive speculation through which the country had passed, schemes of the most impossible or improbable kind had been freely floated, and it appeared as though the majority of people had virtually parted with all discretion.

Fifth Period.—After this fitful fever had culminated in the panic, the building of railroads fell off for two years, but in 1876 there was an evident recovery of tone. The second period of depression may be considered as lasting from 1873 to 1879. In 1873 the total mileage of lines constructed in the United States was 4097 miles. In the next year the total was only 2117 miles; in 1875 it fell off to 1711 miles; in 1876 there were built 2712 miles; in 1877, 2280, and in 1878, 2629 miles, the total during these five years being 11,449 miles, an average of only 2290 miles.

Sixth Period.—During 1879 matters began to improve throughout the country, and this feeling soon became reflected through the railroads. In that year construction increased nearly 100 per cent. over the preceding year.

The following statement shows the total mileage of railroads in operation at the close of each year from 1874 to 1887, with the annual increase in mileage:

Year.	Miles operated.	Increase.	Year.	Miles operated.	Increase.
1874.....	72,385	2,117	1881.....	103,145	9,796
1875.....	74,096	1,711	1882.....	114,713	11,568
1876.....	76,808	2,712	1883.....	121,454	6,741
1877.....	79,088	2,280	1884.....	125,379	3,825
1878.....	81,717	2,629	1885.....	128,987	3,608
1879.....	86,463	4,746	1886.....	137,986	9,000
1880.....	93,349	6,876	1887.....	149,913	11,927

During these 14 years there were built 79,645 miles of new railroad, an increase of over 112 per cent.; that is, in the last fourteen years we built 9400 miles of railroad more than we built in the preceding 44 years. The first five of these fourteen years comprised what we have termed the second period of depression; the

TABLE II.—*Ratios of Railroads and Railroad Earnings in 1873.*

Percentage of dividend payments to capital stock..	6.36	5.60	2.25	0.40	2.00	3.45

next four years were years of unexampled activity; while the three years of 1883, 1884, and 1885 were years of hesitancy, in which no new railroad enterprise of great magnitude was begun, as was natural after the completion in a single year (1882) of 11,568 miles of road. The last two years, 1886 and 1887, which close the record, are memorable for the reason that within that time there was constructed a greater extent of mileage than in any two preceding years. In 1886 there were built 8343 miles, and in 1887, 13,188 miles, the latter surpassing the record of any previous year. In the two years the new construction aggregated 21,531 miles.

Since the revival of railroad construction in 1879 there have been completed three additional through transcontinental railroads, the Northern Pacific, the Atlantic and Pacific, and the Southern Pacific, while the Union Pacific, by the construction of its Oregon Short line northwest to a connection with a branch of the Oregon Railway and Navigation Company's system, has added another route to the Pacific. At least three of the great western railroad systems are also stretching westward, with the evident intention of speedily reaching the same ocean.

A striking feature of the last decade of railroad building is the large number of speculative and parallel lines which were put under way and many of them completed, notably the West Shore Railroad, which parallels the New York Central line for its whole length from New York to Buffalo; the "Nickel-Plate" line, which parallels Lake Shore in like manner from Buffalo to Chicago, and the South Pennsylvania paralleling the Pennsylvania Railroad between Philadelphia and Pittsburg, upon which a vast sum was expended, but which has not been completed. In some instances such lines were perhaps undertaken with a view to forcing their subsequent purchase by the older companies whose lines they sought to parallel, and in the case of the two roads first mentioned these plans met with eminent success. But their fulfilment was in the main the cause of the depression which existed during the years 1885, 1886, and 1887.

Railroad construction in the United States practically dates from 1828, when the Baltimore and Ohio Railroad was commenced. In 1830 there were but twenty-three miles of railroad in the whole country. The wonderful growth of this element of modern civilization since that time is shown in Table I., which gives by States and groups of States, quinquennially from 1835 to 1885, and for the last two years, 1886 and 1887, the mileage of all railroads in the United States.

RAILROAD LEGISLATION.

The railroad lines first constructed were all built under special charters granted by their respective State Legislatures. As the ramifications of the system became more extended and its advantages became more thoroughly appreciated by the public, the public was only too eager to encourage its further extension in every way possible. To this end it was deemed advisable to remove all obstacles or legislation that tended to hinder or obstruct the more speedy formation and inauguration of new railroad enterprises. In this work the State of New York led

by enacting in 1850 a General Railroad Law which provided for the organization of railroad corporations at will by 25 or more persons, without application to the Legislature, the object sought to be attained being unrestricted competition in railroads, as well as to relieve the Legislature of much labor. This law served as a model for all similar laws introduced since then in the other States of the Union.

The State railroad commissions, which are to-day a recognized factor in railway administration, have come into existence and prominence since 1867, although there were so-called commissions at an earlier period.

In some of the New England States at an early period in the history of railroads such commissions were established. New Hampshire led in 1844 with a single head commission. Connecticut and Vermont followed with similar commissions, 1853 and 1855 respectively. The powers of these boards were very limited and for the most part advisory. New York had a short-lived commission in 1855, and after the civil war several were created for a temporary purpose, distinct from regulation, such as that in Arkansas, which passed upon applications for State aid to railroads, and that in Tennessee, in 1870, which was authorized to sell or lease railroads in default to the State for loans. There are marked differences in the plan upon which the existing State commissions are organized. Of the older ones, those of the New England States, with the exception of Massachusetts and New Hampshire, form a distinct class by themselves, their duties being mainly limited to the inspection of the railway equipment and service.

Of an entirely different type were the commissions of the Western States, which owed their origin to the widespread "granger" movement (1870-77). Of this movement, Prof. Arthur T. Hadley writes in his work on *Railroad Transportation*:

"Nowhere had the policy of railroad subsidies been more recklessly carried out than in the Upper Mississippi Valley. The spirit of enterprise at the close of the war found full play here. There was no lack either of national land-grants or municipal subscriptions. Each community wanted railroads at any price. Each railroad offered glowing inducements to settlers. The result was that railroads and settlers both moved too far west; and ran heavily into debt to do it.

"In the years 1865-71, five hundred million dollars had been invested in Western railroads. These roads were dependent upon the wheat crop for their revenue. The price of wheat, which for some years had been high, was at last affected by the extension of production and the change of conditions. With transportation charges at their previous figure, the farmers could no longer pay their debts. With transportation charges reduced, the railroads could not pay theirs. There was a loss to be divided, instead of a profit. It was beyond the power of any law to divide this loss in such a way as to give a profit to both parties. It was the result of general industrial conditions.

"Unfortunately the railroads were managed in such a way that it seemed as if they were directly responsible for pretty much all these evils. In the first place they were run recklessly, with a most short-sighted view to present interests only. Outrageous favors were given in the way of special rates. Where there was but one railroad it charged all that it could extort. When the farmer had once settled so far from any market, he was at the mercy of the railroad, which furnished his sole means of transportation.

"A state of feeling was developed through the community which only wanted organization to become all powerful. It found this organization in the Granges. (See GRANGERS.)

"That the movement against the railroads should come, was inevitable. That it took this particular instrument to make itself felt was in some sense an accident. When the first Granges were formed, the purposes of the organization were, first, to render farmers' homes attractive, and, second, to make farming more productive. As a means to this second end they sought to diminish the expenses; and one of the most important elements of expense was the cost of getting goods to market. It was thus that they became interested, as an organization, in questions of transportation and of railroad control. Their first utterances on this matter were moderate; it was but gradually that they became the instrument of popular agitation.

"The first tangible results were reached in Illinois. The constitutional convention of 1870 made an important declaration concerning State control of rates, on the basis of which a law was passed in 1871, establishing a system of maxima. This law was pronounced unconstitutional by Judge Lawrence. The result was that he immediately afterward failed of re-election, solely on this ground. The defeat of Judge Lawrence showed the true significance of the farmers' movement. They were concerned in securing what they felt to be their rights, and they were unwilling that any constitutional barriers should be made to defeat the popular will. They had reached the point where they regarded many of the forms of law as mere technicalities. They were dangerously near the point where revolutions begin.

"But they did not pass the point. The law of 1873 avoided the issue raised by Judge Lawrence against that of 1871. Instead of directly fixing maxima, it provided that rates must be reasonable, and then further provided for a commission to fix reasonable rates. Similar laws were passed by Iowa and Minnesota almost immediately afterward. The Legislature of Wisconsin went even farther, fixing by the so-called Potter Law the rates on different classes of roads at figures which proved quite unremunerative. The railroads made vain attempts to contest these regulations in the courts. They were defeated again and again, and finally, in 1877, the Supreme Court of the United States sustained the constitutionality of the Granger laws.

"But a more powerful force than the authority of the court was working against the Granger system of regulation. The laws of trade could not be violated with impunity. The effects were most sharply felt in Wisconsin. The law reducing railroad rates to the basis which competitive points enjoyed left nothing to pay fixed charges. In the second year of its operation no Wisconsin road paid a dividend; only four paid interest on their bonds. Railroad construction had come to a standstill. Even the facilities on existing roads could not be kept up. Foreign capital refused to invest in Wisconsin; the development of the State was sharply checked; the very men who had most favored the law found themselves heavy losers. These points were plain to every one. They formed the theme of the governor's message at the beginning of 1876. The very men who passed the law in 1874 hurriedly repealed it after two years' trial. In other States the laws either were repealed, as in Iowa, or were sparingly and cautiously enforced. By the time the Supreme Court published the Granger decisions, the fight had been settled, not by constitutional limitations but by industrial ones."

The first of the State commissions to attract public attention was that of Ohio, which was established in 1867, Gen. George B. Wright being the first incumbent of the office. Gen. Wright being a practical railroad man, his investigations and reports on matters of practical importance and public interest received considerable attention from all interested in the problem of governmental supervision or control of railroads.

The Massachusetts railroad commission was established in 1869, and furnishes the most conspicuous instance of the purely advisory commission, depending upon investigation, the justice of its conclusions, and the force of public opinion for the enforcement of its recommendations; and by reason of its successful working under a novel plan and of the ability of its membership it has always made its influence widely felt. Since its establishment its career has been closely watched, and its success is now undisputed. That it has not been due solely to fortuitous circumstances, or

to its application to a limited local field, is indicated by the fact that the principle upon which it was organized has been successfully applied in other States and has been followed by satisfactory results in the State of New York, with its concentration of great and diverse railroad and commercial interests.

The Illinois commission has been the leading exponent of the other theory of regulation through a commission. It was inaugurated by the adoption of the constitution of 1870, now in force, which declared railways to be public highways, and free to all persons for the transportation of their persons and property thereon, under such regulations as may be prescribed by law. The General Assembly is required to pass laws establishing reasonable maximum rates of charges for the transportation of passengers and freight; to correct abuses and prevent unjust discrimination and extortion; and to enforce such laws by adequate penalties to the extent, if necessary for that purpose, of forfeiture of the property and franchise of the railway. The consolidation of railroad companies owning parallel or competing lines is prohibited, and sixty days' public notice of all proposed consolidations is required.

The railroad legislation of the Southern States has in the main followed the general features of the Georgia system, which is similar to that of Illinois. The constitution gives the General Assembly power to regulate railroad freight and passenger tariffs, prevent unjust discriminations, and require reasonable rates, and it is made its duty to pass laws for these purposes and to enforce the same by adequate penalties. The General Assembly is prohibited from authorizing any corporation to buy shares or stock in any other corporation in the State or elsewhere, or to make any contract or agreement with any such corporation which may have the effect to defeat or lessen competition in their respective businesses, or to encourage monopoly; and all such contracts are declared illegal and void. Railroad companies are prohibited from giving or paying any rebate, or bonus in the nature thereof, directly or indirectly; or doing any act to deceive the public as to the real rates received. Such payments are declared illegal and void, and the General Assembly is required to enforce these prohibitions by suitable penalties.

California is the only State which has adopted the commission system as a part of the organic law of the State. The constitution of 1879 is extremely rigid in its provisions for the regulation of railroads. It declares all railroad, canal, and transportation companies common carriers and subject to legislative control, and requires railroads to receive and transport each other's passengers, tonnage, and cars without delay and discrimination.

The following statement shows the States having commissions and the year in which commissions were first established in each State, arranged in the order of their establishment:

State.	Date.	State.	Date.
New Hampshire.....	1844	Virginia	1876
Connecticut.....	1853	Iowa	1878
Vermont.....	1855	South Carolina.....	1878
Maine.....	1858	Georgia.....	1879
Ohio.....	1867	Kentucky	1880
Massachusetts	1869	Alabama	1881
Illinois.....	1871	New York	1882
Rhode Island	1872	Kansas	1883
Michigan	1873	Mississippi	1884
Wisconsin.....	1874	Nebraska.....	1885
Minnesota.....	1874	Colorado	1885
Missouri.....	1875	Dakota.....	1885
California	1876		

Interstate Commerce Commission.--This commission, the first tribunal organized in connection with the National government, and clothed with advisory and other powers to regulate the traffic of railroads, began its official labors April 5, 1887. The assumption of

these powers by the National government had been zealously advocated for many years by a large and influential class of citizens who held that under the provision of the Constitution investing Congress with power to regulate the commerce between the States, Congress possessed the right to regulate the traffic of railroads, or other agencies of transportation, between the States. This proposition was, however, strenuously opposed by those who held contrary views as to the proper functions of the National government.

As far back as December, 1872, the Senate of the United States, upon the recommendation contained in Pres. Grant's message, appointed a committee to consider the question of transportation routes to the seaboard and to report to Congress with a view to "its better guidance in legislating on this important subject." In the preamble to the resolution authorizing the appointment of this committee it was recited that "the productions of our country have increased much more rapidly than the means of transportation, and the growth of population and products will in the near future demand additional facilities, and cheaper ones, to reach tide-water." The committee began its investigation in September, 1873, and pursued its inquiries in various parts of the country until the close of the year. A great mass of testimony was elicited upon all subjects examined, particularly those affecting the question of railroad transportation; but nothing tangible resulted from its deliberations or conclusions, at least so far as concerned the assumption of any controlling powers by Congress. The question of Congressional regulations of interstate commerce, however, continued to be discussed and agitated with more or less vigor, particularly during the three years immediately preceding the final passage of the Interstate Commerce Act.

As a result of the active interest that was being exhibited throughout the country upon this subject, particularly in the West, the U. S. Senate in March, 1885, appointed a committee "to investigate and report upon the subject of the regulation of the transportation by railroad and water routes in connection or in competition with said railroads of freights and passengers between the several States." From its chairman, Senator Shelby M. Cullom, of Illinois, the committee became popularly known as the Cullom Committee; and the bill presented by it subsequent to its extended investigations is known as the Cullom Interstate Commerce Bill. This bill was reported from a conference committee of both Houses Dec. 15, 1886, and was passed and became operative April 5, 1887. A brief synopsis of the bill is appended: By section 1 the railroads and other transportation companies are

required to have just and reasonable rates; section 2 forbids discriminations by special rates, rebates, drawbacks, etc.; section 3 forbids undue preferences to individuals or localities, and requires that carriers shall provide facilities for interchange of traffic; section 4 requires a uniform rate for all distances, but in special cases the commission may suspend this rule; section 5 forbids pooling of freights and division of earnings between carriers; section 6 requires schedules of rates, charges, and fares to be printed and copies kept at every station for public use, and forbids any increase in the rates so published without due notice; section 7 forbids acts interfering with and contracts preventive of continuous carriage of freight; section 8 makes the common carrier liable to the person injured for any damages sustained through any act done or permitted by the carrier contrary to this law; section 9 gives the person damaged the right to make complaint to the commission or to bring action in his own behalf, but forbids him the right to pursue both remedies, and in any such action brought the court is empowered to compel officers of companies to attend, testify, and produce books and papers; section 10 imposes a penalty for disobedience or infraction of the act; section 11 creates the Interstate Commerce Commission, and makes rules for its guidance; section 12 authorizes the commission to inquire into the management of the business of all common carriers, and to require attendance of witnesses and production of books, contracts, and documents relating to any matter under investigation; section 13 and those following make provision for the investigation of complaints, etc.

Pres. Cleveland appointed a commission of the highest character, Hon. Thomas M. Cooley, who had been chief-justice of Michigan, being chairman. The commission entered upon its important duties in a cautious and judicial spirit, which has been highly approved by all parties concerned in the questions submitted to it. Its labors have proved highly beneficial to the country, and will undoubtedly result in wise regulations, both by the National and State governments and by the railroad companies themselves.

The chief aim of the commission has been to secure on behalf of the people fixed and uniform charges for railroad service. The railroad corporations now admit that their own interest, and the interest of all who have invested in this species of property, will be subserved by effecting this.

RAILROAD OPERATION AND EARNINGS.

1880.....	147,653,003	467,748,928	613,733,610	341,302,945	272,430,665	107,866,328	77,115,371
1876.....	136,120,583	361,137,376	493,233,529	308,075,099	185,158,430	93,559,573	68,039,668

enue train mileage, passenger and freight traffic, and gross traffic earnings of all the railroads in the United States for six years, 1882-87, inclusive.

Tables V. and VI. show the length, capitalization, debt and cost of the railroads of the United States at the close of recent years; the average length of same operated during such years, and the earnings, expenses, interest and dividend payments thereof.

An examination of the statistics of capitalization and debt (see Table V.) shows the following averages per mile of railroad for the past six years:

Year.	Capital stock per mile.	Bonded debt per mile.	Cost of road per mile.
1887.....	\$28,321	\$28,290	\$52,699
1886.....	29,925	29,062	54,301
1885.....	29,867	29,453	55,059
1884.....	30,064	29,317	55,329
1883.....	30,759	28,650	55,461
1882.....	30,674	28,268	52,726

The steady decrease in the average cost of road and equipment per mile during the past five years is the most striking feature of this table. It is due largely to the fact that the new lines of railroad built within that period for the most part run through sections of the country which present no extraordinary engineering difficulties; and in no small degree to the wonderful improvements that have been made in the manner of constructing railroads—the great speed secured by the massing of veritable armies of workmen at various points of the road, and the extraordinary reduction in the cost of the chief articles that enter into the construction of such work.

A comparison of these statistics by the eight groups into which the country has been divided shows the following relative averages for 1887:

Groups.	Capital stock per mile.	Bonded debt per mile.	Cost of road per mile.
New England.....	\$33,801	\$20,931	\$52,613
Middle Atlantic.....	57,982	57,451	97,043
Central Northern.....	23,688	24,868	46,536
South Atlantic.....	19,888	19,911	36,014
South Central.....	23,739	27,640	48,809
South-western.....	23,470	22,594	43,429
North-western.....	22,368	25,485	48,125
Pacific.....	30,443	26,881	61,054

The following statement shows the relative earning capacity of the railroads in the several groups during 1887:

Groups.	Passenger earnings per mile.	Freight earnings per mile.	Gross earnings per mile.	Net earnings per mile.
New England.....	\$4,168	\$4,801	\$9,495	\$2,758
Middle Atlantic.....	3,373	9,696	13,560	5,067
Central Northern.....	1,563	4,509	6,479	2,284
South Atlantic.....	937	2,431	3,740	1,163
South Central.....	1,247	3,710	5,274	1,817
South-western.....	1,135	3,363	4,873	1,676
North-western.....	1,079	3,320	4,720	1,844
Pacific.....	1,699	3,820	6,205	2,455
Whole U. S., 1887.....	\$1,756	\$4,649	\$6,861	\$2,444
United States, 1886....	1,693	4,397	6,570	2,376
" " 1885.....	1,612	4,219	6,265	2,185

During the past six years the relation of passenger earnings to freight earnings in the whole country has varied but slightly; passenger earnings usually averaging about 26 per cent. of gross earnings, while freight earnings have averaged about 67 per cent. Comparing the groups, however, wide differences are shown. In New England passenger and freight approach nearest to equality, the former being 43.89 per cent. of the gross, and the latter 50.56 per cent. The greatest disparity is in the North-western States and in the Middle States, the proportion for passenger earnings in the former case being 22.86 per cent. of gross as against 70.33 per cent. for freight earnings, while in the Middle States the respective percentages of passenger and freight earnings were 25.18 and 72.36. The following statement shows the relative proportions of passenger, of freight, and of miscellaneous earnings to gross traffic earnings in the several groups of the United States in 1887:

Groups.	Passenger earnings. Per cent.	Freight earnings. Per cent.	Other earnings. Per cent.
New England.....	43.89	50.56	5.55
Middle Atlantic.....	25.18	72.36	2.46
Central Northern.....	24.12	69.59	6.29
South Atlantic.....	25.06	65.01	9.93
South Central.....	23.65	70.34	6.01
South-western.....	23.29	69.02	7.69
North-western.....	22.86	70.83	6.81
Pacific.....	27.38	61.56	11.06
United States.....	25.82	68.38	5.80

In this connection the following statement of passenger traffic in the several groups of the country for 1887 and of the whole United States for the years 1883 to 1887 is instructive:

Groups.	Number of passen- gers carried.	Number car- ried one mile.
New England.....	93,483,949	1,482,312,733
Middle Atlantic.....	176,361,731	3,059,957,868
Central Northern.....	87,292,882	3,027,621,204
South Atlantic.....	11,315,150	396,245,486
South Central.....	11,379,600	438,688,840
South-western.....	18,421,275	923,887,906
North-western.....	13,502,021	614,419,651
Pacific.....	16,468,905	627,173,022
United States, 1887....	428,225,513	10,570,306,710
" " 1886....	382,284,972	9,659,698,294
" " 1885....	351,427,688	9,133,673,956
" " 1884....	334,570,766	8,778,581,061
" " 1883....	312,636,641	8,541,309,674

An examination and comparison of these figures show that in New England the average distance travelled by each passenger was less than in any other group, while the longest trips were made in the South-western States. In like manner the rates of fare averaged lowest in New England and highest in the South-west. This can be best illustrated by the following tabular statement showing the average distance travelled per passenger and the average rate of fare per mile for same in each group in 1887:

Groups.	Average distance per passenger.	Average rate per passenger per mile.
New England.....	15.85 miles.	1.964 cents.
Middle Atlantic.....	17.35 "	2.092 "
Central Northern.....	34.68 "	2.274 "
South Atlantic.....	35.01 "	2.777 "
South Central.....	38.55 "	2.421 "
South-western.....	50.15 "	2.824 "
North-western.....	45.50 "	2.692 "
Pacific.....	38.08 "	2.277 "

In the whole United States the average distance per passenger was 24.68 miles, and the average rate of fare per mile 2.276 cents. The tendency throughout the country in both these respects is toward decreases in the length of the average trip and in the rates charged. No better evidence of the constant and rapid growth of the country can be furnished than the statistics of the passenger traffic of its railroads. By the table of passenger traffic given above it is shown that within the short space of five years, from 1883 to 1887, the number of passengers using the railroads of the United States (excluding all elevated

and surface city roads) increased 115,538,872, or from 312,686,641 to 428,225,513. The rate of increase within this period of five years was 37 per cent. If an increase of 33½ per cent. in every five years were to be maintained for fifteen years longer we would have in 1902 a passenger traffic of more than 1,014,000,000 persons. The following statement shows the steady decline in the average rate of fare per mile in every year from 1882 to 1887 (except the latter year, in which a slight advance was recorded), and the corresponding decreases in the average distance per passenger per mile:

Years.	Average rate per passenger per mile.	Average distance per passenger.
1882.....	2.514 cents.	28.89 miles.
1883.....	2.422 "	27.32 "
1884.....	2.356 "	26.24 "
1885.....	2.198 "	25.99 "
1886.....	2.181 "	25.27 "
1887.....	2.276 "	24.68 "

The constant decrease in average distance is due to the increase in the number of passengers carried, which as a country becomes developed will inevitably reduce the average length of trip for all passengers.

While the country has been undergoing the wonderful and unprecedented material development witnessed in the past twenty-two years, the inventive genius of the country has been engaged in bringing to perfection the details of railroad construction. The result is shown in the solidity of railroad superstructure of to-day, its massive bridges and viaducts, its wonderful tunnels and other great works built to overcome nature's obstructions, in the improved cars and engines of to-day, and the consequent increase of comfort in railroad travel. It was to be expected, with all those forces operating simultaneously, that there would be a steady increase of use of the improved facilities, but the results have surpassed anticipations.

Table VII. shows the number of tons of freight moved each year, the earnings therefrom, the aggregate tonnage-mileage, and the average rate per ton per mile for all roads, yearly, from 1865 to 1887, inclusive, on the Illinois Central, the Chicago and Alton, the Chicago and Rock Island, the Chicago, Burlington, and Quincy, the Chicago and North-western, the Chicago, Milwaukee, and St. Paul Railroads, with the aggregate tons moved annually on the same:

TABLE VII.—Freight Business of Six Principal Western Railroads since 1865.

Year.	Aggregate tonnage moved.	Aggregate of earnings.	Aggregate for each year.	Rate charge per ton per mile.
	Tons.	Dollars.	Tons-Miles.	Cents.
1865.....	4,032,166	18,703,805	513,421,459	3.642

During the six years in which full statistics of passenger and freight traffic of all the railroads in the United States have been compiled the increase in freight business has kept pace and in some years has largely exceeded the increase in passenger movement.

In the following statement the statistics of freight tonnage, tonnage mileage (tons carried one mile), average haul per ton, and average rates received per ton per mile on all the railroads of the United States are shown for the six years from 1882 to 1887 inclusive:

TABLE XII.—*Freight Movement.*

Years.	Freight moved.	Freight movement.	Average haul per ton.	Average rate per ton per mile.
	Tons.	Miles.	Miles.	Cents.
1882.....	360,490,375	39,302,209,249	109.02	1.236
1883.....	400,453,439	44,064,923,445	110.04	1.236
1884.....	399,074,749	44,725,207,677	112.07	1.124
1885.....	437,040,099	49,151,894,469	112.46	1.057
1886.....	482,245,254	52,802,070,529	109.49	1.042
1887.....	552,074,752	62,061,069,996	108.79	1.063

As these figures show there was an increase in number of tons of freight moved in 1887 over 1882 of 191,584,377 or 53.14 per cent., against an increase in number of passengers carried of 139,194,730 or 48.16 per cent. In the aggregate movement of each the following showing is made: Number of passengers carried one mile in 1882, 7,483,059,934; in 1887, 10,570,306,710; increase, 3,087,246,776, or 41.25 per cent. Number of tons of freight moved one mile in 1882, 39,302,209,249; in 1887, 62,061,069,996; increase, 22,758,860,747 tons or 57.90 per cent.

These enormous increases were directly the result of the rapid extension of the railroad system of the country which opened up to settlement and commerce infertile tracts of land whose products were previously comparatively valueless through their inaccessibility to the markets of the country.

The remarkably rapid and steady decline of freight rates is shown in Table XII., and more fully in VII. and VIII. The last two show that east of Chicago freight rates have declined from 2.9 cents per ton per mile in 1865 to 0.718 cent in 1887; while west of Chicago the decline has been from 3.642 cents in 1865 to 1.014 cents in 1887. Unquestionably these results could not have been attained otherwise than by the many improvements in construction methods already mentioned.

Rails.—One of the most important items that enters into the cost of a railroad is the rails used. The style of rails used on the first lines built in the country have already been described and reference has been made already to the gradual substitution of heavy rails, which, after 1850, came into general use. The first T rails rolled in this country were rolled in October, 1845, at the Montour rolling-mill, Danville, Pa., which was built in that year. The invention of the Bessemer steel process dates from 1855. The first steel rails used in this country were imported from England by the Pennsylvania Railroad. The first experimental rails rolled in this country were made at the North Chicago rolling-mill from steel made at Wyandotte, Mich., on May 24, 1865. It was not until August, 1867, that the making of Bessemer rails was fairly established in this country. In that year there were produced 2550 tons of steel rails. The superiority of steel rails over iron rails was speedily established, but for a long time their general adoption was retarded by the great cost of their manufacture. But within the past fifteen years the price has fallen from \$120 to \$30, and the result is shown in the rapid substitution of steel rails for iron as set forth in Table VIII. The production each year from 1867 to 1887, inclusive, is shown in the following statement:

Years.	Tons.	Years.	Tons.
1867.....	2,550	1870.....	34,000
1868.....	7,225	1871.....	38,250
1869.....	9,650	1872.....	94,070

Years.	Tons.	Years.	Tons.
1873.....	129,015	1881.....	1,355,519
1874.....	144,824	1882.....	1,460,920
1875.....	290,863	1883.....	1,295,746
1876.....	412,461	1884.....	1,119,291
1877.....	432,169	1885.....	1,079,400
1878.....	559,795	1886.....	1,768,920
1879.....	693,113	1887.....	2,396,397
1880.....	960,075		

Total tons of rails, 14,697,171.

An interesting and instructive record of the comparative productiveness as investments of the share capital and bonded indebtedness of American railroads is presented in the edition of *Poor's Manual of Railroads* for 1888. It shows the average rate per cent. of all dividend and interest payments during the past six years upon the aggregate capital stocks and bonded debts of the railroads, and is arrived at by dividing the total amount of stocks and bonds at the end of each year into the total amount of dividends and interest paid within that year. It is embodied in the following statement of percentages:

Years.	On bonds.	On debt.	General
	(inc. bonds).	(inc. bonds).	Dividends. Average.
1887.....	4.71	4.55	2.18 3.40
1886.....	4.75	4.53	2.04 3.26
1885.....	4.77	4.62	2.02 3.36
1884.....	4.66	4.51	2.48 3.52
1883.....	4.59	2.75 3.68
1882.....	4.40	2.91 3.65

These averages show clearly the fluctuating prosperity of railroads. In view of this showing for the past six years it is fair to assume that from the close of the civil war to the present time the average return on bonds per annum has been 5 per cent. and on stocks fully 3 per cent.

Poor's Manual of Railroads for 1888 gives also an interesting comparison of the respective productiveness in the two years 1882 and 1886 of American railroad stocks and bonds. It shows that in 1882 on a total capital stock of \$3,478,961,246, dividends aggregating \$101,967,560 were paid, the average rate of which per annum equalled 2.93 per cent. of the total, while on the remaining \$1,805,170,387, or 51.89 per cent. of the total, no dividends were paid. Upon this basis the average rate of dividends paid in 1882 upon productive stocks was 6.10 per cent.

In 1886 the showing is not quite so encouraging; for while the total amount of share capital increased \$522,403,252, the amount of productive capital increased less than \$2,000,000, or to \$1,675,669,744 (41.88 per cent. of the total), while unproductive capital increased more than \$520,000,000, rising to \$2,325,694,754, or 58.12 per cent. of the total. For this reason the total amount paid in dividends averaged in 1886 only 2 per cent. on the total amount of capital outstanding and 4.78 per cent. on the productive capital.

(J. P. M.)

RALE, SEBASTIAN (1657-1724), Jesuit missionary, was born in Franche-Comté, and entered the Jesuit order at an early age. After holding a professorship at Nîmes he was sent to Canada in 1689, and stationed first among the Abenakis. In 1692 he set out for Illinois, but spent the winter at Mackinac on the way. In 1694 he returned to the Abenakis and henceforth had his residence at Norridgewock, on the Kennebec. When the Indians resumed hostilities against the New England settlers, the latter blamed Rale for inciting them and set a price on his head. In 1705 they attacked Norridgewock and burnt the church; in 1722 they plundered the village, and in 1724 they again attacked it, and killed Rale at the foot of the cross. The *Dictionary of the Abenaki Language*, which he had compiled, was preserved in Harvard College and published by Dr. John Pickering in 1833. In the same year a monument to Rale's memory was erected at Norridgewock.

RALEIGH, the capital of North Carolina, and county-seat of Wake co., is on the Neuse River, in 35° 47' N. lat. and 78° 48' W. long., and 133 miles N. N. W. of Wilmington. It has now three railroads. At its centre is Union square, containing the handsome granite State-house, which cost over \$500,000. From the square radiate the four principal streets, each 99 feet wide. The other State buildings are institutions for the deaf and dumb, the blind and the insane, the penitentiary, a geological museum, and the governor's residence; there are also a U. S. government building, a county court-house, a normal school and other schools. Raleigh has iron-foundries, car-shops, machine-shops, and manufactories of agricultural implements, carriages, and clothing. It was settled in 1792, and in 1880 had 9265 inhabitants.

RALSTON, WILLIAM RALSTON SHEDDEN, an English writer and lecturer on Russian subjects, was born in 1828, and was educated at Trinity College, Cambridge, graduating in 1850. In 1853 he was appointed assistant librarian in the British Museum, and continued there until 1875. His publications include *Kriloff and His Fables* (1869); *Songs of the Russian People* (1872); *Russian Folk Tales* (1873); *Early History of Russia* (1874).

RAMBAUD, ALFRED NICOLAS, a French historian, was born at Besançon, July 2, 1842. He was educated at the Upper Normal School, graduating in 1864, and receiving the degree of doctor of letters in 1870. He had spent some time in Russia in literary pursuits. In 1871 he was made professor of history at Caen, in 1875 at Nancy, and in 1879 was called by Jules Ferry, then minister of public instruction, to be his secretary. In 1882 Rambaud became professor of history at Paris. His principal works are *La Domination française en Allemagne, 1793-1804* (1873); *L'Allemagne sous Napoléon I., 1804-11* (1874); *La Russie épique* (1876), a study of the songs of Russia; and *Histoire de la Russie* (1878). The last two, written in a popular style, are excellent presentations of Russian thought and history, and have been translated into English.

RAMSAY, SIR ANDREW CROMBIE, Scotch geologist, was born in 1814, and educated at Glasgow University. He was appointed on the Geological Survey of Great Britain in 1841, and was made Director of it in 1845. He was appointed professor of geology at University College in 1848, and lecturer on geology in the Royal School of Mines in 1851. He became a member of the Royal Society in 1849, and received various marks of honor from universities and learned societies, American as well as European. In 1872 he was made director-general of the Geological Survey of the United Kingdom. He was president of the British Association in 1880. In the next year when he retired from his public offices the value of his services was acknowledged by granting him the honor of knighthood. Among his publications have been *Geology of Arran*; *Geology of North Wales* (1858); *Old Glaciers*

of North Wales and Switzerland (1860); *Physical Geology and Geography of Great Britain* (1878).

RAMSAY, EDWARD BANNERMAN (1793-1872), a Scotch clergyman, commonly known as Dean Ramsay, was born at Balma, in Kincardineshire, Jan. 31, 1793. He graduated at St. John's College, Cambridge, and was ordained in the Church of England. After holding a curacy in Somersetshire for some years, he became minister of St. John's Church, Edinburgh, and in 1841 was made dean. Already noted in the Scottish capital for his genial conversation and benevolent character, he gained in his old age wider appreciation by his *Reminiscences of Scottish Life and Character* (2 series, 1857-61). He also published *Diversities of Christian Character* (1858); *The Christian Life* (1859); *Pulpit Table-Talk* (1868); and a *Memoir of Dr. Thomas Chalmers* (1867).

RAMIE. See FIBRE.

RANDALL, SAMUEL JACKSON, Democratic leader, was born at Philadelphia, Oct. 10, 1828. He received an academic education and engaged in business in his native city. For four years he was a member of the city councils, and in 1858 was elected to the Pennsylvania State Senate. In 1862 he was elected to Congress as a Democrat, and he has served continuously since that time, being sometimes elected without opposition. When in 1875 the Democratic party for the first time after the civil war obtained a majority in the House of Representatives, Michael C. Kerr was chosen speaker, and on his death in 1876 Mr. Randall became his successor. As such he used his influence in guiding the House through the dangerous crisis produced by the uncertainty of the Presidential election in that year. He favored the formation of an electoral commission to decide the points in dispute, and was successful in having its judgment accepted by the House. His ability as Speaker gave him prominence also as a candidate for the Democratic nomination to the Presidency in more than one National Convention. He continued to be Speaker until 1881, when the House passed again under the control of the Republicans. Financial questions have always received his especial attention. In 1883 the Democrats were again in power, but they chose Mr. John G. Carlisle speaker. The change of leaders indicated the progress of the party in the direction of tariff reduction. Mr. Randall has always advocated a tariff for revenue with incidental protection. Mr. Carlisle represents the tendency towards a tariff for revenue only. Mr. Randall's ability as a leader was still acknowledged so far that he was made chairman of the important committee on appropriations. In the closing hours of the 48th Congress, on March 4, 1885, his force of character and parliamentary skill enabled him to secure the placing of Gen. U. S. Grant's name on the retired list of the army. In the summer of 1888 he performed a similar act in having the rank of general restored in order that the dying soldier, P. H. Sheridan, might be promoted to it. After Pres. Cleveland's election, towards which Mr. Randall had contributed, he seemed to have the favor of the administration. When the increasing surplus in the U. S. treasury demanded legislative action he prepared a bill for moderate reduction in the tariff, and the removal to a great extent of the internal revenue system. Mr. Cleveland, however, steadily urged his party toward the single object of tariff reduction, and Mr. Randall became isolated. The number of Protection Democrats in the House was reduced to a handful, and Mr. Randall was silenced in the party councils. Worn out with labor, he was attacked with sudden illness in August, 1888, and compelled to retire to recruit his strength. Yet such was his hold on his own district that amid the heat of a Presidential campaign there was no opposition from either party to his re-election. (J. P. L.)

RANDOLPH. Of the Virginians of this name the most famous, John Randolph of Roanoke (1773-1833), is sketched in the *ENCYCLOPÆDIA BRITANNICA*.

PEYTON RANDOLPH (1723-1775) graduated at William and Mary College, and having studied law at the Temple, London, was made king's attorney-general in 1748. His sympathies were with the people during the conflict which soon arose with the British government. In the House of Burgesses in 1764 he drew up the address in opposition to the Stamp Act. When elected speaker of the House he resigned the office he held from the king, lest it should interfere with his duty to the people. But his brother John (1728-1784) was of a different mind and readily accepted the place. Peyton was chairman of the patriots' committee of correspondence in 1773, and when the first Continental Congress assembled in Philadelphia in September, 1774, was chosen its president. In every movement in Virginia for the rights of the people he was foremost. While attending Congress in Philadelphia, he died of apoplexy, Oct. 22, 1775.

His nephew, **EDMUND RANDOLPH** (1753-1813), suffered for his patriotism by being disinherited by his loyalist father, who suffered in turn for his loyalty by being compelled to seek refuge in England. Edmund, however, succeeded his father as attorney-general, was delegate to Congress, 1779-82, and governor of Virginia, 1786-88. While holding this office he took part in framing the Constitution of the United States, though the draft which he had originally prepared was not accepted by the convention. (See CONSTITUTION OF THE UNITED STATES.) He refused to sign the Constitution when completed, but urged its ratification in the Virginia Convention. He had been one of Washington's aides during the Revolutionary war, and in 1789 was appointed by him attorney-general of the United States. When Jefferson retired from the cabinet in 1794, Randolph, who had also countenanced Genet's projects, was appointed secretary of state, but in the next year he was compelled to retire in consequence of charges based on a letter from the French minister Fauchet, which was intercepted, translated, and published by the British. Randolph's *Vindication* (1795) did not suffice to restore his reputation. He died in Frederick county, Va., Sept. 12, 1813. Wirt in his *British Spy* gives a sketch of his person and services, and Moncure D. Conway, in his *Omitted Chapters of History Disclosed in the Life and Papers of Edmund Randolph* (1888), makes a strong effort to retrieve and restore his reputation. In this work the original of Fauchet's letter was published for the first time.

THOMAS MANN RANDOLPH (1770-1828) was a son-in-law of Pres. Jefferson, served in Congress during his administration, and was colonel in the war of 1812-15. In 1819 he was elected governor of Virginia. He died at Monticello, June 20, 1828.

His son, **GEORGE WYTHE RANDOLPH** (1820-1867), was educated at the University of Virginia and entered the U. S. navy, but was afterwards a lawyer at Richmond. He was a brigadier-general in the Confederate army, and in March, 1862, was made secretary of war in the Confederate government. In 1863 he went to France as agent of the treasury. After the war he returned and died in Albemarle co., Va., April 4, 1867.

RANGABE, ALEXANDER RIZOS, a Greek poet and statesman, was born at Constantinople in 1810, of a distinguished Fanariote family. His father was noted as a poet and had translated into modern Greek the *Æneid* and some French dramas, and also published an able work on the geography and history of Greece. The son was educated in the military school at Munich and at the end of 1829 went to Greece, where he served in the artillery. In 1832 he was appointed to a position in the department of public instruction. In 1840 he was made director of the royal press and in 1842 he was employed in the department of the interior. In 1845 he was made professor of archaeology in the University of Athens, and founded and edited some literary and political journals. He was minister

of foreign affairs, 1855-59, and in 1867 he was sent as ambassador to the United States. Afterwards he was minister to France, Turkey, and finally Germany. As a representative of the Greek government he attended the Berlin Congress in 1878. Besides lyrical poems he has published a number of dramas relating to various epochs of Greek history, and translations from the ancient tragedians and Plutarch, as well as from Dante, Goethe, Shakespeare, and other modern writers. He has also published in French a *History of Modern Greek Literature* (1877).

RANKE, LEOPOLD VON (1795-1886), the distinguished German historian, was born Dec. 21, 1795, at Wiehe, in Prussian Saxony. He received his university training at Leipsic, where he studied Thucydides under Hermann and was attracted by the labors of Niebuhr and Savigny. In 1818 he became an instructor in the gymnasium at Frankfort, and in 1825 he was called to the University of Berlin as professor extraordinary of history. He was raised to the professorship in 1834. He had already entered the wider field in which he won enduring fame, and had published one volume of a *History of the Romance and German Nations* (1824). He declared his design to show the fundamental unity of modern European civilization, while yet tracing the mixture of the Romance and German elements. This volume covered the period of the Italian wars from 1494 to 1535. His original plan was then so far modified that the histories of the different states were treated independently. In an appendix to his first volume he had given a critical estimate of the authorities for the period, and had pointed out the importance of careful examination of diplomatic documents. The thorough sifting of statements previously accepted and the elucidation of what had remained obscure were the features of the new method to which he remained faithful through life. The government of Prussia gave him aid in carrying out his views and authorized him to make researches in Vienna, Venice, Florence, and Rome. The first instalment of his new series appeared in 1827, giving the history of the Turks and Spain in the sixteenth and seventeenth centuries. His attention to the main work was varied with monographs on Servian and Venetian history and lectures on Italian poetry. For a few years Ranke was associated with Savigny in editing a historical magazine, but from 1836 he devoted himself to original work. His labors on the history of the papacy, *Die Römische Papste; ihre Kirche und ihr Staat* (3 vols., 1834-37), gave him fame not merely in Germany but throughout Europe. Though not his best work it has been most widely circulated. It reached its eighth edition in 1885, and had in the meantime been translated into English by Miss Austin (1840) and into other languages. Its effect was to reveal to Protestant Christendom the true character and extent of what Ranke named the Counter-Reformation. This effect is graphically presented in Macaulay's admirable review.

In his subsequent works the historian turned from the South of Europe, dominated by Catholicism, to the North, where the Reformation had prevailed. His work here was even more important, though less widely appreciated. First came Germany, treated in his *Deutsche Geschichte im Zeitalter der Reformation* (6 vols., 1839-47), and then more particularly Prussia in the *Preussische Geschichte* (3 vols., 1847-48; subsequently enlarged, 1871-74). Ranke had been appointed historiographer of Prussia in 1841, and he amply repaid the favor which he had ever received from its royal family. Still pursuing his plan of giving elaborate histories of the several European states, he next published the history of France (5 vols., 1852-61), and that of England (6 vols., 1859-67; afterwards extended to 9 vols., 1877-79). He was allowed to retire from duty as professor in 1871, and immediately set about a thorough revision of his works, a collected edition of which had already appeared in 48 vol-

umes (1867). But the learned and vigorous old man was not content with this recast of modern history; at the age of eighty he boldly essayed to tell in his own thoroughly scientific way the history of the world from the dawn of civilization. He lived to complete twelve volumes of his *Weltgeschichte*, bringing the narrative down to the Middle Ages. This wonderful work shows no diminution of his intellectual force.

The celebration of various events in academic career gave opportunity for the government and others to bestow on him marks of honor. In March, 1865, he was raised to knighthood; in September, 1867, he was made chancellor of the order *pour le mérite*; in February, 1882, he was made a privy councillor with the title *Excellency*; in 1885 his ninetieth birthday was celebrated amid general rejoicings, and the aged Emperor Wilhelm gave the special mark of his esteem by calling upon his illustrious subject. The historian resumed his pen and labored till within a few days of his death, which occurred on May, 1886.

Besides the works already mentioned, Ranke edited the *Correspondence of Frederick William IV. with Chevalier Bunsen* (1873), and the *Memoirs of Count Von Hardenberg* (1876-77), and published several treatises on important epochs in German history and a volume of *Biographical Studies* (1877). The full list of his works is marvellous, even when his prolonged studious life is duly considered. He abstained from controversy and contented himself with silent correction of proved error. He refused to fritter away his time in correspondence, though he occasionally indulged in agreeable relaxation in society. Of the utmost importance was his example of patient, indefatigable investigation as the essential preliminary of genuine history. He was successful in attracting to this department the best minds among those who waited upon his instructions. Nor was his influence in this regard confined to Berlin or even to Germany. Recent historians in England and France have evidently been benefited by his guidance. In his earlier works, since his conclusions were often at variance with those of his predecessors who had not access to the same wealth of documentary evidence, he often felt obliged to fortify his statements by copious citations from original sources. In his later works such authorities were weighed more carefully, and somewhat more scope was given to the historic imagination which he had formerly studiously repressed. He avoided as a plague the generalizations characteristic of French historians, though his writings exhibit a vivacity beyond the usual reach of the German mind. He takes rank in the highest class of German historians, though possibly through the necessary limits of his method he has not attained the yet higher place of the universally acknowledged masters of historic art. (J. P. L.)

RANSOM, MATT WHITAKER, general and senator, was born in Warren co., N. C., Oct. 8, 1826. He graduated at the University of North Carolina in 1847, and was then admitted to the bar. From 1852 to 1855 he was State attorney-general and in 1858 he was elected to the State Legislature. He attended the Confederate Congress at Montgomery, Ala., in 1861, and soon after entered the Confederate army as lieutenant-colonel. He served throughout the war and attained the rank of major-general. He was elected to the U. S. Senate in 1872, and has since been twice re-elected.

RANSOM, THOMAS EDWARD GREENFIELD (1834-1864), one of the bravest generals in the American civil war, was born Nov. 29, 1834, at Norwich, Vt. He was educated in that city at the military institute, conducted by his father, Col. Truman B. Ransom, who was killed in the Mexican war. The son afterwards went to Illinois and became a civil engineer and real estate agent. On the outbreak of the war he raised a company of volunteers and was appointed major of the 11th Illinois Regiment. After gallant service in Missouri he was engaged in the capture of Forts

Henry and Donelson. Though wounded at the latter, he took part in the battle of Shiloh six weeks later. In June, 1862, Gen. McClelland appointed him chief of his staff and inspector-general of the Army of the Tennessee. He was appointed brigadier-general in November, 1862, and his services in Mississippi in the next year called forth high commendations. In his *Personal Memoirs* Gen. Grant speaks of Ransom as a "most gallant and intelligent volunteer officer," and says that after the siege of Vicksburg he was well qualified to command a corps. Ransom was in Banks' Red River campaign, and for a time had command of McClelland's corps. He was again wounded at Sabine Cross-Roads in April, 1864, but he recovered in time to lead a division in the campaign against Atlanta. Here he succeeded to the command of the 17th corps. His ardor led him to overtask his body, enfeebled by illness, and he died at Rome, Ga., Oct. 29, 1864. Throughout his brief career he was distinguished not only for military ability and energy but for the highest Christian character.

RANUNCULUS, a genus of plants, comprising the well-known Buttercup or Crowfoot. The natural order *Ranunculaceæ* consists of plants having a separate calyx and corolla, the petals usually numerous, hypogynous, with numerous stamens, and the pistils all distinct and unconnected. *Ranunculus* has the petals imbricated in the bud, not valvate as in *Anemone*, and is well characterized by the solitary erect seed and a scale or pore inside the petal at the base. Representatives of the genus are found over the cooler parts of Europe, Asia, and America and in the mountainous parts of warmer latitudes, about one-third existing

Ranunculus.

either as natives or introduced species in the United States. In mountainous regions the flowers of some species are larger than the common field-buttercup, while the plants are much diminished in size, as most Arctic plants are. The name "Crowfoot" is derived from *Ranunculus Asiaticus*, which has a cluster of small black roots not unlike the foot of a crow. As often happens in such cases, the name has crept over the whole genus, embracing those with fibrous and bulbous roots as well as those of the original crowfoot style. In the United States "Crowfoot" is not often used as a common appellation, "Buttercup" having gained the popular appreciation. The origin of this common name is uncertain, but perhaps the butter-colored flower-cup may have been quite sufficient to suggest the name. The generic name, *Ranunculus*, denotes a little frog or tadpole, the connection between the two not being apparent, except that this plant, like many others, is found in marshy places.

Two of the leading Buttercups of Europe have flourished by introduction to the New World. In the New England States *Ranunculus acris* has found itself completely at home, and is one of the worst weeds the farmer has to contend with. Farther south, *Ranunculus bulbosus* is the prevailing Buttercup. *R. repens* is occasionally found. *R. sceleratus*, named from its excessive acrid qualities, as its specific name implies, the "Cursed Buttercup" or "Crowfoot," is found only abundantly along water-courses.

The acrid property is a strong characteristic of the genus. Before cantharides was introduced it was in general use for raising blisters. Cattle feeding on the leaves get sore mouths and often ulcerated intestines.

In the hands of careful practitioners the various species still serve useful purposes in medicine. In pasture-lands they cause great loss to the agriculturist from the amount of ground lost by their occupancy. The plant loses much of its acidity by drying, so that it is not as objectionable in hayfields as in pastures. It is easily destroyed by ploughing up the pasture-ground and putting it for a season in corn or potatoes. Most of the kinds growing wholly in water are free from acidity. *R. aquatilis* is a favorite food of cattle in Europe, and they thrive on it. Like most plants of this acid character, the bitter property is removed by boiling: when cooked many species are eaten as greens in the Old World. None of the truly indigenous specimens have obtruded themselves on the notice of the agriculturist in the United States. In California, *R. Californica*, a species having some affinity to the *R. acris* of Europe, is very abundant in the Coast ranges, so much so that the low grassy hills are often yellow with the shining flowers in early spring.

(T. M.)

RAPHAEL MORRIS JACOB (1798-1868), a Jewish rabbi, was born at Stockholm, Sweden, in September, 1798. He was educated at a Jewish college in Copenhagen, and in 1812 went to England for further study. After a Continental tour he spent three years at the University of Giessen, and in 1825 settled in England. In 1832 he began to deliver in London lectures on the Post-Biblical history of the Jews, and in 1834 he established the *Hebrew Review*, in which he published translations from the works of Maimonides and other celebrated rabbis as well as original poems and sketches. In 1840 he visited Syria on a mission to the Jews, and in 1841 he was called to be rabbi of a synagogue at Birmingham. He was prominent in various movements for the advancement of his race. In 1849 he was called to New York to be pastor of the congregation B'nai Jeshurun, and here became noted for his oratorical ability. He died June 23, 1868. His most noted work is the *Post-Biblical History of the Jews* (2 vols., 1856). He also published some devotional treatises.

RAPP, GEORGE (1770-1847), the founder of the Communistic religious sect of Harmonists, was a native of Württemberg, Germany, born in 1770. While still a youth he believed that he had experienced a divine call and was charged with the restoration of the Christian religion to its pristine purity. He did not long confine his efforts to spiritual instruction, but formed a plan of a community to be modelled on the system of the primitive church, all goods to be the common property of the association. In the realization of this project he found himself so hampered by state interference in Germany that he resolved to emigrate to America, where he hoped to be able to carry out his plans without official opposition. He reached this country in 1803, accompanied by a band of believers in his religious, social, and political views, and in 1805 founded the town of Harmony, on Connequeness Creek, Butler county, Pa., where the community engaged successfully in agriculture and manufacture. In 1815 they removed to a new location on the Wabash River, Ind., where a tract of 27,000 acres was obtained, and a settlement started under the name of New Harmony. Here the Harmonists became involved in pecuniary difficulties, and in 1824 sold this land and improvements to Robert Owen, who wished to try a socialistic experiment on a different plan. Rapp and his followers returned to Pennsylvania, and founded towns called Economy and Harmony, in Beaver county, on the banks of the Allegheny, 17 miles northwest of Pittsburgh. Rapp died here on August 7, 1847, but the community is still in existence. It owns 3500 acres of land, and in addition to agriculture is engaged in silk, woollen, and cotton manufacture. The industry and morality of the members of the community have gained it general esteem, and it stands as one of the few communistic

experiments that have had any measure of success. (See COMMUNISM.) (C. M.)

RASPAIL, FRANÇOIS VINCENT (1794-1878), a French scientist and revolutionary politician, was born at Carpentras in the department of Vaucluse, France, Jan. 29, 1794, and attained the chair of philosophy in the college of his native place. He was called to pronounce the oration there on the anniversary of the battle of Austerlitz, and this, on being submitted to Napoleon, elicited the remark: "Surveille ce jeune homme, il ira loin." In 1815 he hailed with joy the return of the Emperor and composed a song which was sung with enthusiasm everywhere. Removing to Paris in 1816 he took part in all the plots of the Restoration-period. In the Revolution of July, 1830, he was severely wounded. Later he was instrumental in founding the club of "The Friends of the People," and wrote a number of fugitive pieces against the July government, for which he suffered an imprisonment of 15 months. On the compulsory dissolution of "The Friends of the People" in 1832, he took part in founding "The Society of the Rights of Man." For a time he studied law, but, disgusted with its dry details, he turned from it and gave himself with enthusiasm to the natural sciences. His scientific writings of this earlier period were devoted to organic microscopic chemistry and to vegetable physiology. Beside general treatises he published *Histoire Naturelle de l'Insect de Gale* (Paris, 1834).

On the outbreak of the riots of April, 1834, he was again made prisoner, but being released after a short captivity he founded a revolutionary daily paper, *Le Reformateur*, which lived about a year. Raspail now devoted himself with redoubled zeal to science, and matured his camphor-system of medicine, proclaiming camphor as a specific against the germs of all, or most, zymotic diseases. This theory was set forth in his *Histoire Naturelle de la Santé et de la Maladie* (3 vols., 1839-46) and in several medical annuals which had extensive sale. On Feb. 24, 1848, at the head of a riotous mob, he stormed his way into the council chamber of the Provisional Government in the Hôtel de Ville, and compelled this body to proclaim the Republic. On February 27 appeared the first number of his *Ami du Peuple*, whose teachings he enforced by the establishment of a revolutionary propaganda through clubs of the "Friends of the People." Again, on May 15, he invaded the sitting of the National Assembly. Brought for this outrage along with Blanqui and other ringleaders before the high court of justice in Bourges, he was sentenced to six years' imprisonment in the citadel of Doullens. This confinement like the many others he had to undergo he utilized for the purposes of science, producing in his cell several of his most valuable works. In 1853 the Imperial government permitted him to exchange imprisonment for exile, and he settled in a village in Belgium. Elected a member of the Legislative Corps in 1869, he attached himself to the party of the extreme left and associated especially with Rochefort (q. v.). In 1876 he was chosen a member of the Chamber of Deputies. He died Feb. 8, 1878, at Arcueil near Paris. Besides almanacs and scientific and medical reviews he published *Reformes sociales* (1872).

HIS SON, BENJAMIN FRANÇOIS RASPAIL, born at Paris, Aug. 16, 1823, has trod in his father's footsteps. In 1849 he was elected to the Legislative Assembly, but being proscribed in 1851, sought refuge in Belgium and did not return to France till 1863. In 1876 he was elected to the Chamber of Deputies, where he took his place on the extreme left.

RASPBERRY, a member of the botanical genus *Rubus*, order Rosaceæ. The species of this genus, commonly known as brambles, are divided into two sections—the blackberry, in which the receptacle is non-persistent, juicy, and becomes part of the fruit, and the raspberry, with a persistent, dry receptacle, from which the fruit separates when ripe. The genus

is made up of shrubs and a few herbaceous, perennial plants, mostly with compound leaves, the fruit being one-seeded, pulpy drupes, which cohere in a head or cluster above the open calyx. The species of *Rubus* are very variable, there having been more than 500 described, though there are probably not over 100 good species.

The Eastern United States have two very common species, *R. strigosus*, the red, and *R. occidentalis*, the black raspberry, which yield favorite fruit in the wild state, and both of which are cultivated. These species have biennial, woody, and prickly stems, the leaves having 3 to 5 leaflets. The red raspberry extends from Newfoundland to Oregon, and southward to the Middle States. It has upright, prickly stems, and propagates itself by underground runners, which send up suckers from which new plants rise. These grow to a height of 5 or 6 feet in one season, bear fruit the next, and then die. This species abounds in the North, particularly on new clearings. Its fruit is of a light red color, and is yielded in profusion all summer. It is nearly, or quite, identical with *R. Ideus*, the European garden raspberry.

The black raspberry is more southerly in its range, and extends as far as Georgia. Its fruit is black in color, ripens in July, and is drier than the red berry. Its mode of growth is different, as it makes no suckers, the new shoots springing from the base of the old plant. Late in summer the branches, which become very long, bend over till their tips touch the ground, when they take root and yield new plants. In cultivation the bending tips are covered lightly with earth. This species, known as black-cap and thimbleberry, is common around old stumps and in fence-corners. When cultivated in deep, loamy soil the fruit increases nearly one-quarter in size.

There are several interesting American species belonging to another section of the raspberry group, in which the plants are not prickly, have simple leaves and large flowers, and the fruit is very broad and flat. The most interesting of these is *R. odoratus*, the rose-flowering, or the Virginia raspberry, as it is called in England. The flower is of a rich, rose-purple color, about 2 inches across: the fruit sometimes an inch broad, dry, but of pleasing flavor. This species is found in rocky places, from Canada to Georgia. Other species are *R. Nutkanus*, the white-flowering raspberry of the north-east coasts; *R. deliciosus*, the Rocky Mountain raspberry, a species with very large, white flowers, and fruit of indifferent flavor; and *R. chamamorus*, the cloud-berry, a creeping plant of the Arctic regions of Europe and America.

Of cultivated raspberries, one of the best varieties is the Hudson River Antwerp, a red variety of supposed European origin, which is grown abundantly along that river, and supplies the New York market. The Philadelphia raspberry is another prolific bearer, not of best quality, yet a profitable variety. Other favorite varieties of the red berry are the Cuthbert and the Hansell; of the black, the Gregg, which yields large fruit of excellent flavor and in great quantity. Of the yellow varieties, the Caroline and Brinckle's Orange rank among the best. In some sections the raspberry is less hardy than the blackberry, and it is best to cover the cultivated varieties for the winter with from 3 to 6 inches of corn-stalks, straw, etc. The fruit of the raspberry is too well known to need remarks. It forms an excellent dessert fruit, of sub-acid flavor, and is much used in making preserves, jellies, and other delicacies for the table and sick-room, and an agreeable summer beverage known as raspberry vinegar. (C. M.)

RASSAM, HORMUZD, an Assyrian explorer, was born in 1826, at Mosul, on the Tigris, opposite the ruins of Nineveh. He was of native Chaldaean descent, but his family became connected by marriage with that of Rev. George Percy Badger (q. v.). He assisted Layard in his explorations of Nineveh in 1845,

and accompanied him to England, where Rassam pursued a regular course of study at Oxford. In 1849 he returned to Mesopotamia to prosecute further the excavations at Nineveh, and when Mr. Layard withdrew from the work Mr. Rassam became the superintendent in behalf of the British Museum. After his return to England, in 1854, he was employed by the British government at Aden, and in 1864 he was despatched to Abyssinia to procure the release of Consul Cameron. He was, however, himself seized by King Theodore, and kept prisoner for nearly two years, until the close of Lord Napier's campaign, in April, 1868. Rassam published a *Narrative of the British Mission to Theodore, King of Abyssinia* (2 vols., 1869). After the death of George Smith, the Chaldaean explorer, Rassam was chosen, in 1876, to succeed him in his work under a liberal firman obtained from the Turkish government. Among his discoveries were the bronze gates of Balawat, 22 feet high, bearing memorials of the wars of Shalmanezzer II., which, with other treasures, were safely deposited in the British Museum. Again, in 1878, Rassam was sent to make new explorations in other parts of the Turkish dominions in Asia. He was engaged in these archaeological researches until July, 1882, having explored the ruins of Sipar, the Sepharvaim of the Bible, and of the Babylonian Cethra.

RAT. The two species of rat most common in the United States are the brown rat and black rat described in the *ENCYCLOPÆDIA BRITANNICA*. The general characters of the rats, and the relationship of their genera and specie to each other and to the other rodents, are stated in the same work in the article

MOUSE. There are, however, native American species of rat, all of which are sigmodont, rather than strictly murine, in their dentition. The old-world species, and especially the brown rat (miscalled Norway rat), are rapidly displacing the native species. The cotton-rat of the Southern States (*Sigmodon hispidus*) is the best known of our native rats. It is smaller than the common brown rat, and much less fierce and aggressive. (See COTTON RAT.) The Florida wood-rat (*Neotoma floridana*) is a large and handsome creature, with soft and delicate fur, which ought to have a commercial value. The squirrel-tailed wood-rat of the Rocky Mountains is very remarkable for its habit of building a great nest or house of sticks and brush, often in some tree or clump of large shrubs. This creature is a great thief, and is one of the pests of the frontiersman's life, carrying away to its secret stores towels, spoons, knives, soap, or any portable article not too large for it to handle. Its flesh is said to be very palatable, more so than that of any squirrel or rabbit. Not unfrequently various species of the mouse kind quarter themselves as guests in the commodious house of this curious wood-rat, where they appear to be well received. South America has quite a number of large rat-like rodents, for the most part little known to science. (C. W. G.)

RATIONALISM. As intimated in the *ENCYCLOPÆDIA BRITANNICA*, this term is capable of a much wider application than is there discussed. Lecky, whose *History of Rationalism in Europe* is one of the most widely read books of modern times, thus states his own conception of a proper use of the term: "It [rationalism] leads men on all occasions to subordinate dogmatic theology to the dictates of reason and of conscience, and, as a necessary consequence, greatly to restrict its influence upon life. It predisposes men in history to attribute all kinds of phenomena to natural rather than miraculous causes; in theology, to esteem succeeding systems the expression of the wants and aspirations of that religious sentiment which is planted in all men; and in ethics to regard as duties only those which conscience reveals to be such."

This will be recognized as a marked departure from

the definition accorded to the term "rationalism" by the earlier writers on the subject. In itself it is an indication of a modified process on the part of rationalists, while the domain of their inquiry and investigation is enlarged. To its progress is assigned the credit of sweeping away faith in magic and witchcraft, of destroying fetishism and faith in miracle, anthropomorphism, relic-worship, and finally persecution itself. These beneficent results are ascribed to rationalism, which owed its power in England largely to the reaction against Puritanism, the influence of Hobbes, and the Baconian philosophy, as represented by the Royal Society.

Rationalism, however, in its proper interpretation and ultimate analysis, elevates the reason as the sole arbiter in religion, and, by a necessary consequence, denies to the historian the use of facts and to the ethical inquirer the use of emotions or of conscience. Certain *a priori* truths determine everything else. It is not difficult to see that such a narrow basis in philosophy or in theology must sooner or later reveal its insufficiency. Applied to statesmanship, it would demand that in government all the fruits of history should be ignored; to political economy it would deny the records of markets; and to religion everything of an experimental and emotional character. In short, its opponents claim that it is equally inconsistent to relegate the ultimate appeal in matters of religion solely to reason, as it would be to confine our judgment of the properties of matter to any one of the five senses, excluding the others.

Lecky's definition, given above, is an indication of the extent to which rationalists themselves have departed from the early principles of a rationalistic philosophy, and have attempted to bring to their aid other powers than those of reason alone.

The root of modern rationalism is probably to be sought in the Cartesian philosophy. Des Cartes' syllogism of universal doubt could not help, sooner or later, invading the realm of theology, and we are not surprised to find him followed by philosophers of his own school, who claim for reason a place as infallible as is accorded to the Divine Creator of reason.

The rationalism of Germany owed its remarkable prevalence to several concurrent causes. The mysticism of the Pietists on the one hand contributed to bring the stricter forms of orthodoxy into contempt. Prominent theologians, like Michael Lang of Altdorf, J. Lange and Rambach, claimed for the witness of the Spirit a superior place to the teachings of dogmatic theology. The "inner spark," the "inner word," became a substitute for system and creed, until serious and devout men began to feel that uncertainty rested upon all religious conclusions. The Bible itself was regarded as of so little authority that to the cultured and learned men of the time it was little better than a book of fable.

This result had been hastened by the demoralization consequent upon the Thirty Years' war, which debased the nobles and the masses alike, so that infidelity became almost universal. Then came German Idealism, with its beautiful but deceptive promise, and under Kant sought to counteract the method pursued by Voltaire and Volney, and the French Encyclopædists. It was designed to oppose the deists on the one hand and the supernaturalists on the other, and to establish its principles on the basis of the superiority of reason to revelation, while the fact of the existence of a credible revelation was assumed. Semler, J. G. Michaelis, and J. G. Eichhorn were among the early theologians to apply this philosophy to theology. Of these, Eichhorn may be regarded as the most important writer. He developed his principles in his *Universal Library of Biblical Literature* (10 vols., Leipzig, 1788-1801), and in his *Introduction to the Old and New Testaments*, which appeared in 7 volumes, at Göttingen, in 1824.

Singularly enough, the philosophers whose metaphysics furnished the basis for these theological con-

clusions, like Fichte and Schelling, do not hesitate to stigmatize the work of these rationalists as commonplace and vulgar. The greatest, and by all means the most powerful, exponent of the school of rationalism was Dr. H. E. G. Paulus (1761-1851). He held that we must discriminate between statements of facts and of opinions in the Bible. A fact is that which has occurred within their experience; an opinion is their expression of the conditions under which it occurred. As these are naturally and necessarily confused in Bible records, it is the duty of the critic to separate them. Of course, all supernatural or divine interference is denied and miracles are discredited. Christ, according to this view, was not divine, but he was a wise and virtuous man. He wrought no miracles—what appeared such were simple events, easily explained. The healing of the blind was due to an efficacious powder secretly applied to the eyes. The transmuting of the water into wine never occurred—Christ simply had his disciples bring wine, where nothing but water had been provided. Peter sold a fish, and thus secured the money for tribute, etc. These are given simply as illustrations of that form of rationalism which sought its basis in the ideal philosophy. According to its theories, truth was to be sought not by empirical processes at all, but in the line of certain *a priori* principles by which all truth is to be judged. Guided by these principles, the rationalists sought to explain the truths of theology. Some doctrines of Christianity were allegorized, many others were swept away altogether.

The German idealists, of whom Kant was incomparably the greatest, were succeeded in their influence upon theological thought by Frederick Henry Jacobi (1743-1819), one of the most powerful thinkers of any time. He insisted that all knowledge communicated to us by the understanding (reason) is contingent, and never universal, infinite, or purely philosophical. To demonstrate any truth we must infer it from another and so on to an infinite series. All human knowledge, he insisted, depends at last on faith or intuition. Sensation itself, he affirms, is a mystery and our knowledge of it rests on our faith in our memory of its presence. God, providence, freedom, moral distinctions, are ideas that do not come to us by proofs. They are ours by intuition. It is by the twofold office of this faculty therefore that we cognize two worlds—the whole material of truth comes within the scope of our knowledge and man is thus prepared to approach the questions of this world and of the world to come; "the immediate certainty of feeling" was emphasized, and it was claimed that every perception proved something actual present, whose existence and conditions were independent of our internal laws and faculties. He was followed by Bouterwek, Krug, Fries, Schlegel, Novalis, Schubert, Baader, and others who pursued his principles with varying success. Greatest among all those who availed themselves of the fruits of his philosophy was F. D. E. Schleiermacher (1768-1834). This wonderful philosopher and divine, while he is properly classified as a modified rationalist, wrought effectively to save theology from the destructive tendencies of his predecessors. He gave to German thought an uplifting that prepared it for Hase's *Huterus Redivivus*, which was the deathblow to German Rationalism and so effectively destroyed it that instead of being recognized as scientific it is henceforth distinguished as "Rationalismus Vulgaris."

The writings of Strauss and Renan seem to proceed upon the basis of an endeavor to find at the bottom of the Gospel narrative some veritable history. In the work of Strauss there is an attempt to explain by what is known as the mythical theory the prevalent beliefs of Christianity. According to him Christ really lived and taught and died, but his disciples innocently poetized his life, and having been rudely shocked by his dying, were really comforted by the mistaken belief that he had risen from the dead. These myths which

constitute the Gospel history were according to Strauss not invented by any single individual, but were the offshoot of the collective impression of a community or communities of people.

According to Renan these accounts were rather the transfiguration of fact than a pure creation of pious enthusiasm. Christ's disciples, partly through pious fraud and partly by blind enthusiasm, secured the appearance of the miraculous, to which deception Christ interposed no objection. The resurrection of Lazarus was a pretended resurrection contrived by Christ's disciples for popular effect, to which Jesus reluctantly yielded his assent and pretended agency.

But these later authors have exercised little permanent influence, and their writings are interesting chiefly as they relate to the history of rationalism. Theodore Parker (1810-1860) is the only American of prominence whose name is associated with rationalism, but his position is so imperfectly defined that such a classification may at least be said to be doubtful. (See PARKER, THEODORE, in the *ENCYCLOPÆDIA BRITANNICA*.)

The present time seems to be marked by an attempt to use the word Rationalism in a broader sense than has been attributed to it in the philosophic movements of the past. It is neither naturalism, rationalism in its narrowest sense, nor supernaturalism, all of which have been included in one classification by some of the writers on this subject. The claim which is made under this term in its latest use embraces all progress by which the world has emancipated itself from superstition and error and come under the sway of enlightened reason.

Whether the attempt to make it synonymous with a true social economy, which is the essay of Lecky, shall be successful or not remains yet to be determined.

RATTLESNAKE. See **SNAKES**.

RAU, CHARLES (1826-1887), archaeologist, was born at Vervien, Belgium, in 1826. After finishing his education in Germany he returned to the United States in 1848 and engaged in teaching. Becoming deeply interested in American archaeology during his residence in the West, he contributed on this subject first to European periodicals, and from 1863 onward to the reports of the Smithsonian Institution. For *Harper's Magazine* he wrote a series of articles on the "Stone Age in Europe," which afterwards formed the volume, *Early Man in Europe* (1876). In 1875 he was appointed a curator in the archaeological department of the U. S. National Museum at Washington and he held this post till his death. Besides some monographs he published a catalogue of the Museum (1876), and several of his fifty papers were collected under the title *Articles on Anthropological Subjects*

(1882). He died at Philadelphia, July 25, 1887, leaving two works in an unfinished state. His eminence as an anthropologist was widely recognized, as was shown by his membership in all the European and American archaeological and anthropological societies.

RAUCH, FREDERICK AUGUSTUS (1806-1841), educator, was born at Kirchbracht, Hesse-Darmstadt, July 27, 1806. He was educated at the Universities of Marburg, Giessen and Heidelberg, and was for a time professor in the last named. In 1831 he removed to the United States, and entered the ministry of the German Reformed Church. He was, however, chiefly engaged in educational work, being professor of German at Lafayette College, and principal of academies at York and Mercersburg. When a theological seminary was established at the latter place he was made professor of Biblical literature in it, and when Marshall College was founded there in 1836 he was made president. He died at Mercersburg, March 2, 1841. His principal English work is *Psychology* (1840).

RAUMER, FRIEDRICH LUDWIG GEORG VON (1781-1873), German historian, was born at Wörlitz, May 14, 1781. He studied law at the Universities of Halle and Göttingen and had entered the Prussian civil service, but in 1811 was made professor at Breslau and in 1819 professor of political science and history at Berlin. As early as 1806 he had published *Sechs Dialoge über Krieg und Handel*, and in 1810 *Das britannische Besteuerungssystem*. In 1821 his lectures on ancient history were published, and they passed through four or five editions in his lifetime, as did also his *Geschichte der Hohenstaufen und ihrer Zeit* (6 vols., 1823-25; 5th ed., 1878). This noted work clearly displays his ability as a philosophic historian, his masterly combination of insight with practical experience. Von Raumer's interesting essays on the *Development of the Ideas of Law, the State and Politics* first appeared in 1826, and the third edition in 1861. After some *Letters from Paris* on the history of the 16th and 17th centuries, he undertook his great work *Geschichte Europas seit dem Ende des 15. Jahrhunderts* (8 vols., 1832-50). By translations of this work he is chiefly known outside of Germany. It is second only to the labors of Ranke in the same field. Von Raumer was attracted to England by the historical treasures of the British Museum and other repositories, and while using these for essays he also published his impressions of the country and people. He next visited Italy and finally the United States. His description of the latter, of whose political institutions he was a warm admirer, was published in 2 volumes at Leipsic in 1845. Two years later he resigned his post as secretary and member of the Berlin Academy on account of the unfavorable reception of his address on Frederick II. He was elected to the Frankfort national assembly in 1848, and joined the moderate conservatives. He had also some diplomatic experience at Paris, of which he published an account, and on his return became a member of the Prussian parliament. Although he resigned his professorship in 1853, he continued for some time longer to give lectures. His later writings, besides a *Hand-book of the History of Literature* (4 vols., 1864-66), were chiefly letters and reminiscences. He founded the *Historische Taschenbuch* (Series 1-4, 1830-67), which was renewed in 1871, and continued after his death. He died at Berlin, June 14, 1873.

His brother, **KARL GEORG VON RAUMER** (1783-1865), scientist, was born April 9, 1783, in Wörlitz, near Dessau. He studied law at Halle and Göttingen and thereafter attended the Mining Academy at Freiberg, on leaving which he made geognostic tours in Germany and France. From 1806 to 1811 he filled several legal offices, and in the latter year was appointed professor of mineralogy at Breslau. In the German War of Liberation he served in 1813-14 as adjutant on Blücher's general staff; in 1819 became a professor in Halle; in 1823, a co-director of the Dittmarsch Edu-

cational Institute, in Nuremberg; and finally, in 1827, professor of mineralogy and natural history in the University of Erlangen. His geographical and geological writings acquired wide fame. Among his works may be noted: *Geognostische Umrisse von Frankreich und Gross Britannien* (1816); *Das Gebirge Niederschlesiens* (1819); *Lehrbuch der allgemeinen Geographie* (1832); *Palästina* (1835); *Der Zug der Israeliten* (1837); *Geschichte der Fädagogik* (1842), which passed through several editions; *Erinnerungen an die Freiheitskriege* (1850); *Die Erziehung der Mädchen* (1853). He died at Erlangen, June 2, 1865, and his *Autobiography* was published in 1866. His son, RUDOLF VON RAUMER (1815-1876), was noted as a philologist, and was professor of German language and literature at Erlangen from 1852 till his death.

RAWLE, WILLIAM (1759-1836), jurist, was born at Philadelphia, April 28, 1759. He was of Quaker descent and studied law in New York, London, and Paris. Returning to Philadelphia in 1783, he became distinguished in his profession. In 1789 he was elected to the Pennsylvania Legislature, and in 1791 he was appointed U. S. district attorney. He held this office eight years, having in the meantime declined the position of U. S. attorney-general. He was the first president of the Pennsylvania Historical Society, and received the degree of LL. D from Princeton College, in 1827, after the publication of his excellent *View of the Constitution of the United States* (1825). He was long at the head of the Philadelphia bar, and students were attracted by his fame from distant places. He died April 12, 1836. See his *Memoir* by T. J. Wharton (1840), and a tribute to his memory in D. P. Brown's *Forum* (1856). His son, William Rawle (1789-1858), published several volumes of *Pennsylvania Reports*, and his grandson, William Henry Rawle, born in 1823, has published the *Law of Covenants for Title*, and other legal works.

RAWLINS, JOHN AARON (1831-1869), general, was born at East Galena, Ill., Feb. 13, 1831. He was brought up to a frontier farmer's life, but showed fondness for reading. He studied law at Galena and was admitted to the bar in 1855. He became noted as a speaker in the exciting political campaigns of the time, and in 1860 was a candidate for Presidential elector on the Douglas ticket. On the outbreak of the war he ardently supported the cause of the Union, and in September, 1861, U. S. Grant, on receiving his commission as brigadier-general, appointed his fellow-townsmen Rawlins assistant-adjutant-general, with the rank of captain. He remained in close relation to Gen. Grant till the close of his life. He was made brigadier-general in 1863, and chief of staff to the lieutenant-general March 5, 1865. Gen. Grant frequently bore testimony to his ability and integrity, and on becoming President he appointed Rawlins Secretary of War, but after six months' tenure the latter died, Sept. 6, 1869. A bronze statue of him has been erected in Washington.

RAWLINSON, GEORGE, an English clergyman and historian, was born at Chadlington, Nov. 23, 1815. He was educated at Ealing School and Trinity College, Oxford, graduating in 1838. He was made fellow of Exeter College and after holding a tutorship for some years was appointed classical moderator at Oxford in 1852, and public examiner in 1854. In company with his brother Henry and Sir George Wilkinson, he prepared an annotated English translation of *The History of Herodotus* (1858-60). He delivered the Bampton lectures in 1859 on *The Historical Evidences of the Truth of the Scripture Records* (1860). In 1861 he was made Camden professor of ancient history at Oxford and took part in the movement for University reform. In 1872 Prof. Rawlinson was made a canon of Canterbury. He had in the meantime continued his literary labors and had published *The Five Great Monarchies of the Ancient Eastern World* (4 vols., 1862-67). To this he afterwards added a *History of*

the Parthian Empire (1870), and finally *The Seventh Great Oriental Monarchy; the Sassanian Empire* (1876). He has published some smaller works on historical and Biblical subjects, and has contributed to Smith's *Dictionary of the Bible*, the *Speaker's Commentary*, and other works. Of his later works may be mentioned *The Origin of Nations* (1878); *History of Egypt* (2 vols., 1881); *Religions of the Ancient World* (1882); *Egypt and Babylon from Scripture and Profane Sources* (1884).

His elder brother, SIR HENRY CRESWICK RAWLINSON, was born in 1810, and served in the Bombay army from 1827 till 1833, when he was sent to Persia, where he was actively employed until 1839. In the next year he was appointed political agent at Kandahar where, amid the troubles of the Afghans, he succeeded in preserving peace. In March, 1844, he was appointed consul at Bagdad, and in 1851 consul-general. In 1853 he resigned this post and was made a director of the East India Company, and in 1856 K. C. B. In 1858 he was for a short time a member of Parliament, and in September was made a member of the council of India. In April, 1859, he was sent as envoy to Persia. He was again in Parliament 1865-68, and was then reappointed a member of the council for India. In 1878 he was made a trustee of the British Museum. He has published many papers on the antiquities of the East, and gathered into a volume *England and Russia in the East* (1875).

RAY, ISAAC (1807-1881), alienist, was born at Beverly, Mass., in 1807. He graduated at Bowdoin College in 1827 and studied medicine. While engaged in practice at Eastport, Me., he entered on the study of insanity, the result of which was given in his *Medical Jurisprudence of Insanity* (1838). He was called to take charge of the State Insane Hospital, at Augusta, and in 1845 was made superintendent of the newly established Butler Hospital, at Providence, R. I. In 1866 he removed to Philadelphia, and he died there March 31, 1881. He published several treatises on mental health, and contributed on the same topic to medical journals.

RAYLEIGH, JOHN WILLIAM STRUTT, BARON, was born at Ferling Place, Essex, England, Nov. 12, 1842. Being of a delicate constitution, he was placed under a private tutor, and early developed a fondness for experimental research, his chief amusement while young being in photography. In October, 1861, he entered Trinity College, Cambridge, where he was classed by his fellow-students among the "reading men." He took several prizes and graduated with distinguished honors, being both senior wrangler and Smith's prizeman. Trinity elected him a fellow, as is the custom towards students who distinguish themselves in the final examination. On June 14, 1872, he succeeded to his title of Baron Rayleigh, and in the same year was elected a Fellow of the Royal Society, to whose *Transactions* he had contributed many important papers. In 1882 the medal of this society was conferred upon him, in recognition of the importance of his scientific work. On the death, in 1879, of Clerk Maxwell, professor of Experimental Physics at Cambridge, Lord Rayleigh was elected to the professorship, and since then has devoted much time to the organization of the magnificent Cavendish laboratory. In 1884 he was president of the British Association during its session in Montreal.

Lord Rayleigh's writings are scattered through the proceedings of several of the learned societies of England. Some of them have been collected into a volume and published separately, but the deep mathematical studies involved render them too difficult for general reading. His only extended work, *The Theory of Sound*, is a valuable mathematical treatise in two volumes. He also wrote the article on "Optics" for the *ENCYCLOPEDIA BRITANNICA*. His determination of the ohm was accepted by the Paris Conference of Electricians (1883-4) as the basis of electrical resist-

ance, and his recent experiments on measuring the strength of the electrical current by the deposition of silver promise to result in a method of great accuracy. Lord Rayleigh is still actively engaged in the study of optics, electro-dynamics, and kindred sciences, and is a mathematician of marked ability. (C. M.)

RAYMOND, HENRY JARVIS (1820-1869), journalist, was born at Lima, N. Y., Jan. 24, 1820. Brought up on a farm, he graduated at the University of Vermont in 1840 and went to New York city to study law. Coming into contact, however, with Horace Greeley, he began to write for the press, and when the *New York Tribune* was established, in 1841, Raymond was associated in the enterprise. He developed special excellence as a reporter of public addresses and skill in securing important news. Eventually his more conservative character led to some differences with Greeley, and in 1848 he became assistant editor of James Watson Webb's *Courier and Enquirer*. He had already been literary adviser of the publishing firm of Harper Brothers, and to his suggestion the founding of *Harper's Magazine* in 1850 was due. Raymond's activity reached beyond newspapers and periodicals, and in 1849 he was elected to the State Legislature as a Whig. In the next year he was chosen Speaker of the Assembly, and, after a visit to Europe, he determined to establish a newspaper of his own. The *New York Times* accordingly made its first appearance Sept. 18, 1851, and by his wise management speedily won success. Raymond was an anti-slavery Whig, and in the national convention of his party at Baltimore in 1852 he declared the position of the Northern Whigs. Though his party was defeated in the election following, he still had such influence in his State that he was chosen lieutenant-governor in 1854. More than ever determined to resist the aggression of the Southern slaveholders, he assisted in forming the Republican party and drafted the *Address to the People*, issued by its first national convention at Pittsburg in 1856. Its presidential candidate, John C. Fremont, was defeated, and in the next year Raymond declined a renomination as lieutenant-governor. In 1859 he went to Europe, and as a war correspondent accompanied the French army in its campaign in Northern Italy. In the Republican National Convention at Chicago, in 1860, Raymond advocated the nomination of Seward, yet acquiesced in the choice of Lincoln, to whose election he contributed. In 1861 he again became a member and Speaker of the New York Assembly. In 1864 he was prominent in the Republican National Convention at Baltimore, which nominated Pres. Lincoln for a second term. He was then elected to Congress, and in that body, after Andrew Johnson had succeeded to the Presidency, Raymond followed Secretary Seward's example in supporting Johnson's new policy towards the Southern States. In furtherance of this movement a convention was held in Philadelphia in 1866, for which Raymond wrote the *Address and Declaration of Principles*. The movement, however, was a failure, and he resolved thenceforth to confine his energies to journalism. Overwork and, perhaps, disappointment brought his career to a premature end at New York, June 18, 1869. Apart from his contributions to newspapers and periodicals almost his only publication was a *Life of Abraham Lincoln* (1865). See *Maverick's Henry J. Raymond and the New York Press*.

(J. P. L.)

READ, GEORGE (1734-1798), a signer of the Declaration of Independence, was born in Cecil co., Md., Sept. 18, 1733. His father had come from Ireland in 1726 and eventually settled in New Castle co., Del. The son was educated under Rev. Francis Allison and studied law in Philadelphia. Being admitted to the bar, he settled at Newcastle, and in 1763 he was made attorney-general of Delaware. He resigned this office on being chosen a delegate to the Continental Congress in 1774. In 1776, though he did not vote for the passage of the Declaration of Independence, he after-

wards signed it. He also presided at the convention which framed the constitution of Delaware, and in 1777 he became its chief executive on the capture of Pres. McKinley. He was made, in 1782, a judge of the Court of Appeal in admiralty cases. In 1788 he assisted in framing the Federal Constitution, and under it he was elected to the U. S. Senate. At the close of his term in 1793 he was made chief justice of Delaware and held this office till his death, Sept. 21, 1798. His *Life and Correspondence* was published by his grandson, William Thompson Read (Phila., 1870).

READ, THOMAS BUCHANAN (1822-1872), painter and poet, was born in Chester co., Pa., March 12, 1822. At the age of 17 he went to Cincinnati and studied art under the sculptor Clevenger. In 1841 he opened a studio in New York, but soon removed to Boston. His first volume of *Poems* appeared in 1847, and in the next year he edited *The Female Poets of America*. He spent some years in art-study in Rome, and returned to Cincinnati in 1858. The *New Pastoral* (1885), describing the removal of a farmer's family from Pennsylvania to the Mississippi Valley, gives many faithful pictures of American rustic life and scenery. The outbreak of the civil war stimulated Read's genius to the production of *The Wagner of the Alleghenies* (1862), which was read through the country by the elocutionist, James E. Murdoch, for the benefit of the Sanitary Commission. A shorter but more famous poem, written for Mr. Murdoch, was *Sheridan's Ride* (1864), in illustration of which Read afterwards employed his pencil with success. He died at New York, May 11, 1872.

READING, a city of Pennsylvania, the county-seat of Berks co., is on the Schuylkill River, 58 miles N. W. of Philadelphia, with which it is connected by the Philadelphia and Reading and the Schuylkill Valley Railroads. Fourteen different lines of railroad meet here. The city is regularly laid out, and its site gradually rises to the neighboring hills, which not only afford picturesque views, but give a copious supply of pure water. Besides a court-house and city-hall it has an opera-house, academy of music, public library, 38 churches, a normal, high, and other public and private schools. There are also three national banks, a savings bank, and 5 daily and 12 weekly papers, half of which are in the German language. Reading is largely engaged in iron and steel manufactures of all kinds, rolling-mills, foundries, furnaces, and machine-shops being numerous. There are also manufactures of hats, paper, cigars, cotton-goods, bricks, etc. Reading was settled in 1748, was made a borough in 1783, and a city in 1847. Its population in 1880 was 43,278.

REAGAN, JOHN HENNINGER, statesman, was born in Sevier co., Tenn., Oct. 8, 1818. He received a partial college education but did not graduate. Becoming a lawyer, he went in 1839 to Texas where he was a deputy-surveyor of public lands for four years. In 1847 he was elected to the State Legislature and in 1852 was made judge of a district court. In 1857 he was elected to Congress and in 1861 he was a member of the State Convention which declared the secession of Texas. He was sent as delegate to the provisional Confederate Convention and in March, 1861, was made postmaster-general of the Confederacy. This position he held till the close of the war, being also for a short time acting secretary of the treasury. In 1875 he was a member of the Texas Constitutional Convention and was also elected to Congress, in which he has since served by repeated re-election. He has been a prominent advocate of congressional supervision of interstate commerce, and the act passed in 1886 substantially embodies the measures which he has long urged.

REAPING MACHINES. See AGRICULTURE, Chap. III.

REBER, FRANZ VON, German art-historian, was

born at Cham, Bavaria, Nov. 10, 1834. He was educated at Munich, and in 1863 was made professor extraordinary and assistant in the Royal Mint-Cabinet. In 1869 he became professor of art-history and aesthetics in the Polytechnic School at Munich. In 1875 the charge of the Royal Galleries was also committed to him. He has published *Die Ruinen Roms und der Campagna* (1863); *Geschichte der Baukunst des Alterthums* (1866); *Kunstgeschichte des Alterthums* (1871), which has been translated into English as the *History of Ancient Art* (1886); *Geschichte der neuern deutschen Kunst* (1876); and *Kunstgeschichte des Mittelalters* (1886). Reber's works are characterized by a comprehensive sympathy with art in all its developments.

RECEIPT in law, as in common language, denotes a written acknowledgment of payment of money or delivery of chattels. It is executed by the person to whom payment or delivery is made. The receipt of one person is, as a general thing, inoperative against another. It must acknowledge the payment or delivery, must be delivered to the debtor, and must be in writing; a memorandum of payment made by the creditor in his own books has been held not to be a receipt. The acknowledgment of payment is presumptive evidence merely, and is not regarded as binding or conclusive. For instance, it may be shown that it was obtained by fraud, or given under a mistake, or that in fact no money was paid as stated. A receipt acknowledging payment "in full" of a specified debt or "of all accounts" or "of all demands" is of a much higher and more conclusive nature. It has been held that an adjustment of the amount due, and a payment of the specified sum as a final satisfaction, may be inferred from such an acknowledgment. Generally speaking, a receipt "in full" is conclusive when the party giving it cannot complain of any misapprehension or fraud with regard to the compromise he was making. Evidence of misrepresentation or fraud in explanation of such a receipt must be clear and full and to the effect that there was not in fact an intended and valid compromise of the demand.

A receipt given under seal, as a general rule, cannot be contradicted. There is an exception to this rule, however, in the case of a receipt for the consideration money, frequently inserted in a deed of real estate. It has been generally held that for the purpose of sustaining the conveyance as against the vendor and those claiming under him, the receipt is conclusive: they are estopped to deny that a consideration was paid sufficient to sustain the conveyance: but in an action for the purchase-money or upon any collateral demand, e. g., to recover a debt paid by the conveyance, or for damages for breach of covenant in the deed, etc., the grantor may show that the consideration was not paid or that an additional consideration was agreed upon, etc. A receipt in a deed may also be contradicted or explained on the ground of fraud.

It has been generally held that a receipt embodying a contract is not open to explanation or contradiction as in the case of a simple receipt. For example, a receipt containing an agreement as to the application of the money paid cannot be contradicted by parol evidence inconsistent therewith. The receipt for the goods in a bill of lading, however, may be explained.

(T. B.)

RECEIVERS are assignees of insolvent corporations acting under special directions from a court, and, therefore, not strictly within the laws of bankruptcy. The practice of appointing receivers grew out of the U. S. Bankrupt Laws, which were enacted soon after the civil war and held for about 15 years. In the several States the laws relating to bankruptcy differed materially, and in many of them the practice of appointing receivers has obtained. The State of New York is taken as a leading example of the whole. Previous to 1882 it was not uncommon for savings banks and life-insurance companies suddenly to become insol-

vent, and the expenses of closing them were so long continued and so large that widows and others who could least afford it were deprived of their means of support. The abuse of trusts of that nature became so marked that the Legislature of 1882, through its committees on insurance, made a strict investigation of insurance companies which had been closed within the previous five years. Strict inquiries were made of the insurance department in regard to every insolvent company as a basis of commencing the work. The first law that compelled receivers to report directly to the insurance department (passed in 1867) required the trustees and receivers of such companies not only to make annual statements of their income, etc., but also such other statements as the superintendent of the insurance department might require. Another law, in 1869, extended these provisions to registered policies of life-insurance, and it also provided that the compensation of the receiver should be fixed by the superintendent, and should not exceed 5 per cent. of the total amount of the assets of such company as should come into his possession. In 1873 it was declared that the Supreme Court might appoint a receiver of a fire-insurance company whenever any stockholder had made a formal complaint to the superintendent, and that complaint had been neglected for 10 days. In 1880 a law was passed requiring receivers to file duplicate copies of their reports with the attorney-general or else such receivers might be removed. It was also required that receivers of banking corporations must file duplicates of their reports with the banking department. Early in the investigation of the Assembly Committee it was discovered that the receiver of a savings bank had been paid over \$50,000 for his services in four years, and that the receivers of insurance companies had absorbed an aggregate of \$725,000, and those of savings banks \$1,000,000. Of the 22 broken banks 18, and of the insurance companies 14, were still in the hands of receivers. An application had been made to dissolve the corporation of a leading elevated railroad in New York city; the suit had been discontinued and another suit admitting the legality of the company and declaring its insolvency had been commenced—closely followed by the appointment of receivers. The Committee of the Assembly examined 13 life-insurance companies—one of which may be taken as a specimen of all. This company had absorbed four smaller corporations. In this process not only had the assets of the policy-holders been transferred, but even the rights of the policy-holders had become so confused as to offer but little show of existence. The receiver was supposed to be capable of performing the duties for which he was so largely paid; but his first act was to appoint a "practical man," also at a large salary, to do his work. In defiance of the law which provided that nothing should be drawn out for expenses without an order of the court, this receiver, like most others, drew on the collected fund on his own order. Suits were begun or compromised by him at his own discretion; and the expenses of winding up the 5 companies had aggregated \$175,000 in 5 years—with no prospect of a final settlement. In summing up its report the committee declared that only one of the 13 companies had been managed by the receiver on business principles; that receivers were appointed one after the other—no one appearing to wish the job completed; that the same attorneys frequently appeared as counsel for different insolvent companies. "Interveners" had sprung up to defend the rights of policy-holders, while no such defenders were necessary, because no application could be made to the court by the receiver except upon five days' notice to the attorney-general; and that these interveners, while outwardly defending the policy-holders, were actually in collusion with the receiver and his schemes to grasp more money.

The abuses of receiverships having thus been fully shown, the Legislature of 1883 passed a law providing

that every receiver should be allowed 5 per cent. of the first \$100,000 that he received and paid out; and 2½ per cent. of all sums received and paid out in excess of that sum. It also provided that reports should be made semi-annually instead of quarterly; that the attorney-general should examine the receivers' books at least once in twelve months; and that the affairs of every insolvent corporation then in the hands of a receiver should be closed up within one year from that time unless the court should grant additional time for that purpose; that the attorney-general might, at any time he deemed necessary, take proceedings for the removal of a receiver and the appointment of another in his stead, and any appeal should be made to the general term; that copies of all papers relating to the administration of the trust should be served on the attorney-general; that no receiver should pay any money to any person in any action until the expiration of eight days after a certified copy of the order had been served upon the attorney-general; that all applications to the court should be made in the judicial district where the principal office of the corporation was located—to which district was changed the venue of all actions pending elsewhere; and that legal proceedings in receivership cases should be preferred before all else, on the court calendars, save the cases wherein the plaintiffs are the people of the State. The Attorney-General of New York now has a large share of the responsibility; and the courts no longer decide whether the receiver has been an executor or an administrator *de bonis*. In 1885 the law of 1883 was amended so that every receiver of an insurance, banking, or railroad corporation, or trust company, must present a report every six months to the Supreme Court of the district wherein his trust is located, and must file duplicates with the bank or insurance companies respectively and with the attorney-general showing all the receipts and expenses of his trust. It was also provided that it should not be lawful for any receiver to pay any attorney or counsel until he had stated the amounts to the court as expenses already incurred—such expenses to be approved by the court before being paid to such attorney or counsel. In 1886 a law was passed providing for the winding up of corporations which had been dissolved by legislative enactment. In 1887 it was enacted that no receiver of a life-insurance company should be appointed if such company had actual funds invested of a net cash value equal to its liabilities and a proper reserve fund on policies and claims not matured. (F. G. M.)

RECIPROCITY, COMMERCIAL. This term is used to denote an arrangement between nations allowing specified classes of articles to pass from one to the other free of duty. By the treaty between the United States and Canada made in 1854, natural products of both countries, including agricultural products, animals, lumber, coal, ores, etc., were to be admitted into each country free of duty, and the privilege of fishing in Canadian waters was conceded to the United States. This treaty expired by limitation in 1866. Soon after the expiration of the treaty all the provinces of Canada were formed into a confederation known as the Dominion. The new state had no especial policy in regard to customs; but the increasing expenses of internal improvements compelled the Dominion to seek new methods of meeting them. In 1873 what was known as the Mackenzie (or liberal) government of Canada favored such freedom of trade with the United States as was consistent with levying customs duties on articles produced or manufactured in the country. The proposed treaty was upheld by the Canadian government on the ground that Canadian resources would develop so rapidly that its side of the bargain would be the best. It was contended that Canadian manufacturers did not dread competition with those of the United States, as the Canadians had the advantage of cheaper labor, cheaper machinery, and cheaper materials; that the farming, shipping,

lumbering, and railway interests would all be benefited; and that the almost unlimited water power of Canada ought to turn the scale in favor of the treaty. But the Dominion Board of Trade, supported by the conservative press, strongly opposed the new treaty as disadvantageous to Canadian interests, and the movement failed.

In 1878 a revolutionary wave passed over Canada and swept the Mackenzie government out of power. The Macdonald government returned with authority from the people to construct a protective tariff—a step which was at once taken. The debates in Parliament at the time showed that the object of the tariff was not only to increase the revenue but also to pave the way for a renewal of reciprocity with the United States, or still further for commercial union. The fixing of the Canadian tariff brought on a discussion of the subject with the United States; and the Canadian authorities obtained the consent of Great Britain for the opening of fresh negotiations. The British minister at Washington, Sir Edward Thornton, and Hon. George Brown, a Dominion senator, were accredited as joint plenipotentiaries to negotiate a treaty of fisheries, commerce, and navigation with the United States. The result of their labors, in conjunction with Secretary Hamilton Fish, was a treaty draft which was rejected by the U. S. Senate after having been approved by the governments of Great Britain, of the United States, and of Canada. The negotiators on the part of Canada had endeavored to make the new treaty very like that of 1854, but the U. S. government demanded that certain goods said to be common to both countries should be included, and the British negotiators acceded thereto. The list comprised articles imported from the United States to the amount of \$3,000,000 in 1878 and paying a revenue of \$500,000 to the Dominion. This provision was indignantly commented on by a portion of the Canadian press, which declared that reciprocal free trade in natural products had only been obtained "by the sacrifice of the manufacturing interests in addition to the fisheries." Hon. J. A. Garfield, then in the House of Representatives, declared himself, in 1880, in favor of a customs-union because a reciprocity treaty would always be a bone of contention between the political parties, and would not be satisfactory to the whole people.

Since 1885 the discussion of commercial relations with Canada has been revived; but the question has concerned a Commercial union rather than Reciprocity. The suggestion that the relation between the two countries should take the form of the Zollverein has received less favor for the reason that, if such a mutual arrangement were made without annexation, the fact would be apparent to all that it would be much more advantageous with annexation, but neither Canada nor the United States appears to be ready to take that step. The renewed discussion culminated in a bill introduced in Congress early in 1887, providing that as soon as the government of Canada should by act of parliament permit all articles of trade and commerce of whatever name or nature, whether the product of the soil or of the waters of the United States, or manufactured articles, live-stock of all kinds and its products, minerals and coal, the produce of the mines of the United States, to enter the ports of the Dominion free of duty, then all articles manufactured in Canada, and all products of the soil and waters, and all minerals and coal, the product of Canadian mines, and all other articles of every name and description produced in Canada, should be permitted to enter the ports of the United States free of duty. This act provided for absolute reciprocity of trade between the two countries as to all articles of whatever name or nature produced in either country. This reciprocity was to go into effect by the proclamation of the President whenever the Canadian Parliament and government had taken similar action, and the secretary

of the treasury with the proper officials of the government of Canada should make the necessary rules and regulations for the purpose of executing the provisions of this act, and at the same time protecting the two governments against the importation of foreign goods through either into the other. This scheme of commercial union proposed that a tariff uniform with that of the United States should be adopted by Canada against the rest of the world; but that between Canada and the United States there should be no tariff at all. The result would be that goods from Great Britain and all foreign countries would be met all over North America by a protective tariff, while the merchandise and manufactures of the United States would have free passage. The present Macdonald government of Canada opposed this Commercial union, and it continues to oppose it although it favors reciprocity. But the opposition (or Mackenzie) party favors the plan and it is sustained by such high authority as Prof. Goldwin Smith and Edward Atkinson. In the Dominion Parliament the scheme was thoroughly discussed early in 1888 and was defeated in April. It has naturally excited less interest in the United States, but it will undoubtedly be revived. (F. G. M.)

RECLUS, JEAN JACQUES ELISÉE, a noted French geographer, was born at Sainte Foy la Grande, Gironde, March 15, 1830, being the second son of a Protestant pastor. He was educated in Rhenish Prussia and at Montauban, and studied geography under Ritter at Berlin. He became familiar with most of the European languages. Leaving France on the establishment of the empire, in 1851, he spent five years in travelling through England, the United States, Central America, and resided for some years further in South America. His travels and researches furnished the subject of many articles in periodicals after his return to France. During the siege of Paris Reclus took part in the balloon observations. He had long held extreme democratic views, and he belonged to the Workingmen's International Association. In March, 1871, he joined the Commune, and on April 5 he was taken prisoner while making a reconnaissance. Although learned men interested themselves in his behalf, he was sentenced to deportation to New Caledonia, but in January, 1872, the sentence was changed to simple banishment. He went to Italy, but afterwards settled in Switzerland, and refused to return to France until complete amnesty was granted to the Communists. Beginning in 1860, with simple guide-books to London and the health resorts of the Mediterranean, he worked his way upward to his work on *La Terre* (2 vols., 1867-68), then his grand, splendidly illustrated work *La Terre et les Hommes* (12 vols., 1875-82). The last has been translated into English by Ravenstein and published both in London and New York under the title *The Earth and Man*. Three brothers of Elisée Reclus have been engaged in similar geographical works, and as many sisters have been active in translating works from German and English.

RECONSTRUCTION. The surrender of the armies of the Confederate States to the army of the United States, in 1865, terminated the active stage of hostilities between the belligerents, but did not fix the conditions of peace between them. By that act the territories of the Confederate States passed under the control of the military power of the United States. A state of war had existed through recognition by Congress, the only authority that could clothe the rebellion of the seceding States with that formal character. Without such recognition, in every act of hostility during the war the people of the Confederate States, so far as they individually took part in it, would have been liable to the penalties for treason against the government of the United States, and as they came under its control might have been subjected to the consequences of that act of treason. But the fact was presented to Congress that the people of those States were under the control of a power that they could

not resist as individuals, and to which the resistance to the authority of the United States was chargeable, and humane sentiment demanded that their governments, rather than their persons, should bear the consequences of accountability. If, however, the state of war was admitted to exist, the necessary implication would be that the seceding States had succeeded in actually separating themselves from political and civil relations to the United States, and were in the actual exercise of independent government over the territories to which that actual power extended, an act of war being necessary to reduce them to their former practical relation to the United States through conquest. Had Congress concluded to continue to treat the resistance of the seceding States as merely an act of rebellion, upon the suppression of that rebellion their status in the Union might have remained unchanged by the fact of that resistance. On the other hand, if a state of war should be properly recognized, that recognition would imply that, for the time being, they were a foreign power, for a state cannot make formal war with itself. With these considerations fully before it, Congress recognized the state of war as existing, and that was equivalent to a declaration that the law and consequences of war should characterize the relations of the parties until the act of making peace should create new relations between them. The laws of war thus displaced, for the time being, all other sources of right and obligation between the contending parties.

The title then by which the United States took military possession of the territories of the Confederate States was that of conquest, under the laws of war, as it had no other proprietary right to such territory. The war as such was directed against the governments of the Confederacy and of these several States composing it, and its proper object was the destruction of that governmental authority as inimical to the Constitution of the United States, and consequently it could be legitimately claimed at the successful termination of the war by the military authority of the United States; and until other methods of government were supplied by Congress, that the military authority was the only legitimate authority within the conquered territories. The action of the government of the United States in dealing with the territories of the Confederate States after the surrender of its armies was distinctly placed upon the principles just stated. It was deemed competent for the military authority to use the mechanism of the existing governments, and its officials found in place, or to change either, and that course was pursued by that authority. According to the principles of general law, recognized by the laws of war, the civil relations of the inhabitants remained unchanged, until modified by the military authority, while the political system that united the people for the purposes of government was for the time being dissolved. The military government of the territories of the former Confederate States was developed in accordance with the principles already stated, and continued to be actually exercised, although with diminishing rigor, until displaced by the State governments erected under the acts of reconstruction enacted by Congress.

The question of the restoration of civil and political order was one of great complexity and difficulty, and gave rise to grave dissensions that ultimately brought the President and Congress into conflict. There were two theories of the relative attitude of the Confederate and Constitutional States, one of which treated the former as unchanged in their relations to the Constitution by the facts of secession, war, and conquest, and the other regarded them as having placed themselves beyond the protection of the Constitution and as in a condition to be dealt with as in the case of other Territories of the United States.

Pres. Andrew Johnson, who had succeeded Pres. Lincoln at his death by assassination at the close of the war, entertained the view first stated. He regarded the States that had attempted secession as of

right in their former constitutional relations from the moment that their capacity to resist the laws of the United States was destroyed. Without authority derived from Congress for that purpose, he assumed to appoint provisional governors for the States recovered from secession. No provision existed in the laws of the United States for the appointment of such officers. All offices, according to the Constitution and laws of the United States, are created by Congress, where not previously created by the Constitution itself. The President has the power to fill the non-elective offices of the government, but subject to the approval of the United States Senate. No such office as a provisional governor of any Territory was provided for by law, and the appointment of officers for the States was clearly beyond the competency of the President. The appointment was made without the approval of the Senate, and before Congress had acted upon terms of pacification and restoration with the States that had been reduced by the military power of the government.

There were but two modes in which a state of war could be converted into one of pacific relationship—the one by the treaty-making power and the other by Congress—and neither of these modes had been applied by the President, for the former depended upon the assent of the Senate and the latter upon the action of Congress, and neither of these forms of assent had been given. If it be assumed that the treaty-making power can conclude conditions of peace independently of the legislative authority, which is alone competent under the Constitution to legalize the state of war, still it was properly claimed that such power was inapplicable to the case in hand, for although the Confederate States were for the purposes of war regarded as a foreign power still at the termination of hostilities, by the actual reduction of these States under the authority of the United States, this limited recognition could have no effect, and the question was simply one of dealing with territories acquired by conquest, which was rightfully claimed by Congress.

Under authority derived from the President alone, the provisional governors assumed to call upon the people of the States under military authority to send delegates to enact constitutions of government for such States. This power was regarded by Congress as being peculiarly within the scope of the legislative authority, and its exercise by an executive officer, without the authority or aid of the proper legislative body, as without precedent in this country. As the absence of a proper legislative authority within these States prevented the exercise of that power, Congress remained to be appealed to, and if the exigency demanded it, could have been convened for that purpose.

Conventions were held and the ordinances of secession were repealed and slavery abolished. In most of the States in which such conventions were held constitutions were framed, some of which were submitted to the people for ratification, while others took effect from the authority of the convention alone. The people who had been emancipated from slavery took no part in these conventions, nor were permitted so to do, notwithstanding they constituted a majority of the population of several of the States. Had the conventions been called in the manner provided by the previous constitutions of the various States so as to be affected by the provisions of such constitutions, the exclusion of the people of African descent could have been accounted for, but such was not the case. The conventions had no sanction under the antecedent constitutions, and if called in the manner attempted in the present instance during the vigor of those constitutions would have been considered irregular and revolutionary. They were in fact original efforts to construct a government unfettered by antecedent authority, and in accordance with American principles of government should have proceeded from the whole population. By these various constitutions the qualifications of the

elector were that he should be a free white person 21 years of age. The emancipated slaves were ignored and no political status given to them under those systems. Under these constitutions governments were organized and public officers chosen, and, but for the presence and unwillingness of the military authority to relinquish the duties imposed upon it until relieved by Congress, they would have gone into complete operation. The strange spectacle was exhibited of a complete civil system, organized under the authority of the national executive, suppressed by the military authority of which its author was the head and source.

The conflict was soon to be transferred, from the ground where an irregular civil authority was seeking to assert itself against the strong military arm, to Congress. Pres. Johnson in his annual message to Congress in 1866, after referring to the constitutional duties of the States, says, as follows: "But if any State neglects or refuses to perform its offices there is more need that the general government should maintain all its authority and as soon as practicable resume the execution of its functions. On this principle I have acted and have gradually and gently and by almost imperceptible steps sought to restore the rightful energy of the general government and of the States. To that end provisional governors have been appointed for the States, conventions called, governors elected, Legislatures assembled, and Senators and Representatives chosen to the Congress of the United States." Pres. Johnson in his message recognized the right of Congress to determine the qualifications of its members.

Both branches of Congress were by large majorities united in opinion and hostile to the method of reconstruction actually in course of execution under the authority of the President. In the first place the action of the President was regarded as an excessive exercise of the powers of his office and as an encroachment upon the authority properly belonging to Congress. Congress claimed to be the only constitutional power that could change the relations between the late belligerents from that which was brought about by the recognition of a state of war to one of political and civil restoration, and was resolved to sustain its proper authority against such encroachment. In the second place Congress deemed it just and wise that the conditions of reunion should be adjusted to the nature of the action that had broken the unity between the States, so as to express the true principles on which that union was based, and that such expression should not be confined to words but should appear in appropriate public action that should transmit to history the lessons of the war. It was thought that the mildest form in which, in the terms of pacification, the estimation by Congress of the wrong inflicted upon the nation could be appropriately expressed would be to disqualify certain of the leaders of secession from resuming their former political influence over the people of those States for such time as Congress should deem just and expedient. In the last place Congress recognized the fact that a large population existed in those States that had attempted secession having neither political nor civil status under the former laws of those States, and who, through the operations of the war, had been made freemen, and had the right to look to Congress to secure to them the proper consequences of freedom in the future constitutions of the civil society of which they should form a part.

In addition to these responsibilities to the Constitution, to the perpetuity of the Union, and to the persons whose condition had been radically changed by the eventualities of the war, there was another consideration of importance that affected the political balance in Congress itself. Should the former slave population be excluded from political participation in their respective States so that public authority

would remain exclusively in a portion of the population of those States, it was a vital political question whether the representation in the House of Representatives from such States should be accepted on the basis of the entire population of those States, or be limited to that portion of the population that was admitted to participation in its public authority. To accept representation on the basis of a population of which a large part was excluded from political authority was regarded as allowing disproportionate advantages as resulting from principles that were regarded by the remaining States as inconsistent with popular government.

The first practical action demanded of Congress by the attitude of affairs was to determine whether persons claiming to have been elected as senators and representatives under the constitutions deriving their authority from the action of the President should be admitted to those bodies. The power of Congress to determine the qualifications of its members was constitutional and undoubted and was conceded by the President. In the present case the exclusion of such persons as claimed election by the recently constituted States to representation in Congress was dependent upon the question whether the constitutions under which they claimed election were authoritative, for unless wanting in validity their right could not be properly denied. If the authority of Congress was needed to enable these States to recover their former places in the Union, it was equally needed to enable them to establish domestic government, for that government could only be habilitated as an integral part of the Union.

Acting upon these principles Congress excluded the representatives from those States and thus in effect declared that the method of reconstruction that had originated with the President was inconsistent with the Constitution. It became necessary then for Congress to initiate a plan for restoring those States to the Union and to prescribe the conditions of such restoration. Fundamental to such action was the question whether the States that had attempted secession were to be regarded as having deprived themselves of the constitutional rights common to the States of the Union in view of the concession that they could not without the consent of the remaining States escape from the obligations incident to such constitutional relationship. If it was possible for a State by denying its obligations to the Union to deprive itself of its rights under that Union, very clearly such a case had been presented in the act of secession and the inauguration of war against the United States. If the seceding States had lost their rights under the Union while their obligations remained unchanged, either the performance of an act of justice or the consent of the aggrieved party was essential to the restoration of such rights. If, however, the opposite view was taken that the States could not by any act deprive themselves of their rights under the Union, even though an act of secession and war intervened, then their independent right to reorganize their internal governments in their own way and to claim representation in Congress unconditionally could not be denied.

Congress was divided upon these questions, for although a great majority of both houses concurred in the view that these States had forfeited their constitutional rights without evading their constitutional obligations, yet a small but energetic minority maintained the opposite doctrine and were unrestricted in its expression. The position assumed in support of the action of the President and the right of representation of the persons elected under this authority was that it was impossible for a State to deprive itself of its status in the Union, whatever might be its conduct or hostility to the Union, and consequently that at the instant resistance to the Union ceased it was in a condition to assume all its rights and functions under the Constitution without any new condition being added to its ob-

ligations. This doctrine was opposed as having no sanction in the principles applied to either individuals or States, and in fact as subversive of the fundamental principles of justice according to which, as universally accepted, a legal relation may exist, and yet, through the conduct of those affected by it, be deprived of all its proper fruits and consequences, only to be restored on such conditions as are agreeable to justice or acceptable to the parties affected by its negation. It was contended that the principles of justice not only demanded compensation for repudiated obligations, but, as applied to vital relationship, such as government, demanded security for the future observance of such obligations, and that Congress could alone determine the character of the security demanded and include it in the conditions of restoration.

With a singular fatuity that often appears in the conduct of men and communities it was contended now, by those who had held to the right of a dissatisfied State to retire from the Union, that such secession was an impossibility, according to the nature of that Union, thus conferring upon rights a quality that only belongs to obligations, and ignoring the fact that the former are dependent on the facts of conduct, while the latter persist until dissolved by the act of those entitled to their benefit.

The conclusion to which Congress arrived as to its right to ascertain the conditions upon which restoration should depend opened for discussion the question of its proper terms and conditions. The prevailing opinion in Congress was that for some indefinite time some of the persons who had been most actively engaged in hostility to the Union should be excluded from participating in the exercise of public authority, Congress to retain in its own hands the authority to terminate this exclusion when in its judgment demanded by the public interest. This temporary expedient appeared to the majority in Congress to be called for both upon grounds of justice and prudence. War had been waged against the United States by a portion of its citizens, and the very question submitted to the arbitrament of arms was whether that act of war was an act of treason against the United States. One party claimed that it was in the exercise of a right inherent in the conditions of the Union that was unjustly resisted, while the other party insisted that the act was in violation of the allegiance due to the United States, and as such, taking the form of war, was an act of treason against that government. The acknowledgment of the existence of belligerent relations, if it did not legally shield the actors in rebellion from the consequences of an act of treason as to acts done after that recognition, had that effect practically. The termination of the war established the view entertained by the Union and upon which it was conducted, and left those who participated in hostility against the Union in the attitude of having violated their allegiance to the United States. The question of the sincerity of the convictions of those engaged in the war in opposition to the Union being one of morals, could not enter into the legal and practical solution. To restore at once and without probation those whom the war had placed in this attitude to the exercise of the highest public authority of the nation seemed to the majority in Congress as equivalent to a declaration that either the violation of allegiance to the United States was not an act deserving of severe condemnation, or that the surrender of the armies in the field was an act that obliterated the consequences and the memory of past actions and conferred a new civil quality upon those by whom it had been performed.

The majority in Congress also hesitated to commit the people who had been raised from the condition of slaves through the eventualities of a war brought on by the desire to hold them in perpetual slavery to those who had sought to destroy the Union for the sake of perpetuating their slavery. The majority regarded Congress as bound by every consideration of

duty to those who had received freedom through the consequences of war to make provision for their future welfare as far as could be consistently done in the dispositions relative to reconstruction. The responsibility of having removed from the interested protection of private owners some four millions of people, separated widely from the residue of the population by race and condition, could produce no other effect upon Congress. The future of these people, in view of their great numbers and the absence of the conditions for unitizing them with the surrounding populations in a homogeneous society, presented a problem of the greatest gravity. It was apparent that little consideration had been given in the States that had undertaken their own reconstruction under the presidential auspices to this important subject, for the constitutions that they had framed confined the electoral rights to free white persons and ignored the existence of a vast population without political recognition. The American people had not faced the problem of such exclusion from political right on a scale of magnitude that challenged attention to the principles involved, and were for the most part habituated to the practice of giving to all of domestic birth who mingled in their populations electoral privileges as essential to the protection of individual liberty, and had most liberally extended that right to foreign-born persons seeking their communities.

Notwithstanding the conferring of political as well as civil privileges upon the emancipated slaves was the natural outcome of American doctrine and practice, yet Congress felt the gravity of the question of conferring political rights upon the vast body of emancipated slaves before they were prepared to intelligently exercise such privileges, and felt disposed to leave the solution of that problem by gradual steps to the States most immediately interested in the results of such policy, but under conditions that would be likely to induce a liberal exercise of the power of extending the elective franchise to these people. The Southern States had always placed a high estimate upon the value of a full representation in the national House of Representatives, and had in the framing of the Constitution of the United States secured a provision by which five slaves were to be enumerated as the equivalent of three free white persons in the basis of computing the extent of their rights to representation. It appeared to the majority in Congress that if the representation in Congress of the States undergoing reconstruction was limited in proportion to the exclusion from electoral rights of portions of their populations on the ground of race and former condition of slavery, that a sufficient motive would arise out of the desire for increased representation in Congress to induce a liberal treatment of the question of conferring political rights upon the emancipated slaves. The policy just indicated was finally embodied in Amendment XIV. to the Constitution.

This amendment, proposed by Congress on June 16, 1866, declared as citizens all persons born or naturalized in the United States, and prohibited the States from depriving any person of life, liberty, or property without due process of law, or denying to any person within their jurisdiction the equal protection of the laws. It declared that representatives should be apportioned, counting the whole number of persons in each State, excluding Indians not taxed. It provided that where the right to vote for any office of the United States or a State was denied to any male inhabitant, except for participation in rebellion or other crime, the basis of representation should be reduced in proportion to the number of such excluded citizens to the whole number of male citizens of 21 years of age in such State. It declared that no person shall be a Senator or Representative in Congress, or elector of President or Vice-President, or hold any office, civil or military, under the United States, or under any State, who having previously taken an oath, as a member of

Congress, or as an officer of the United States, or as a member of any State Legislature, or as an executive or judicial officer of any State, to support the Constitution of the United States, shall have engaged in insurrection or rebellion against the same or given aid and comfort to the enemies thereof. It also validated the public debt of the United States and excluded the payment of claims on account of the rebellion or for the emancipation of slaves.

This amendment was intended and proposed as a final act of pacification and restoration, which, if ratified by the requisite number of States so as to become part of the Constitution of the United States, would leave to the States that had participated in the rebellion entire freedom in constructing their domestic governments. As it regarded the civil rights of the emancipated slaves it went no further than the constitutions adopted by those States under the call of their provisional governors had gone. As it regarded the political rights of the emancipated slaves, all was left to the discretion of the States under the influence of the motive to liberality arising from the opportunity of enlarging their representation in Congress by conferring electoral rights upon the former slaves. The exclusion of those who had participated in the rebellion was limited to those who had held official positions in the United States and in the States, and who were presumably of leading influence in the States, and had had the advantages of official position to enhance that influence, and thus were to some extent responsible for the public policy of the States that led them into rebellion. But these exclusions could be removed by Congress, and, as the sequel will show, were intended to be removed by Congress as soon as the main objects of reconstruction should be accomplished. The remaining provisions of the amendment were such as were to be anticipated under the circumstances.

The amendment was promptly rejected by Georgia and North and South Carolina and ratification withheld in all the other States participating in the rebellion, except Tennessee, which promptly ratified it. It was thus evident that the States directly affected by the provisions of the Fourteenth Amendment would not accept the tender made by Congress and that some other course of action was a necessity of the case.

It is necessary here to refer to legislative action that both preceded and followed the discovery that nearly all the States that constituted the Confederacy were unwilling to assent to the terms of pacification and reconstruction propounded by Congress. By an act passed April 9, 1866, Congress ascertained the civil status of the emancipated slaves, declaring that all persons born in the United States, not subject to any foreign power, other than Indians not taxed, were citizens of the United States entitled to the equal protection of the laws. Authority was conferred upon the judiciary of the United States to enforce the rights thus recognized. This act was the first instance in which the national legislature gave effect to the declaration that permeates all the utterances of fundamental truths that have been accepted as the basis of our national system, that "All men are born free and equal," a form of expression that would have been more exact if the statement had been that all men are born to be free and equal. But this declaration was only the partial embodiment of this fundamental truth, for it extended only to the civil status of American-born persons and left the political status still lacking in homogeneity, and was subject to the doubt whether its provisions could extend beyond the States actually reduced by the arms of the United States.

Amendment XIII. to the Constitution, that abolishes slavery within the United States, had previously been proposed to the States and was proclaimed as ratified Dec. 18, 1865, but did not have the effect to ascertain the civil status of the emancipated slaves, although it dissolved all subsisting relations of master

and slave throughout the United States. The declaration of equality of civil right to all native-born persons, as made by Congress, was of limited effect and could be unmade at any subsequent time by the same authority, and hence it was necessary, in order to place it upon an enduring basis, that it should become part of the Constitution of the United States. In part for the accomplishment of this object Amendment XIV. to the Constitution, which has already been discussed, was passed for submission to the States in June, 1866. As already stated, Tennessee was the only State of those that participated in the rebellion that promptly ratified this amendment, and thus having accepted the terms of pacification and reconstruction tendered by Congress, was, on July 24, 1866, by a resolution of Congress, admitted to its former place in the Union and to representation in Congress.

Congress having thus definitely fixed the terms upon which States and individuals who had participated in the rebellion should be admitted to full privileges under the Constitution, and deeming it wise to place beyond the executive authority any alteration of or interference with these terms, withdrew from the President power conferred upon him in 1862, enabling him by proclamation to extend to persons who had participated in the rebellion pardon and amnesty. A failure of all the States that had formed the Confederate government, except Tennessee, to accept the terms of pacification and reconstruction tendered by Amendment XIV. was, in the judgment of Congress, ground for placing those States under some definite régime. What civil authority existed in them was in the form in which it was placed by the constitutions adopted under the sanction of the provisional governors, while the actual governmental control was in the hands of the military authority of the United States, notwithstanding such civil authority as existed in those States was there under the sanction of the President, and the military establishment by which that civil authority had been practically displaced was under the supreme control of the President. To solve this conflict of jurisdiction, Congress on March 23, 1867, passed an act to provide for the government of the rebel States.

This act declares that no legal governments existed in Virginia, North Carolina, South Carolina, Georgia, Mississippi, Alabama, Louisiana, Florida, Texas, and Arkansas. It divides those States into military districts and provides for the assignment of military officers to their command, placing them under the military authority. The military authority was to extend to the protection of rights of person and property, the suppression of insurrection, disorders, and violence, and to the punishment of disturbers of the public peace. Military courts were authorized and all interference by State authority declared null and void. Authority was conferred upon the enumerated States to form constitutions and choose Senators and Representatives in Congress, and it was declared that such States should be readmitted to the Union and their Senators and Representatives to seats in Congress, when certain conditions should be complied with. These conditions were as follows: The constitution should conform to the Constitution of the United States; it should be framed by delegates chosen by a majority of the votes of the people of the States having the electoral qualifications prescribed by that act; it should be ratified by the same authority; it should be approved by Congress; that no person excluded from office by Amendment XIV. should be eligible as member of the convention to form such constitution or vote for the same or hold office thereunder; that such State should ratify Amendment XIV.; that the admission of the State and of its Senators and Representatives to seats in Congress should take effect when that amendment should be ratified and become part of the Constitution of the United States. The qualification of voters prescribed in the act were that all male citizens of 21 years of age and upwards, of

whatever color or previous condition, who had resided one year in the State, should be entitled to vote, except where disqualified for participation in rebellion or for felony at common law. The act further declared all civil authority within the State prior to admission provisional and subject to the military authority.

By the act just mentioned Virginia constituted the First Military District, North and South Carolina the Second, Georgia, Alabama, and Florida the Third, Mississippi and Arkansas the Fourth, and Louisiana and Texas the Fifth Military District. The President assigned to the command of the respective military districts, Maj.-Gen. J. M. Schofield to the First, Maj.-Gen. D. E. Sickles to the Second, Maj.-Gen. G. H. Thomas to the Third, Maj.-Gen. E. O. C. Ord to the Fourth, and Maj.-Gen. P. H. Sheridan to the Fifth. Maj.-Gen. Thomas was at his own request, on the 15th of March, 1867, relieved from the command of the Third Military District and Maj.-Gen. John Pope assigned to that command.

The second proposed measure of pacification and reconstruction was distinctly made to the enumerated States and was rejected, or rather wholly neglected. As the former action by Congress had established the civil status of the emancipated slave, at least in all those States that by engaging in rebellion had lost the immunities secured by the Constitution, the last-mentioned measure sought by the voluntary acceptance of those States to place his political status on terms of equality with all other citizens of the United States. The plan of leaving the definition of those political rights to the interested States under the influence of a motive that might lead them to deal liberally with it having failed, the solution of that grave question was placed distinctly upon Congress. Seldom in the history of nations has so grave a responsibility fallen to the lot of a legislative body. It has been assumed from the foundation of the government that all native-born male persons subject to the authority of the United States as citizens thereof, except such as were held in legal slavery, were, unless affected by crime, entitled to equal participation in the exercise of all civil and political rights. This conclusion was derived from principles that were regarded as fundamental to our system of government, and were declared in all our constitutions and public utterances. The fact that if the slave was emancipated citizenship and electoral privilege would be necessarily conceded to him was one of the arguments against emancipation. That contingency had occurred, the slave having been emancipated, and the question was pressed home upon Congress whether any just ground existed for excluding the emancipated slave from that which under our institutions was the logical and reasonable consequence of his emancipation. Was it sufficient to say that it might tend to public inconvenience in some of the States that had fostered the institution of slavery to such an extent that the majorities of their populations were emancipated slaves? If the white citizens should be in the majority, the anticipated difficulty would not be serious; if, on the other hand, the emancipated slaves constituted the majority of those populations, the question of expediency was confronted with one of principle, whether on grounds of inconvenience the majority may be consistently disfranchised to relieve the minority from inconvenience. Such had never been the practice of our country and the case was a new one. If Congress, having the power to fix the political status of the emancipated slave, should, after removing from him the protection afforded by the interested protection of the slave system, decline to extend to him the equal protection of the laws, its only answer to the question as to the reason of such course would have to be either that the emancipated slave was uninformed and unskilled in the art of life and government or that he was an African. The first of these responses would contradict the principles on which popular governments are founded, while the latter would be accepted by no en-

lightened people on earth. Congress was confronted by the fact that the former owners of these people, to whose grace they would be committed in the event that political rights were denied them by Congress, were unwillingly deprived of their slaves by the eventualities of a war waged for the very purpose of perpetuating the condition of slavery, and regarded that deprivation as an act of great injustice. As their former masters held that the rights in society that appertain to the white man have no application to the black man, Congress hesitated to assent to surrender the career of those upon whom it had conferred liberty as their due according to the same principles that form the title to the white man to liberty, to those who held opinions and sentiments diametrically opposite to these. In view of the considerations of State prudence respected by all governments Congress hesitated to disfranchise a population that had every motive to be loyal to the nation as the author of their liberty, and to commit the reins of government to those exclusively who sought the dismemberment of the nation. It has been said that on grounds of expediency Congress erred in the judgment that produced these measures of reconstruction, but the important question is whether the consideration of expediency was open to Congress in a case where the principles of liberty were at stake, and where it had placed itself in an attitude to the emancipated slave that implied a large measure of governmental protection to his condition, present and future. The solution offered by Congress to the grave questions thus presented was sustained by the opinion of the great majority of the people of the loyal States, and whatever may be said of the expediency of its policy will command respect for its sincerity of purpose and justice.

The failure of the former slave States to accept the terms thus offered called for further action on the part of Congress, and the acts known as the Reconstruction Acts of Congress were passed, the first upon March 23, and the second on July 19, 1867. The first of these acts was a modification of the previous act providing for the government of the rebel States. It provided for a registration to be made in each of the States there enumerated under the authority of the military officers assigned to them, which should include the emancipated slaves with all other classes, excepting only such persons as had been disfranchised by previous acts. As the exact bearing of this act upon disfranchisements on the ground of aiding in the rebellion was in doubt, the second act of reconstruction was passed to remove such doubt. The persons excluded for participating in the rebellion were declared to be persons who, having been members of the Legislatures or of the executive or judiciary of any of these States, had engaged in the rebellion, whether such complicity arose while holding such offices or at a later time.

Under these reconstruction acts registration of the voters of those States who possessed the requisite qualifications was made; elections were called for the choice of delegates to conventions to frame constitutions for such States; conventions were held and constitutions framed that were submitted to the vote of the people of the States who had the proper qualifications as voters and were ratified. The State offices were filled by election, the Legislatures convened, and the governments were placed in operation. The new State governments promptly adopted Amendment XIV. and at once were admitted to representation in Congress.

During the proceedings in the Second Military District under the acts of reconstruction, Gen. Sickles was relieved in August, 1867, and Maj.-Gen. E. R. S. Canby assigned to the command. In December of that year Gen. Pope was relieved from the command of the Third Military District and Maj.-Gen. G. G. Meade assigned to that command. On July 28, 1868, the military government of the Second and Third Military Districts was terminated, the States composing those

districts having fully complied with the acts of reconstruction. Gen. Schofield was relieved in 1868 from the command of the First Military District, having been made Secretary of War, and Maj.-Gen. G. Stoneman assigned to that command. Virginia, which constituted that district, was not admitted to the Union until 1870. A constitution, formed at Alexandria in 1864 by delegates that were within the military lines of the United States, had not been submitted to the people for ratification. A constitution was framed in 1868 under the acts of reconstruction, but was not submitted to the people until July, 1869, a special act of Congress having been passed for that purpose in April, 1869, when it was ratified and the State admitted in 1870.

Gen. Ord was relieved in December, 1867, from the command of the Fourth Military District, and Maj.-Gen. I. McDowell assigned to that command. Gen. McDowell was relieved in June, 1868, and Maj.-Gen. A. C. Gillem assigned to that command. Mississippi, one of the States of this district, ratified the constitution framed under the reconstruction acts in December, 1868, that constitution having been previously submitted to the people in June of that same year and rejected. Prior to the ratification by Mississippi Arkansas, also in that military district, had ratified her constitution.

Gen. Sheridan was in August, 1867, relieved from the command of the Fifth Military District and the command at first assigned to Maj.-Gen. G. H. Thomas, but soon after to Maj.-Gen. W. S. Hancock. The latter was relieved in March, 1868, and was succeeded by Maj.-Gen. J. J. Reynolds. Louisiana, one of the States of this district, ratified the constitution passed under the reconstruction acts in August, 1868. In July of that year the Fifth Military District was confined to Texas, under the command of Gen. Reynolds. This State finally ratified its constitution in March, 1869, and was readmitted to the Union in March, 1870.

It will be observed that by the final conclusion of Congress the disfranchisement within the States on the ground of participating in rebellion was limited to the case of those who had held office under the United States or in any of those States and while holding such office or afterwards had engaged in the rebellion. The mere fact that a citizen of those States had taken part in the rebellion, even if that part was an important and conspicuous one, did not produce disfranchisement. The class thus temporarily separated from a controlling influence over the new State governments were presumably those who in former years had shaped the policy of the State, and were the responsible authors of the attempt to destroy the Union of the States. To select them personally would have been invidious and might, from erroneous information, have worked injustice in individual cases. To place them in a numerous class that would necessarily include the active agents of rebellion seemed to Congress to be the only mode of distinguishing between the authors of secession and those who had followed them, whether voluntarily or by compulsion, that was not open to serious objection.

The Congressional reconstruction had the effect to write into the constitutions of the States upon which it acted the language of liberty and equality as it had been framed through the revolutions of England and perfected in America, and thus to exhibit an entire unity in the principles upon which government was administered among all the States of the Union. That Congress did not intend that the consequences of rebellion should be perpetuated in the disfranchisement of those engaged in it beyond what appeared to that body to be necessary to give to the new governments of the former slave States principles and forms in harmony with the general institutions of the country was abundantly evidenced by the readiness and rapidity with which the disfranchised were relieved from their disabilities after the habilitation of the States.

See Wilson's *History of Reconstruction, 1865-1868*; McPherson's *History of Reconstruction, 1865-1870*. In this work see SLAVERY, SECESSION, and CONFEDERATE STATES. For discussion of the constitutional questions involved in Reconstruction, see Bishop's *Criminal Law* (4th ed., vol. 2, sec. 1224 *iz. note*). (A. J. W.)

REDFIELD, ISAAC FLETCHER (1804-1876), jurist and author, was born in Wethersfield, Vt., April 10, 1804. After graduating at Dartmouth College in 1825, he became a lawyer at Derby, and afterwards at Windsor, Vt. In 1835 he was made a judge of the Supreme Court, and in 1852 became chief-justice. In 1858 he was appointed professor of medical jurisprudence in Dartmouth College. In 1861 he removed to Boston and in 1867 was sent by Secretary Seward to Europe as special counsel to recover for the U. S. government the property of various kinds which had been held in the name or on behalf of the Southern Confederacy. Two years were spent in this work, with profitable results to the government. Judge Redfield died at Boston, March, 1876. His chief publications are *The Law of Railways* (1857); *The Law of Wills* (3 vols., 1861); *The Law of Carriers and Bailment* (1869); *Leading American Railway Cases* (2 vols., 1870). He was also one of the editors of the *American Law Register*, and edited several standard legal works.

REDGRAVE, RICHARD, English painter, was born in London, April 30, 1804. In his youth he was employed in making designs for his father, who was a manufacturer, but in 1826 he began to study at the Royal Academy. His first success was a picture exhibited at the British Institution, *Gulliver on the Farmer's Table*. In 1838 his merit was first recognized by the Academy when he exhibited *Ellen Orford*, and in 1840 he was elected an associate. Among his works in the succeeding years were, *The Poor Teacher*; *The Sempstress*; *The Governess*; *Sunday Morning*. In 1846 he turned more to landscapes and exhibited *Happy Sheep*; *The Evelyn Woods* (1850); *The Forest Portal* (1853); *An Old English Homestead* (1854). In 1851 he was elected an academician, and in that year exhibited *The Flight into Egypt*. He joined with Henry Cole (*q. v.*) in forming a museum of ornamental art, which eventually was enlarged into the South Kensington Museum. He had charge of the display of British art in the Paris Exhibition of 1855, and a few years later was made by Queen Victoria surveyor of crown pictures, which position he held twenty-two years, resigning in 1880. Among his pictures produced in this period are *Startled Foresters* (1874); *Starting for a Holiday* (1875); *Calling the Sheep to Fold* (1876); *Well-spring in the Forest* (1877); *The Heir Come of Age* (1878). He also joined with his brother in preparing *A Century of Painters* (1866), which gives a history of British art since Hogarth.

RED JACKET, or **SA-GO-YE-WATHA** (1751-1830), Indian chief of the Wolf tribe of the Senecas, was born at Old Castle, near the foot of Seneca Lake, N. Y., in 1751. His Indian name given above means, "He keeps them awake," and was assumed on his attaining the dignity of a sachem. His name "Red Jacket" was derived from a richly embroidered scarlet jacket, the gift of an English officer, which he took great pride in wearing. In youth he was remarkably fleet of foot, and was often employed by his own people, and, during the Revolutionary war, by the British officers on the border as a scout and courier. On the death of Brant (*q. v.*) Red Jacket became the leading man among the Six Nations. In 1784, at a council held at Fort Stanwix to negotiate a treaty for the cession of lands, Red Jacket spoke eloquently in opposition to it, but it was nevertheless ratified. In 1792, on the conclusion of a treaty of peace between the United States and the Six Nations, Washington presented him with a silver medal which he ever after held in high esteem, and which is now

(1889) the property of Gen. Ely S. Parker. In 1809 he gave information to Erastus Granger, the Indian agent, of attempts by Tecumseh to draw the Six Nations into the Western combination, and in 1810 he visited Washington and delivered an eloquent speech on the subject to the Secretary of War. In the war of 1812 his counsel was often of essential service to the American army, in particular on the eve of the battle of Chippewa. In 1829 he passed through New York on his way to Washington, and while in the former city sat for his portrait to Robert W. Weir. Although then in his 78th year he was still hale and vigorous. In his later years he was grossly given to drinking, but was able to restrain himself on great occasions, as before a council. He was implacable in his hostility to Christianity and to missionaries, and despised the white man—his dress, speech, and customs. His character was marked with strange contradictions. Largely destitute of physical courage, he yet possessed tenacity of purpose and great moral resolution. As a statesman he was sagacious; as an orator, of surpassing eloquence. Yet he could descend to the meanest expedients of the demagogue. In all circumstances, however, he was a patriot and loved his nation, whose extinction he prognosticated but strove to avert. His form was tall and erect, his walk dignified, and his oratory, particularly in council, almost majestic. He died at Seneca Village, near Buffalo, N. Y., Jan. 30, 1830. His *Life* has been written by W. L. Stone (1867). (J. H.)

REDPATH, JAMES, journalist, was born at Berwick-in-Tweed, England, in August, 1833. At the age of fifteen he was brought by his parents to the United States. They settled in Michigan, where the son became a printer, and afterwards editor of a newspaper. He was Kansas correspondent for the *New York Tribune* during the troubles connected with the settlement of that State. He afterwards went to Hayti, and on his return acted as emigration agent for the Haytian government. During the civil war he was actively engaged as correspondent, and also exerted himself in behalf of the emancipated slaves. After the war he was superintendent of education at Charleston, S. C., and founded schools and an orphan asylum for colored children. In 1868 he established a lyceum bureau at Boston, and he has since been actively engaged in supplying lectures as well as in journalism. He has published several books relating to different stages of his career, and a *Life of Captain John Brown* (1860).

RED WING, a city of Minnesota, the county-seat of Goodhue co., is on the right bank of the Mississippi River, below the mouth of Cannon River, 41 miles from St. Paul by railroad and 58 by river. It is on a plateau, enclosed by high bluffs. It has a court-house, national bank and other banks, opera-house and music-hall, 15 churches, a high-school and other schools, and 1 daily and 2 weekly newspapers. There are flour-, saw-, and planing-mills, and manufactories of furniture, agricultural implements, wagons, and shoes. In 1880 it had a population of 5876.

REDWOOD. See **SEQUOIA**.

REED, SIR EDWARD JAMES, English naval architect, was born at Sheerness, Sept. 20, 1830. He was educated at the naval school at Portsmouth, and was afterwards employed in the dockyard at Sheerness. He became editor of the *Mechanics' Magazine*, secretary of the Institution of Naval Architects, and chief constructor of the British navy. He designed several iron-clads, including a frigate for the Turkish navy. He also built steam-transports for India, and numerous smaller vessels. He resigned in 1870, and engaged in private business. He was elected to Parliament in 1874, and represented the Pembroke boroughs until 1880, when he was returned for Cardiff. He had in the meantime visited Japan, at the request of the Imperial government, and on his return published *Japan: Its History, Traditions and Religions* (2 vols.,

1880). During Mr. Gladstone's brief administration in 1886 Sir Edward Reed was Lord of the Treasury. He has been a member of various committees to investigate subjects connected with naval affairs. His works on *Practical Shipbuilding*, *Iron-clad Ships*, and *Coast Defense*, are of high value.

REED, JOSEPH (1741-1785), patriot, was born at Trenton, N. J., August 27, 1741, graduated at Princeton in 1757, and studied law at the Temple, London. In 1767 he was appointed deputy secretary of New Jersey, and while on a visit to England in 1770 he married Esther, daughter of Dennis de Berdt, the agent for Massachusetts. On his return he settled in Philadelphia, and kept up a correspondence with Lord Dartmouth, English Colonial Secretary. He was a member of the committee of correspondence in 1774, and President of the Pennsylvania Convention in 1775. He was elected a delegate to Congress, but accompanied Washington, at his request, to Cambridge, as his secretary. In 1776 he was adjutant-general, and in 1777 was named brigadier-general by Congress, but declined, though he served at Brandywine and other battles as a volunteer. Bancroft, on the strength of a report made by Count Donop in 1776, charges Reed with disaffection to the patriot cause. On the other hand, Reed is reported to have replied to offers from British peace-commissioners: "I am not worth purchasing, but such as I am, the King of Great Britain is not rich enough to buy me." He certainly exposed the misconduct of Benedict Arnold in Philadelphia, and had him brought to trial. He was President of Pennsylvania in 1778, and was active in suppressing the mutiny of the ill-paid soldiers in 1781. He died at Philadelphia, March 6, 1785. Both his grandsons wrote his *Life*, Henry in Sparks's *American Biography*, and William more fully with his *Letters* (2 vols., 1847), in order to vindicate his character against the attacks of Bancroft in his *History of the United States*. The latter defended his position in an essay, *Joseph Reed* (1867).

His grandson, HENRY REED (1808-1854), was born at Philadelphia, July 11, 1808. After graduating at the University of Pennsylvania in 1825, he studied law with John Sergeant, but in 1831 was called to a professorship in his *alma mater*. He was a devoted student of Wordsworth, and edited the first complete American edition of his *Poems*. In 1854 he visited England, and on his return voyage went down at sea in the steamer *Arctic*, Sept. 27, 1854. He had edited various historical and poetical works of English authors. Of his lectures his brother afterwards edited *English Literature* (1855); *English History, Illustrated from Shakespeare* (1856); and *British Poets* (1857).

Another grandson, WILLIAM BRADFORD REED (1806-1876), born June 30, 1806, graduated at the University of Pennsylvania in 1822, and became Attorney-General of Pennsylvania in 1838. After a successful career at the bar, he was sent as minister to China in 1857, and negotiated a treaty with that nation. After his return, he was strongly opposed to the war for the Union, lost his fortune and law practice, and became a journalist. During the civil war he was for a time the American correspondent of the *London Times*. He died at New York, Feb. 18, 1876. Besides various books and pamphlets in defence of his grandfather, he published *World Essays*; *Among My Books*.

REES, ABRAHAM (1743-1825), a British educator and encyclopædist, was born at Llanbrynmaur, Wales, in 1743. He was educated for the Presbyterian ministry, and was for over twenty years tutor in the Hoxton academy. In 1768 he was ordained also pastor of a Presbyterian church in Southwark, London, and after holding this post fifteen years, took charge of another congregation. In 1786 he became principal of an academy at Hackney. In that year he completed an edition of Chambers' *Cyclopædia*, on which he had been engaged for ten years. His wide learning and

scientific attainments procured for him fellowship in the Royal Society and the Linnæan Society. In 1802 he commenced the *Cyclopædia* which is known by his name, and completed it in 1819 in 45 volumes. This able work was soon reprinted in Philadelphia. Dr. Rees died June 9, 1825.

REEVE, TAPPING (1744-1823), lawyer, was born at Brookhaven, L. I., October, 1744. He graduated at Princeton College in 1763, and settled at Litchfield, Conn., in 1772. There he practised law and soon had as a student and an inmate of his family Aaron Burr, whose sister he had married. Burr left him for the more adventurous career which the army offered. In 1784, when peace was established, Reeve instituted the Litchfield Law School, whose reputation soon spread to other States. Until 1798 he gave all the instruction himself, but then being made Judge of the Superior Court of Connecticut, he called an assistant to his aid in the school. Reeve held liberal ideas, and was the first lawyer of eminence to urge reform in regard to giving married women control of their property. He published the *Law of Baron and Femme*; *Parent and Child*, *Guardian and Ward* (1816). He died at Litchfield, Dec. 13, 1823. After his death his treatise on the *Law of Descents* appeared.

REFORMATORIES AND REFORMATORY METHODS. The term Reformatory, within the purview of this article, has reference solely to such prisons, or places of detention for persons, convicted of offences against the criminal laws as are set apart for the express purpose of making the reformation of their inmates the main object of their creation.

Reformatories are of three classes: (1) for adult criminals convicted of felonies, of which the reformatory at Elmira, N. Y., is a typical specimen. Any prison may be reformatory in its aims, and all modern prisons, perhaps, have reformation in view more or less, but convict prisons designated as reformatories are such as are specially set apart for the reception of young men convicted of their first offence, and who are considered corrigible by the court in which they are convicted and sentenced.

(2.) For adult criminals convicted of offences less than felony. This class includes houses of correction and workhouses.

(3.) For criminal youth. This class includes all institutions for the care of juvenile offenders convicted of violations of the criminal laws.

Orphan asylums, children's homes, and other institutions for the care of dependent children, who are simply unfortunate and not criminal, are not reformatories any more than Sunday-schools or day-schools, and should not be included in the same category. It is true, children entirely innocent of any criminal conduct are often found in reformatories, but their commitment to such institutions is a wrong which ought not to be permitted. Reformatories are for persons who have attained the age of legal responsibility, and who have been convicted of actual violations of law, and their presence there necessarily imposes a taint which society has no right to impart to such as are innocent or irresponsible, and to do so is to perpetrate a crime against childhood. Institutions for the care of dependent children are of the highest value, and for the prevention of crime their usefulness cannot be exaggerated, but they are not, in any penological sense, reformatories.

The reformation of criminals, whether old or young, as a proper object of governmental action, is an idea of comparatively recent origin. In the treatment of offenders, for the repression of crime, the dominant idea of the world has been deterrence by severity. An eye for an eye; tooth for tooth; life for life, has been the established formula of belief, and to a large extent this idea still prevails, but happily, as Christianity broadened the influence of its teachings, and experience demonstrated the efficiency of its regenerating

power upon the lives of men, it began to dawn upon the minds of legislators that even to prisoners kindness, sometimes, might be better than cruelty. The first reformatory, however, actually established, as such, by governmental action, was the prison of St. Michael at Rome, in 1704, by Pope Clement XI., and was for boys and young men. It was conducted upon a system similar to what is now known as the "Auburn system"—that is to say, of separate cellular imprisonment by night and silent associated labor by day—and its success was conspicuous and continuous. Howard visited it and praised it as one of the few prisons in the world worthy of commendation. He found over the prison door this inscription: "Clement XI., Supreme Pontiff, reared this prison for the reformation and education of criminal youths, to the end that those who, when idle, had been injurious to the state, might, when better instructed and trained, become useful to it." Within the prison, on a marble slab inserted in the wall, he found this (as he terms it) admirable sentence: "It is of little use to restrain criminals by punishment, unless you reform them by education." As a general principle in the care and discipline of young criminals, this golden sentence from Pope Clement XI. must commend itself to all right-thinking people, and in the requirements of modern penology no prison should be tolerated which does not make the reformation of its inmates a leading object. In fact, to discharge a criminal without reformation is to defeat the only object (the protection of society) for which imprisonment is justifiable.

For sixty years St. Michael's prison at Rome found no imitators in its reformatory purpose and methods, but finally, in 1775, another prison, similar in character and purpose, was established at Ghent, which soon became a model for all Europe, and was recommended as such by Howard, who visited it in 1776, and again in 1778. In fact, Howard found at Ghent, in successful application, nearly all the great principles of modern penology. They were: (1) Reformation as a primary end, with hope as a great regenerating force. (2) Industrial labor with a variety of trades to prepare prisoners for self-support. (3) Education, religious and literary. (4) Abbreviation of sentence and a participation in earnings as incentives to diligence, obedience, and self-improvement. (5) The exclusion of cruel bodily inflictions as a means of maintaining discipline, and the enlistment of the will of the criminal in the work of his own moral regeneration. In fact, as a reformatory prison it has rarely been equalled since, and it still remains a noble monument to the genius and humanity of Viscount Vilain XIV., under whose inspiration and influence it was established. Through its example all prisons in Belgium are now distinctively reformatory in purpose and character, and other Continental countries are adopting similar methods.

Under the British government the first prisons conducted on reformatory ideas were those of Ireland, where the system of classification and parole was established by Captain Crofton (now Sir Walter) in 1854, and which is now known as the "Crofton system." (See CROFTON.)

In England, through the legislation of 1877, unifying prisons and centralizing their supervision, the whole prison system has been made reformatory in purpose, and the steady reduction of crime throughout the kingdom clearly indicates its efficiency.

In the United States there are no convict prisons under State care without some reformatory agencies. In all religious services are held upon the Sabbath day, either by a resident chaplain or some clergyman from the outside. In the majority of these prisons flourishing Sunday-schools are maintained, chiefly through the efforts of volunteer workers from outside; and in quite a number weekly prayer-meetings are held, in which the prisoners take an active part. There are also, in some prisons, night-schools, in

which prisoners have some educational opportunities, and probably in all prisons there is some kind of a prison library.

In recent years, however, a few prisons of this class have been organized and specially designated as reformatories, and have for their primary object the reformation of criminals. Of these the New York Reformatory, at Elmira, is the pioneer and most conspicuous example. Prisoners received at Elmira are such as are convicted of their first offence and are under thirty years of age, and are held under what is known as the indefinite or indeterminate sentence.

The prisoners are classified in three grades, and all prisoners enter the second grade, with liability to fall to the third grade for misconduct, or they may rise to the first grade by good conduct. Promotion to the first grade is by earning 3 marks for 6 months in, or nearly in, succession. The marks are earned, 3 for demeanor, 3 for labor, 3 for school progress. After entrance to the first grade, six months more of good performance is required under somewhat enlarged liberties, when, if there is confidence and employment, the inmate may go out on parole. Six months of good record on parole usually secures from the managers an absolute release. Under a similar system of marks the prisoner may fall into the third grade, but by good conduct he may work back into the second grade, and thence to the first, and thence to parole. Each grade has a uniform peculiar to itself, and the prisoners, as they advance, have more privileges and better fare. The average period of detention is about two years and a half. If found incorrigible, the prisoner is transferred to Sing-Sing or Auburn to serve out the maximum of his sentence.

The Elmira Reformatory was established in 1876, and the reported results are that 82 per cent. of the prisoners discharged are thus far reputable and self-supporting citizens.

In view of the apparent superiority of this system, similar reformatories have been recently opened at Concord, Mass., and at Huntingdon, Pa., and others are in process of construction in Ohio, Minnesota, and Kansas, and in several other States similar action is under legislative consideration.

The Reformatory at Concord, Mass., was opened in 1884. Like Elmira, it has three grades and a marking system, by which the prisoner rises or falls, but unlike Elmira, it receives misdemeanants as well as felons, and there is no limit as to age or number of offences, and only a part of the prisoners are subject to the indeterminate sentence. Larger privileges are allowed than at Elmira, and religious influences are made more prominent. Then there are other differences of a minor character, but whether these changes are improvements or not, it is too early yet to determine, but thus far the results are encouraging to the prison authorities.

The prison for women at Sherborn, Mass., established in 1877, is also conducted on a system similar to that at Elmira, although it has four grades instead of three, and its inmates are mainly misdemeanants under definite sentences. It is wholly under the management of women, and as a prison for women it has no superior.

The Ohio Penitentiary, at Columbus, although not a reformatory in name, has adopted the grading and marking system of Elmira, and also maintains night-schools, in which the elementary branches of a common school education are taught. A system of parole has been authorized for the Ohio Penitentiary which is unlike that of any other American prison, and its reformatory influences have been so satisfactory and promising as to deserve special notice.

The law authorizing this was passed May 4, 1885, and provides, Sec. 8, "that said board of managers shall have power to establish rules and regulations under which any prisoner who is now or hereafter may be imprisoned under a sentence other than for murder in the first or second degree, who may have served the

minimum term provided by law for the crime for which he was convicted, and who has not previously been convicted of felony, and served a term in a penal institution, may be allowed to go upon parole outside of the buildings and enclosures, but to remain, while on parole, in the legal custody and under the control of the board, and subject at any time to be taken back within the enclosure of said institution; and full power to enforce such rules and regulations, and to retake and reimprison any convict so upon parole, is hereby conferred upon said board, whose written order, certified by its secretary, shall be sufficient warrant for all officers named therein, to authorize such officer to return to actual custody any conditionally released or paroled prisoner, and it is hereby made the duty of all officers to execute said order the same as ordinary criminal process."

The rules under which this law is operated are as follows:

1. No prisoner shall be paroled who has not been in the first grade, continuously, for a period of at least four months.
 2. No prisoner shall be released on parole until satisfactory evidence is furnished to the board of managers, in writing, that employment has been secured for such prisoner from some responsible person, certified to be such by the auditor of the county where such person resides.
 3. No prisoner shall be paroled until the managers are satisfied that he will conform to the rules and regulations of his parole.
 4. Every paroled prisoner shall be liable to be retaken and again confined within the enclosure of said institution for any reason that shall be satisfactory to the board of managers, and at their sole discretion, and shall remain therein until released by law.
 5. It shall require the affirmative vote of at least four (out of five) managers to grant a parole.
- The principal requirements of the paroled prisoner are: That he shall refrain from crime; lead an honorable life; conduct himself honestly; avoid evil associations; obey the law; abstain from the use of intoxicating liquors as a beverage, and report monthly by mail to the secretary of the board, for which blanks are furnished.

The following are the tabulated results of the law for the whole period of its operation prior to Jan. 1, 1888:

Number paroled,	302
Number discharged by expiration of sentence,	115
Number discharged by board of managers,	9
Number pardoned by governor,	4
Number whose paroles were revoked,	3
Number violated parole and not returned,	15
Number violated parole and have been returned,	17
Number who have died,	5
Number who refused to accept parole,	1
Number regularly reporting,	133

JUVENILE OFFENDERS.

In the care and reformation of juvenile offenders the United States has kept pace with the best experience of the world. The first reformatory in the world for criminal youth, which became a permanent success, was that established by John Falk, at Weimar, in Germany, in 1813. This was followed in 1816 by another near Düsseldorf, and still another at Berlin in 1819. None of these establishments, however, received their inmates from the courts, nor held them upon legal warrants. The relation was voluntary upon both sides.

To America belongs the credit of establishing the first reformatory in the world for juvenile delinquents, by legislative enactment and under legislative control. This institution, conceived by Edward Livingston, the greatest of American penologists, and fostered by John Griscom, John Eddy, Cadwallader D. Colden, and other distinguished citizens and philanthropists of the city of New York, was authorized by an act of the Legislature of New York March 29, 1824, and has since been known as the New York House of Refuge, and still remains in active and efficient operation.

Its fifth annual report states its powers and purposes as follows: "If a child is found destitute; if abandoned by its parents, or suffered to lead a vicious or vagrant life; or if convicted of any crime, it may be sent to the House of Refuge. There is in no case any other sentence than that it shall 'there be dealt with according to law.' That is, it may, if not released by some legal process, be there detained, if the managers should think it unfit to be sooner discharged, until it arrives at age. Parents or guardians, from the time it is legally sentenced to the refuge, lose all control of its person. When it is believed that a child is reformed, the managers have power, with its consent, to bind it as an apprentice till the age of twenty-one."

The success of this institution was so conspicuous, and its results so beneficent, that similar institutions were soon established elsewhere, until at the present time there are between forty and fifty institutions for juvenile offenders in the United States under State or city supervision, with an average population of over 12,000.

Under the common law of England a child under ten years of age is presumed incapable of crime, and that is the general rule in the United States. In New York, however, the statute provides that "a child of the age of seven years, and under the age of twelve years, is presumed incapable of crime, but the presumption may be removed by proof that he had sufficient capacity to understand the act or neglect charged against him and to know its wrongfulness."

In England the preservation of a child from a criminal record is considered so important that he is rarely sent to a reformatory for a first offence. If he has parents or guardians he is simply reprimanded or birched, for a first offence, or if homeless is cared for in some institution where no taint of crime is imposed, and this treatment in a majority of cases is found entirely sufficient. This method not only saves the child and preserves his self-respect, but it also saves the State from a large expenditure of money.

In Boston, for several years past, a system similar in principle, and applicable not only to minors but to adult misdemeanants also, has been in successful operation for a number of years, and is known as the probation system. It consists in a suspension of sentence, and a release under the supervision of a probation officer, to whom the prisoner reports at stated periods, and by whom he may be recommitted for sentence if he proves delinquent. The results have been so satisfactory that English penologists have recommended its adoption there, and an act for that purpose is now under consideration by the British Parliament.

In American reformatories, for juvenile offenders, the treatment is largely educational, although, as a rule, the inmates are employed at productive labor for the support of the institution at least one-half of the time. In recent years, however, in some institutions, large attention has been given to industrial training, and with very satisfactory results.

The State Industrial School at Rochester, N. Y. (formerly the House of Refuge for juvenile delinquents in Western New York), in 1884 inaugurated a system of industrial training, which has been so enlarged that the institution now is practically a school of technology, and its success has been so great as to attract large attention, and seems likely to mark the beginning of a new era in reformatory management. There are six departments in which trades are fully taught, both theoretically and practically, viz.: (1) carpentry and joinery; (2) wood-turning and pattern-making; (3) blacksmithing; (4) lathing, plastering, brick- and stone-laying; (5) moulding; (6) painting.

Capt. Levi S. Fulton, the accomplished superintendent of this institution, after many years' experience in reformatory work, says in his last report: "I would most earnestly recommend to all interested in the management of reform schools or similar institutions that they at once transform their institutions into

schools of technology, where they will not only educate the head but the hands also, and make of their boys skilled workmen at some trade or calling, sending them out equipped to fight life's battle honorably and successfully, and to become self-reliant, self-respecting, and self-sustaining citizens." The increased cost of the technological system, apparently, will not exceed \$30 per annum, per capita.

Reformatories for juvenile delinquents, throughout the United States, compare very favorably with the best in other countries, and in reformatory results have not been excelled anywhere. The annual conferences of those engaged in reformatory work, by affording opportunity for an exchange of experiences, have done much to improve our reformatory institutions, and a steady advance is thus maintained.

In recent years much discussion has been had upon the comparative merits of what is known as the Congregate system, and the Cottage or family system, which has not yet been settled, although the preponderance of opinion, at present, seems to be in favor of the latter. Doubtless both have their merits. The Congregate system is the simplest, and can be managed the easiest by one controlling mind, but it lacks opportunity for a classification of inmates. The Cottage system affords a larger classification, but requires a superior efficiency in the subordinate control of each cottage, which is difficult to secure. Evidently, therefore, more depends upon efficiency of administration than upon the system, and upon the ability to obtain this efficiency this question of superiority must be decided.

Clearly what is needed in all of our American institutions, whether correctional or charitable, is not so much a change of system as a higher efficiency in administration, which can only be obtained by a service based upon intelligence, experience, and integrity, together with a tenure in office which shall not be disturbed by political changes. (R. B.)

REFORMED CHURCH IN AMERICA.—
HISTORICAL SKETCH.—The colonists from the Netherlands established public worship on the island of Manhattan soon after they had made their first permanent settlement. As early as 1626 it was conducted by two "Krankbesoeckers" or visitors of the sick. In 1628 a church was organized by the Rev. Jonas Michaelius with about fifty members. He was followed by the Rev. Everardus Bogardus, who was accompanied by the first schoolmaster, Adam Roelandsen. The parochial school then established has continued to the present day. Bogardus married the widow Annetje Janse, whose farm became the valuable litigated property of Trinity Church, New York. The first church building, a small wooden structure, was erected during the ministry of Bogardus on Broad street, between Pearl and Bridge. The second was erected in 1642, during the administration of director Kieft, within the walls of Fort Amsterdam on the Battery. By the articles of surrender in 1664 the ecclesiastical rights possessed by the Dutch at the time were guaranteed to them. They continued in possession of the church in the fort, but courteously allowed the English military chaplains to use it when not occupied by them. After the completion of their new church in Garden street they abandoned the one in the fort, which continued to be used by the English garrison until 1741. At the time of the surrender New Amsterdam contained about 1500 inhabitants, and there were only five churches and six ministers in the whole province of New Netherland. Other churches were subsequently planted in the various settlements in the province. These churches were provided with pastors by the Dutch West India Company and the Classis of Amsterdam, and in a short time they came entirely under the care of that classis. They remained in this state of subordination and without a completely independent organization until the year 1794. This long period was one of struggles with many and great difficulties, and consequently of slow growth.

This body of Christians is at present small among the denominations, and surprise is often expressed that the one that was first on the ground in New York should have fallen so far behind. But little progress could be expected when there was a continuous struggle for life. 1. The surrender to the English had its effect, for it checked immigration and caused it to cease almost entirely, and many persons returned to their original homes; it also gave the advantage of official patronage to the English or Episcopal Church, which became virtually the "Church by law established," as was indeed openly claimed. 2. During this long period of nearly a century and a half the Dutch language was exclusively used in public worship, catechizing, etc., and so growth could not be more rapid than the natural increase of the Dutch population allowed. The door was closed against all English-speaking Calvinists, Scotch and Irish Presbyterians, and Congregationalists. The delay in the introduction of the English language in public worship, which was desired and urged by many, caused numbers of the young people, who were educated in English, to join the Episcopal and Presbyterian Churches; the strife produced by the agitation of the question drove many lovers of peace into other communions, and when at last the English was introduced, the uncompromising opponents of it took their leave and joined the Episcopal and Presbyterian Churches. 3. The lack of independent organization was a serious hindrance; for the final court of appeals in cases of discipline was in the mother country, and all important matters that were here agitated had to be reviewed by the Classis of Amsterdam. 4. The want of institutions for the education and of authority for the ordination of ministers was a great hindrance. Ministers were sent from Holland to supply the American churches, and young men in this country who desired the ministry were sent to the universities of Holland to be educated, and to be there ordained. Differences of opinion on this matter divided the churches into two parties, a progressive and conservative, denominated the *Coetus* and *Conferentie*, the controversy between whom on the question of ecclesiastical independence and ministerial education brought the church to the brink of ruin. In 1771 these parties were brought together in a convention held in New York, and a "Plan of Union" was adopted to which the ecclesiastical authorities in the Netherlands assented.

In 1794 the "Reformed Church in America" attained to full ecclesiastical independence by the adoption of a constitution embracing the church orders of the Synod of Dort, and articles explanatory of the ways in which they should be applied in this country. In this work of reconciliation and of organization the leader and ruling spirit was Rev. John H. Livingston, D.D., a young man who had a short time before completed his studies at the University of Utrecht, and who was one of the pastors of the Collegiate Reformed Dutch Church of New York city, and who in 1784 was appointed the first professor of theology. The efforts of the church were for a long time chiefly devoted to the establishment of educational institutions for the preparation of young men for the ministry. A charter for Queen's College was obtained in 1766, which, however, on account of some imperfections, never went into effect. A second charter was obtained in 1770 and the college was established at New Brunswick, N. J., where it continues under the name of Rutgers, given to it in 1825. It is in a flourishing condition under the presidency of Merrill E. Gates, LL.D. The theological professorship of Dr. Livingston has been developed into a theological school located at New Brunswick, N. J., with ample buildings and endowments, a corps of five professors, a valuable Biblical Museum, and the Gardner A. Sage Library, containing 40,000 admirably selected volumes, and which is acknowledged by competent judges to be one of the best working theological libraries in the United

States. This school has received for buildings, endowments, and other purposes, from the late James Suydam and Gardner A. Sage, of New York city, the sum of \$500,000. The Reformed Dutch Church was originally confined to the provinces of New York and New Jersey, with the exception of a few churches in Eastern Pennsylvania. While extension was for a long time impracticable, the scattered pastorless churches were well cared for. Some missionary work was done quite early, however, and a few churches were established in Canada which were after a time abandoned. About 1835 churches began to be established in the Western States, and soon a large colony emigrated from the Netherlands under the lead of the Rev. Dr. A. C. Van Raalte, and settled at Holland, Mich., and connected themselves with the Reformed Dutch Church in America. Immigration has continued and many churches using the Hollandish language have been established. The church has made considerable progress farther west, even as far as Dakota. At Holland, Mich., Hope College and the Western Theological Seminary have been established. The Particular Synod of Chicago embraces 104 churches and 78 ministers.

DOCTRINAL STANDARDS.—While this church strongly insists that the word of God is the sole, authoritative, and infallible rule of faith and practice, yet symbols of doctrine have been adopted as expressive of the views entertained of truth, and as bonds of church fellowship. Subscription to these symbols is required of all the ministers. They are—1. The *Belgic Confession*, composed by Guido de Bres, the Belgian martyr, consisting of 37 articles, adopted by the Synod of Antwerp in 1566, and always retained in the Reformed Churches of both the Netherlands and America. 2. The *Heidelberg Catechism*, which was prepared at Heidelberg by Olevianus and Ursinus in 1563 by the order of Frederick III., elector of the Palatinate. This catechism was at once received with great favor by the reformed of every country in Europe, and was translated into many languages. It is an experimental and confessional rather than dogmatical catechism. An abridgment of it, called "A Compendium of the Christian Religion," was made by Rev. H. Faulkelius, of Middleburg, Zeeland, and was adopted by the Synod of Dort as a manual for the instruction of candidates for the Lord's Supper. 3. The *Canons of the Synod of Dordrecht*. These were adopted in 1619, and are explanatory of the statements of the confession of faith and catechism, touching the five points in controversy between the Remonstrants and Contra-Remonstrants, or Arminians and Calvinists, and are condemnatory of the views of the former. The doctrinal system of the Reformed Church in America may be designated as Calvinism of the moderate, infra-lapsarian type of the Synod of Dordrecht.

FORM OF GOVERNMENT.—This is Presbyterian, that is, the government is in the hands of presbyters or elders who compose the ecclesiastical bodies of various grades. 1. The *Consistory* is the governing body in the local church. It is composed of the pastor (if there be one) and elders and deacons chosen or approved by the communicants. Of this body the pastor is president *ex officio*, and he has all the rights of a ruling elder. A church may appoint as many elders and deacons as it may think expedient, and it is not necessary that they should be equal in number. The elders with the pastor have sole charge of all the spiritual interests of the congregation, and are the spiritual court answering to the session in the Presbyterian Church. In the admission, dismission, and discipline of members, and in choosing delegates from their own number to the classis or next higher court, the elders only have a voice. To them belongs the oversight of the flock; they are to assist the pastor in family visitations, and they are especially charged to guard the flock against ministers who teach false doctrines or lead immoral lives. It belongs to the

deacons to care for the poor, and especially for the poor members of the flock. They are to collect and distribute the alms, and visit and comfort the needy and the suffering. While these two offices are thus distinct, yet the elders and deacons are joined together in one board and as such "have an equal voice in whatever relates to the temporalities of the church, to the calling or dismission of a minister, or the choice of their own successors." Usually this body is the incorporated board of trustees for the holding and management of all the property of the church. Elders and deacons are elected for a term of two years, and half of the places become vacant annually. A person may be re-elected immediately and repeatedly. This system of a limited term of office was adopted originally by all the Reformed churches of the Presbyterian order in Europe. It is claimed that it has great and manifest advantages, and many Presbyterian churches in America and in increasing numbers have adopted it. There are three modes of electing elders and deacons. a. The consistory chooses and gives opportunity to the members to object. b. The consistory nominates a double number and the communicants elect. c. The communicants both nominate and elect. Elders and deacons who are out of active service form an advising body called the Great Consistory, who may be consulted when a minister is to be called, or when other matters of peculiar importance occur relating to the peace and welfare of the whole congregation.

2. The *Classis* is the next higher body and corresponds to the Presbytery of the Presbyterian Church. It is composed of the pastors of the churches in a certain district, an elder delegated by each church, and such ministers without charge as have been received by the classis. The classis examines candidates for the ministry, approves calls, ordains, dismisses, and deposes ministers, forms new congregations, and is a court of appeal from sentences of the consistory. The classis meets twice a year, and sends a report on the state of religion to the Particular Synod. It has a system of oversight of the churches, and annually makes inquiry whether ministers and churches observe certain constitutional requirements.

3. The *Particular Synod* is composed of a certain number of ministers and elders delegated by the classes. It has power to form new classes and to transfer a congregation from one classis to another. It is a court of appeal from decisions of the classes. It meets annually and reports to the General Synod.

4. The *General Synod* is the highest judicatory and represents the whole church, meets annually, and is composed of an equal number of ministers and elders delegated to it. It is the final court of appeal from decisions of the lower assemblies; it has supreme control of the theological schools; it maintains correspondence with the highest judicatories of other denominations, and it exercises a general superintendence over the spiritual interests and concerns of the whole church. The powers of all these bodies are fully and carefully defined by the constitution of the church.

CULTUS.—All the branches of the Reformed Church in Europe possessed liturgies and used them. The Reformed Church of the Netherlands has her liturgy and used it, allowing, at the same time, considerable liberty to the officiating minister. The church in America, of course, possessed and used their liturgy, which has in the course of time been somewhat modified, particularly by the introduction of some new optional forms. The forms of prayer for ordinary public worship are not used by the ministers except as models for their guidance in composing their own prayers, which work every one is expected to do to the best of his ability. The constitution, besides establishing an order of worship, requires some forms to be used, and their use, therefore, is universal, viz.: 1. For the baptism of infants. 2. For the baptism of adults. 3. For the administration of the Lord's Supper. 4. For

the ordination of ministers. 5. For the ordination of elders and deacons. 6. For the excommunication of an offender. 7. For readmission of the penitent. The liturgy is the growth of time, and has been drawn from various sources. Calvin's liturgy was its basis. A liturgy based on this was used by the Church of the Foreigners worshipping in London under the superintendence of A. Iasco in the Church of Austin Friars in the time of Edward VI. In 1566 various forms for the use of the churches of the Netherlands were collected and published by Rev. Petrus Dathenus. The liturgy was modified as occasion demanded until fixed by the Synod of Dort and brought to this country by the colonists. Of late years there has been an increasing tendency to introduce more of the formal liturgical element into public worship. In addition to the reading of the ten commandments in many churches the psalter is read responsively, and the Lord's prayer and apostolic creed are repeated. There is no desire for what is called ritualism, but a disposition to give to the people a more active, expressed participation in the worship of the congregation.

MISSIONARY AND OTHER AGENCIES.—1. *Board of Domestic Missions.*—Considerable missionary work was done in the home field from the beginning. But it was without a general organization or definite system, was confined to pastorless churches using the Dutch language, and was performed by pastors making missionary tours among these churches. In 1831 the Board of Domestic Missions was formed, and a great impulse was given to the work, resulting in the establishment of churches in Western New York and in the Western States, and in new and growing communities in the East. In the year 1887-8 the board received \$28,737.52 from the churches, Sunday-schools, and Woman's Executive Committee, and 90 pastors and 108 churches were aided.

2. *The Church Building Fund.*—From this fund moneys are loaned to feeble churches to aid them in erecting houses of worship. During the year 1887-8 the moneys received for this fund amounted to \$17,061.25, including \$6,936.46 received from the Woman's Executive Committee.

3. *The Board of Foreign Missions.*—The first ministers labored considerably for the conversion of the Indians and with some success. From the early part of the present century the Reformed churches co-operated with other denominations in sending the gospel to the heathen in foreign lands. For a number of years the church was associated in this work with the American Board of Commissioners for Foreign Missions. Since the year 1857 it has carried on the work independently, and has sustained three flourishing missions, one at Amoy, in China, a second in the Madras Presidency, India, and a third in the empire of Japan. The entire number of ordained missionaries connected with all the stations is 25; of unmarried, 3; of married women, 21; of unmarried, 9; making a total of 58. Besides these there are many native helpers. The missionaries have done their full share in translating the Scriptures and providing a Christian literature for the people. The total expenditure of the board for the year 1887-8 amounted to \$98,495.61; of this sum \$19,329.04 were received through the Woman's Board of Foreign Missions.

4. *Board of Education.*—Indigent young men are assisted in their preparation for the ministry by contributions from the churches and income from invested funds, chiefly in the form of scholarships. Also moneys are, to some extent, appropriated for the support of educational institutions. During the year 1887-8 eighty students received assistance, and the payments of the board for all purposes amounted to \$22,013.99.

5. *Board of Publication.*—It is the aim through this agency to supply the church with good Christian literature, and especially literature of denomina-

tional interest and value. It has its benevolent as well as business department. It has made donations during the last year amounting to \$1380.85.

6. *Widows' Fund and Disabled Ministers' Fund.*—These provide for families of deceased ministers and for disabled ministers. An interest in the former is secured by certain annual payments, but the latter is a pure charity. The capital sum of the former is \$73,970.99; of the latter \$53,817.28. The available income of both these funds is largely increased by contributions from the churches.

To these agencies we add that of the press. A monthly magazine called the *Mission Field* is published, and the *Christian Intelligencer* is the second oldest religious weekly in New York. It may be regarded as the organ of the denomination, being specially devoted to its interests. The minutes of the General Synod of June, 1888, furnish the following statistics: Churches, 546; ministers, 555; families, 47,520; communicants, 87,015; Sunday-schools, 750; scholars, 96,019; contributions for religious and benevolent purposes, \$284,902; for congregational purposes, \$970,856. The churches were at first known as Low Dutch Reformed churches or simply as Dutch churches. The title of the denomination afterwards was the Reformed Protestant Dutch Church. In 1867 it was changed to the "Reformed Church in America."

For further information the reader is referred to Ypey and Dermout's *Geschiedenis de Hervorm de Kerk, Hansen's Reformed Church in the Netherlands*, Corwin's *Manual of the Reformed Church in America* (3d edition), *Centennial Discourses* (1876), *Centennial of the Theological Seminary at New Brunswick* (1884), Gunn's *Life of Livingston*, Demarest's *History and Characteristics of the Reformed Dutch Church*, and *Acts and Proceedings of the General Synod*.

(D. D. D.)

REFORMED CHURCH IN THE UNITED STATES. This religious body, formerly known as the German Reformed Church, is directly derived from the Reformed churches of Germany and Switzerland. It may, therefore, claim to be, in a special sense, the American representative of the German branch of the great religious movement of which, in the sixteenth century, Zwingli, Calvin, and Ursinus were the most eminent leaders. Its standard of doctrine is the Heidelberg Catechism, and in government it holds to the Presbyterian system.

The history of the German Reformed Church in America properly begins with the dreadful period in German history which is known as the War of the Palatinate (1689-1697). The region of the Rhine had been utterly devastated, and cities like Heidelberg, Spire, and Worms were in ruins. Driven from their desolated homes by successive French invasions, many thousands of the peasants of the Palatinate sought a home in foreign lands. Large numbers were conveyed to America, through the charity of Queen Anne of England, and small German settlements were founded in Pennsylvania before the end of the seventeenth century. Poverty and oppression continued in the fatherland after peace had been nominally declared, and emigration increased with each succeeding year. The extremely cold winter of 1709, which, it is said, for a time rendered Switzerland almost uninhabitable, started another wave of emigration, which was largely composed of Swiss elements. About the middle of the last century it was estimated that one-half of the German population of Pennsylvania belonged to the Reformed Church. Among them were many descendants of the Huguenots who fled from France at the revocation of the Edict of Nantes. Beginning with 1709 we divide the history of the Reformed Church in the United States into five periods:

I. 1709-1746.—During this period the records of the church are very incomplete. The people were very poor, and religious meetings were often held in private houses. Congregations were frequently served

by unordained ministers. In 1709 John Frederick Hager was commissioned by the Society for the Propagation of the Gospel to labor "among the Palatines, New York." Contemporary with him were John Jacob Oehl, in New York, and Henry Hoeger, in Virginia. Samuel Guldin preached in Pennsylvania before 1718, as appears from a volume published by him in that year. John Philip Boehm, who had been a schoolmaster in the Palatinate, began to preach, without ecclesiastical authority, to the congregations at Falconer Swamp, Skippack, and When Marsh, Montgomery co., Pa., as early as 1720. He was regularly ordained in 1729 by the Dutch ministers in New York, by special permission of the Classis of Amsterdam. John Henry Goetschius, a native of Zurich, was in 1730 pastor of eleven congregations, of which New Goshenhoppen was the most prominent. In 1727 the Rev. George Michael Weiss, at the request of the Classis of the Palatinate, accompanied a company of 400 Palatine emigrants to America, "in order that they might not be without religious instruction." In 1730 he revisited Europe, in company with Elder Jacob Reiff, for the purpose of collecting money and good books for the Reformed churches of Philadelphia and Skippack. This mission led to important results. A considerable sum of money was collected, and the synods of Holland became so profoundly interested in the American churches that they agreed to take them under their special care and supervision, and to supply them with ministers.

In 1730 John Peter Miller and J. B. Rieger came to America, under the auspices of the Consistory of Heidelberg. Miller afterwards left the Reformed Church, and became the prior of the convent of Seventh-day Baptists which had been founded at Ephrata, Pa., by Conrad Beissel. In 1742 Henry Antes and others joined with Count Zinzendorf in the organization of the "Congregation of God in the Spirit." They proposed that the various churches should be united in a higher unity, without sacrificing their denominational peculiarities. Though the fact was rather implied than expressed, the Moravians were to be the controlling power in the whole movement. The "Congregation" ordained a number of ministers for service in the Reformed churches. These declared themselves opposed to the proposed union with Holland, and professed their adhesion to the decrees of the Synod of Berne. On the failure of this union movement, about 1746, most of these ministers joined the Moravians.

II. 1746-1793.—The arrival in America of Michael Schlatter, on the 1st of August, 1746, was an important event in the history of the Reformed Church. He had been sent by the synods of Holland with directions to visit the scattered churches, to establish pastoral charges, and if possible to organize a *Cœtus*, or ministerial conference. In this work he was eminently successful. The *Cœtus* met for the first time in Philadelphia in 1746, and was fully organized in 1747. It differed from a synod only in the fact that its decisions were not final until they had been approved by the synods of Holland. At the request of the *Cœtus*, Schlatter, in 1751, went to Europe for the purpose of presenting the cause of the destitute German churches in America. His mission was very successful, especially in Holland. A sum of money, amounting to £12,000, was collected and invested for the benefit of the American churches. In 1752 he returned to America, bringing with him six young ministers.

The success of Schlatter's mission suggested an extensive educational movement in behalf of the Germans of Pennsylvania. A large fund was brought together in England, and a number of schools were founded which were known as "charity schools." Schlatter was induced to become Superintendent of Schools, but unfortunately this educational movement was made to assume a political character, and proved a failure. Schlatter became disheartened, and with-

drew from active participation in ecclesiastical affairs. After his retirement the most prominent men in the *Cœtus* were J. Conrad Steiner, author of several volumes of sermons, and William Stoy, who was also an eminent physician. Dr. J. Daniel Gross was professor in Columbia College, New York, and author of a work on *Moral Philosophy*. Philip William Otterbein was a warm friend of the early Methodists, and though himself remaining in the Reformed Church, organized religious societies, from which sprang the denomination known as the "United Brethren in Christ." Rev. Drs. Caspar Weyberg and William Hendel were successively pastors in Philadelphia, and in connection with Drs. J. H. C. Helmuth and H. E. Muhlenberg, of the Lutheran Church, were especially prominent in the organization of Franklin College, an institution founded in 1787 at Lancaster, Pa., to promote higher education among the Germans. This college was named in honor of Benjamin Franklin, who was at that time governor of Pennsylvania, and who contributed liberally to its endowment. Unfortunately its resources were not equal to its necessities, and for many years it failed to meet the expectations of its founders.

In 1770 the Dutch churches of New York invited the German churches of Pennsylvania to unite with them in the establishment of a single General Synod, but the Germans declined, on the ground that they were unwilling to be separated from the synods of Holland. During all these years the minutes of the *Cœtus* were sent to Europe for revision and approval. If the synods of Holland had granted to the *Cœtus* the privilege of conferring the rite of ordination this intimate relation might have been indefinitely continued, but on this point the Hollanders were inflexible. The assertion of the right to ordain ministers led to the final separation, which was, however, accomplished without extended controversy. The *Cœtus* declined, in courteous terms, to submit its future proceedings to the revision of "the fathers," and thus by its own act became an independent synod.

III. 1793-1820.—The Synod of the German Reformed Church met for the first time at Lancaster, Pa., in 1793. The number of ministers at this time was about twenty. The condition of the church was not encouraging. Its earliest pastors, who had been trained in Europe, had passed away, and many of their successors had been imperfectly educated. In consequence of the delay in establishing literary institutions there was a great scarcity of ministers, and many churches were lost to the denomination. The introduction of the English language into the services of the church led to serious conflicts. The earliest Sunday-school was organized in the church on Race street, near Fourth, Philadelphia, April 14, 1806. A few books were written, by Drs. C. L. Becker, Samuel Helfenstein, and others, but there was little literary activity. The pastors, however, generally attended faithfully to the duties of their office, as they understood them, and were especially careful to catechize the young as a preparation for their admission to full membership in the church. The most hopeful indication was a general longing for better things, which, although expressed in abortive synodical resolutions, was a prophecy of future advancement.

IV. 1820-1863.—At the beginning of this period the number of ministers was about seventy. The difficulty of bringing them together to synodical meetings probably first suggested the desirability of establishing subordinate ecclesiastical bodies. The Classis, or Presbytery, has always been regarded as of fundamental importance to the reformed system of government, and its introduction into the German Reformed Church of this country appropriately marks the time of its awakening to the nature of its mission.

In 1820 the classes, eight in number, met for the first time. In the same year the synod, convened in Hagerstown, Md., adopted a plan for the establish-

ment of a theological seminary, and Dr. Philip Milledoler, of New York, was elected professor of theology. Dr. Milledoler declined the call, and it was not until 1825 that the seminary was formally opened at Carlisle, Pa. The first professor of theology was Dr. Lewis Mayer. In the summer of 1825 Rev. James R. Reily visited Europe, and collected a considerable sum for the new institution. One of the most liberal contributors was Frederick William III., king of Prussia. In 1829 the seminary was removed to York, and in 1837 to Mercersburg, Pa.

Marshall College was founded at Mercersburg in 1835. The first president was Rev. Frederick A. Rauch, Ph. D. (1806-1841), who is best known as the author of a work on *Psychology*, which may be said to have introduced this science to the attention of American students. John Williamson Nevin, D. D., LL. D. (1803-1886), was professor of theology at Mercersburg, 1840-51, and president of Marshall College, 1841-53. He was a man of great learning and ability, and to the end of his life his influence was extraordinary. (See NEVIN.) In 1843 a commission was sent to Germany to invite a German professor to accept a professorship at Mercersburg. Their choice fell upon the Rev. Dr. Philip Schaff, at that time professor extraordinary at Berlin. He accepted the call, and was installed professor of church history and biblical literature in 1844. The succeeding years were marked by intense theological and literary activity. The two professors, Drs. Nevin and Schaff, labored in perfect harmony, and their influence extended far beyond the limits of the Reformed Church. In 1846 Dr. Nevin published his *Mystical Presence*, a book which has been regarded as marking an epoch in the history of American theology. Soon afterwards he published *The History and Genius of the Heidelberg Catechism*, and a tract, entitled *Antichrist, or the Spirit of Sect and Schism*. After 1849 he edited the *Mercersburg Review*. During the same period Dr. Schaff wrote his *History of the Apostolic Church* and several other books. He also edited the *Kirchenfreund*, a monthly magazine, devoted to the interests of the German churches. (See SCHAFF.)

German theology and philosophy were in those days little known in this country, and their introduction at Mercersburg induced controversy and opposition. Gradually the utterances of the professors came to be known as "Mercersburg theology"—a term at first employed by its opponents, but afterwards tacitly accepted by its friends. It did not properly designate an organized theological system but a movement in the life of the church; and consequently left room for injudicious and extreme utterances on the part of professed friends which did it more harm than the attacks of its most violent opponents.

In 1853 Marshall College was removed to Lancaster and united with Franklin College, the Reformed Church having first purchased the Lutheran interest in the latter institution. The theological seminary remained at Mercersburg until 1871, when it was also removed to Lancaster. Since the retirement of Drs. Nevin and Schaff, theological professorships at Mercersburg and Lancaster have, at various times, been occupied by the Rev. Drs. Bernard C. Wolff, Henry Harbaugh, E. V. Gerhart, Thos. G. Apple, and Frederick A. Gast.

The history of the Reformed Church in the West begins with the first decade of the present century. Rev. Jacob Christman began to preach in Ohio in 1803. In the same year Rev. Samuel Weyberg is said to have preached the first Protestant sermon west of the Mississippi River, at Cape Girardeau, Missouri. In 1804 Rev. John Jacob Larose began his labors in Ohio. The Synod of Ohio was organized in 1824 by eight ministers, and was for many years independent of the Synod of the United States. The Western Theological Seminary and Heidelberg College were founded at Tiffin, Ohio, in 1850. Theological professorships have been held by the Rev. Drs. E. V. Ger-

hart, Moses Kieffer, J. H. Good, Herman Rust, and D. Van Horne.

About the year 1853 the work of missions among the Germans in the West was greatly enlarged. In this movement the Rev. Drs. Max Stern, H. A. Muehlmeier and H. J. Ruetenik were especially prominent. Among its results may be mentioned the formation of three German synods, with forty thousand members and all the institutions necessary to effective church-work.

V. 1863-1889.—In 1863 the General Synod met for the first time, having been founded by the concurrent action of the two existing synods. The same year is memorable for the Tercentenary Celebration of the Heidelberg Catechism, which greatly stimulated the devotion and benevolence of the church. From 1866 to 1878 there was a serious controversy concerning liturgical worship, but in the latter year all the questions at issue were committed to a special commission which was successful in restoring peace to the churches. The word "German" was erased from the church-title in 1869. The question of organic union with the Reformed Church in America has recently claimed renewed attention. The chief obstacle in the way of union is a difference in doctrinal standards. Though both churches are equally attached to the Heidelberg Catechism, the Reformed Church in America holds, in addition, the Belgic Confession and the articles of the Synod of Dordrecht. The German body has hitherto declined to subscribe formally to the latter confessions, regarding them as the exclusive possession of the Church of Holland.

The Reformed Church in the United States, as at present constituted, is governed by a General Synod, which meets triennially. There are eight district synods, of which five are English and three German. The number of classes is 54. There were, in 1887, 817 ministers, 1481 congregations, and 183,980 communicant members. The principal literary institutions connected with the church are Franklin and Marshall College, Lancaster, Pa.; Heidelberg College, Tiffin, Ohio; Ursinus College, Collegeville, Pa.; Catawba College, Newton, N. C.; Calvin College, Cleveland, Ohio, and the German Mission House at Franklin, Wis. Four orphan homes are under the care of the church, and twenty-three periodicals are published in its interest. The missionary activity of the Reformed Church has been mostly directed to the spiritual care of the German and Swiss immigrants who have formed settlements in the West, but the means at hand have proved utterly inadequate to this enormous work. A foreign mission, founded in Japan in 1878, has proved successful. The Germans have also established a mission among the Winnebago Indians.

The Reformed Church has few distinctive peculiarities. It aims to hold the truth in due and harmonious proportion. Its Catechism, according to its own statement, rests upon the Apostles' creed. It teaches substantially the Augustinian doctrine of natural depravity and salvation by free grace alone; but allows freedom for more moderate views on the subject of predestination than are usual in the more strictly Calvinistic Reformed churches. With regard to the sacrament of the Lord's supper it teaches the spiritual real presence of the flesh and blood of Christ in the Holy Eucharist, for believers only. It regards the children of Christian parents as proper subjects for baptism. The church insists that ministers shall carefully instruct the young in the teachings of the Catechism, as the best means of preparing them for the public profession of their faith. Confirmation is practised, not as a sacrament but as a solemn and appropriate rite. In worship the church is moderately liturgical, valuing and using a liturgy without abridging the liberty which is the privilege of pastors and people. In brief, the church, like its honored symbol, allows all proper liberty in the development of the truth; and withal is full of charity towards other branches of the Church of Christ.

Authorities.—History of the Reformed Church, vol. 1, by Lewis Mayer, D. D.; Harbaugh's Life of Schlatter; Fathers of the Reformed Church (5 vols.), by Harbaugh and Heisler; Historic Manual of the Reformed Church in the United States, by Joseph Henry Dubbs, D. D. (J. H. D.)

REFORMED EPISCOPAL CHURCH. This church was organized in the city of New York, Dec. 2, 1873. The history of this movement dates back to the English Reformation. The antagonism of Henry VIII. was with the papal supremacy. With the Reformation he had no sympathy. Toward it his opposition was open and intense. The real work of church reform in England dated from the reign of Edward VI. Then for the first time the errors of the Church of Rome were assailed, and the recasting of the doctrine, discipline, and worship of the English church into a Protestant mould began. The work was, however, arrested before completion by the early death of Edward. His Prayer Book, set aside by his successor, was restored by Elizabeth. Changes were made, but not in the line of Cranmer's revision. Their avowed object was the conciliation of the Romish party. From that time on there have been changes and additions in the English Prayer Book in this same direction. The result has been a divided church—two parties, the one sympathizing with Romish views and the other maintaining evangelical doctrines. The daughter church in the United States, the Protestant Episcopal, inherited the liturgy and traditions of the mother church, and also its diversities of thought. After the Revolution, the Episcopal Church in this country needed to be reorganized, and Bishop White sought to place it on an evangelical basis. To this end he revised the Prayer Book; other influences, however, gained ascendancy, and his "Proposed Book" was rejected. Consequently the same conflicts have continued to disturb the daughter that had so long agitated the mother church. In 1835 a new infusion of life began in high church circles. The so-called *Tracts for the Times*, emanating from Oxford, were immensely popular. The writings of the Fathers and mediæval literature were brought into prominence. The sacramentarian and sacerdotal theories, and the divine right of Episcopacy, became the standard of a new movement. The daughter church in America felt the impulse. The high church element fell into line, and, cautiously at first, began to teach and preach the advanced doctrines. The evangelical element took the alarm and rallied at once. It was by far the dominant party. Its leaders were among the foremost men in the church. No less than three organizations were put in operation to resist the inroads of these new tendencies. But steadily the innovations made headway. Those who advocated them claimed that the Prayer Book was with them. The Evangelicals had initiated the fight, confident in right and in numerical strength. It was not long, however, before they were on the defensive. Their numbers decreased, while their opponents grew stronger and more aggressive. At last the Evangelicals found themselves reduced to that extremity that they could no longer fight, and were necessitated to become petitioners. They asked for such changes in the Book of Common Prayer as would enable them with a good conscience to remain in the church. Their appeals were unnoticed. On all occasions they were made to understand that if they could not conform to high church legislation and Prayer-Book interpretation, they had better leave.

It was about this time that the Right Reverend George David Cummins, D. D., Assistant Bishop of Kentucky, began to show an interest in the ecclesiastical questions of the day. He had been consecrated bishop in 1866. Up to this event and for several years after he was seemingly indifferent to the struggle that was going on. His views had ever been evangelical, but his conservative tastes had been drawing

him seemingly closer to the high church men. It was in the discharge of the duties of his new office that his eyes were opened. There were practices in vogue in his diocese that he could not approve. As assistant bishop he was powerless to command or even rebuke. Remonstrance was all that was left him, and this was met by appeals to the Prayer Book, which, it was asserted, authorized what he condemned. This claim drove him to a study of the questions that were agitating the church, and he was not long in making up his mind and taking his stand. He then became bold and aggressive. In one respect he stood alone among the evangelical bishops and leaders of the party. Experience had taught him that the root of the trouble was in the Prayer Book. Its language in some instances taught, and in others shielded, the priestly and sacramentarian theories, and as long as it remained as it was he saw clearly that the Romanizers would have the right of way in the church. He therefore called for a revision of the Prayer Book, and a perfecting of the work that Cranmer had so well begun, and that Bishop White had in vain attempted to carry out.

In October, 1873, the Evangelical Alliance assembled in the city of New York. Bishop Cummins was an interested and active worker. On October 12 the members of the Alliance united in a communion service. Bishop Cummins was present, making an address and delivering the cup. From within his church, rebuke, censure, threats of ecclesiastical discipline, were unsparingly showered upon him. Not only had he united with non-episcopally ordained ministers in celebrating the Lord's Supper, but as a bishop in the church he had compromised his office by taking a subordinate place. So intense was the hostility aroused by this unchurchly act on his part, and so bitter was the manifestation both in public attacks and in private communications, that he felt that his usefulness in his church, and especially in his diocese, was at an end. Prior to this the painful conclusion had forced itself upon him that Prayer Book revision was hopeless within the church; and without such revision he felt assured that the evangelical element must die out. Constrained by these considerations he determined to withdraw from the church. His resignation, addressed to the presiding bishop, is dated October 30. On consultation with friends an organization was determined upon, and a call issued. The object was thus stated: "To organize an Episcopal Church on the basis of the Prayer Book of 1785 (the Bishop White Prayer Book), a basis broad enough to embrace all who hold the faith once delivered to the saints, as that faith is maintained by the Reformed churches of Christendom; with no exclusive and unchurching dogmas toward Christian brethren who differ from them in their views of polity and church order."

Eight clergymen and nineteen laymen responded to this call, and the Reformed Episcopal Church was organized. It claims to be the church of the Reformation—the church that Edward VI. and Archbishop Cranmer and Bishop White would have had, if the times had permitted, and to the Anglican and American Episcopal Church it stands in the same relation as these churches do to the churches of Rome and of the East—a *Reformed Church*.

Doctrine.—This church plants itself upon "the Holy Scriptures of the Old and New Testaments as the Word of God, and the sole rule of faith and practice." It "declares its belief . . . in the creed, commonly called the Apostles' Creed; in the divine institution of the sacraments of baptism and the Lord's supper; and in the doctrines of grace substantially as they are set forth in the Thirty-nine Articles of religion." It is emphatic in its protest against those errors that necessitated its organization.

Worship.—It is liturgical, but not exclusively so. It retains the use of "a liturgy which shall not be un-

perative or repressive of freedom in prayer." In its constitution it provides that the "Book of Common Prayer . . . shall be used in this church, at such times and with such liberty as the canon on this subject shall provide; but no canon shall make its use imperative on all occasions, nor forbid the use of extempore or other prayer at suitable times." Rejecting the Prayer Book of the Protestant Episcopal Church, that of 1785, known as the Bishop White Prayer Book, was adopted, and has been so amended as to suit present needs.

Ministry.—In its ministry it "adheres to Episcopacy, not as of divine right, but as a very ancient and desirable form of church polity." It holds to two orders—presbyters and deacons. The bishopric is an office, and the bishop is "*primus inter pares*."

Government.—Its government rests in, 1. A *General Council* that at present includes all its bishops and presbyters, with lay representatives who shall be communicants and members of the congregation they respectively represent. This body represents and legislates for the churches in the United States and Canada. Its meetings are now biennial. 2. *Synodical Councils*. The whole body is divided into synods. Each synod is under the jurisdiction of a bishop with his standing committee. It has its annual council, and legislates on matters that are purely local. 3. *Parish* organization, which consists primarily of the congregation. From them, by election, come vestrymen, wardens, parish council, members of the general and synodical councils, and, through the vestry, the pastor.

Church Union.—Bishop Cummins, in his address at the organization of the church, said: "We regard our movement only as a step towards the closer union of all evangelical Christendom. For this we shall labor and pray. We gladly acknowledge the validity of the ministerial orders of our brethren whom God has sent into his vineyard, and whose labors he has accepted and blessed. We shall invite all ministers of evangelical churches to occupy our pulpits, and to take part in our services, and we shall rejoice to meet them and their flocks as often as may be expedient around the Lord's table, and acknowledge that we, being many, are one body in Christ, and members one of another."

The aim of the church has been in this direction. It has broken down the barrier of Episcopacy "as of divine right," and has placed it on the historic basis, "as a very ancient and desirable form of church polity." In adopting the XXXIX Articles of the Church of England, it has so amended the XXIVth that it reads: "The doctrine of 'apostolic succession,' by which it is taught that the ministry of the Christian Church must be derived through a series of uninterrupted ordinations whether by tactual succession or otherwise, and that without the same there can be no valid ministry, no Christian church, and no due ministration of baptism and the Lord's supper, is wholly rejected, as unscriptural and productive of great mischief. This church values its historic ministry, but recognizes and honors as equally valid the ministry of other churches, even as God the Holy Ghost has accompanied their work with demonstration and power." In its canons it provides that—"Any presbyter of another church may be received by a bishop and standing committee as a presbyter of this church, without reordination." It reciprocates "fraternal greetings" with other evangelical churches. It invites to friendly interchange of pulpits. It receives communicants by letter from other churches, and on every communion occasion it invites "fellow-Christians of other branches of Christ's church" to the Lord's table.

Statistics.—The following report was made to the General Council, May, 1887: Bishops, 7; ministers, 92; communicants, 8467; Sunday-school scholars, 11,811; teachers, 699; contributions, \$156,064. Property

unincumbered, \$1,083,361. These statistics include the churches in the United States and Canada. There is a branch of this church in England, but without organic connection with the General Council. Its theological school has graduated its first class of two students. Its faculty consists of a dean and three professors. It begins its second year with eight students. The *Episcopal Recorder*, published in Philadelphia, is the organ of the church. (B. B. L.)

REFORMED PRESBYTERIAN CHURCH IN NORTH AMERICA. This is the formal title of the body which is commonly termed the *Covenanter Church*. The former name by its first part carries us back to the second reformation of British history, in the seventeenth century. By its second part it indicates the form of government, Presbyterian. The familiar name, *Covenanter*, belongs to the history of the Church of Scotland in the seventeenth century. The restoration of Charles the Second in 1660 marked the beginning of sore persecution, the "killing times" for those who held to the Covenants of Scotland, and became known as *Covenanters* (see *COVENANTERS*, in the *ENCYCLOPEDIA BRITANNICA*). It is from this people the *Covenanter Church* in America originated, and correspondence is maintained by it with the Synod of the Reformed Presbyterian Church in Scotland.

I. Early History.—The persecuting times in Scotland were marked not only by the martyrdom of many of the Covenanters, but also by the voluntary and enforced exile of many more. They were banished to North America and Jamaica, many sought an asylum in the New World, many found refuge in Ulster, whence their children came to these shores. In 1684 thirty were banished to Carolina; four, the same year, to New Jersey; one hundred, twenty-four of them women, were transported to New Jersey. The first emigrants came mostly to Delaware, Eastern Pennsylvania, New York, and South Carolina. In the early part of the eighteenth century they were found in the Cumberland Valley, forming "societies" as in Scotland—that is, worshipping assemblies without a pastor, along the tributaries of the Susquehanna. The principal settlements were at Octorara and Paxtang, and on the Conococheague in Pennsylvania. These kept up correspondence, and in 1743 organized a "General Meeting" to legislate for the *Covenanter* communities. The same year they covenanted at Octorara, renewing the Scottish Covenants, and vowing to "keep their bodies, property, and conscience against all attacks; to defend Christ's gospel and the purity of the church; to submit to no ruler who would not submit to Christ, and to defend their liberty from fears without and within." The first preaching they received was from Rev. Alexander Craighead (1707-66) in 1743. He was ordained a Presbyterian, but acceded to the Covenanters, and remained with them seven years, and soon after leaving them migrated to North Carolina. The first *Covenanter* settlement in the State of New York was on the Wallkill, in Orange co., N. Y. In the year 1748 Mr. James Rainey removed from Philadelphia and settled here, and in 1753 a society was formed. The banishment of Covenanters to Carolina has already been noted. Chester District, in South Carolina, early became their centre, and after Mr. Craighead had gone South some removed from Pennsylvania, settling along Rocky Creek, and were soon strengthened by emigration from Ireland. By the middle of the eighteenth century there were societies of Covenanters from Connecticut to South Carolina. The Pennsylvania societies earnestly desired help from the mother church in Scotland, when left by Mr. Craighead in 1749. The first minister to come was Rev. John Cuthbertson (1718-91), who landed at Newcastle, Del., Aug. 5, 1751. He served the scattered societies for 22 years, making his home in Octorara. His diary is extant, and we have a full account of his extended journeys taken on horseback, in visit-

ing the Covenanters in New York, Vermont, New Hampshire, Connecticut, New Jersey, Maryland, Virginia, and Pennsylvania, as far as the Ohio River. He chronicles the names of the families he visited. In 1759 Rev. Alexander McDowell left the Presbyterian Church and joined the Covenanters, being in sympathy with them in their adherence to the Solemn League and Covenant and the usages of the Church of Scotland. He ministered mainly to the New England societies, but was also in Eastern Pennsylvania, whence returning to New England in 1761 his further history is not known. In 1766 the Reformed Presbytery of Ireland sent out Rev. Daniel McClelland. He had been in America, but went back and pursued his theological studies, being ordained in 1765. He preached for a time among the societies in Connecticut and Eastern Pennsylvania, going in the spring of 1768 to New England and was lost sight of. In 1772 Rev. William Martin (1729-1806) came from Ireland with a colony, which settled in South Carolina on Rocky Creek. He graduated at Glasgow in 1753, and was ordained at Vow on the lower Bann, the first Covenanter minister ordained in Ireland. In the spring of 1773 the Paxtang society sent a commissioner to Ireland to secure ministerial help for Mr. Cuthbertson. Rev. Alexander Dobbin and Rev. Matthew Linn answered the call and were met at Philadelphia Dec. 13, 1773, by Mr. Cuthbertson. These three ministers constituted the first Reformed Presbytery in America, March 10, 1774. Each had his field of labor in Eastern Pennsylvania, Mr. Martin, the fourth Covenanter minister then in America, laboring in South Carolina.

This brings us to the eve of the Revolution. The trials of the fathers in Scotland had led them to narrowly examine the principles of civil government, and *Lex Rex* by Samuel Rutherford, the *Hind Let Loose* by Alexander Shields, and *Jus Populi Vindicatum* show their conclusions. Their children were filled with democratic ideas and were not only in sympathy with the rising spirit of the colonies but were in the van. The covenanting of 1743 at Octorara had challenged the attention of the provincial governor. Mr. Craighead spread their principles in Carolina, and the members of the convention at Charlotte that formed the first declaration of independence, May, 1775, known as the Mecklenburg Declaration, were members of the churches he had founded. Thomas Jefferson had before him the account of the proceedings at Octorara when he penned the Declaration of 1776, and the Mecklenburg Declaration is also reflected in it. July 2, 1777, Rev. John Cuthbertson and many of his people, after sermon, swore fidelity to the cause of the colonies. Rev. William Martin was imprisoned and brought before Lord Cornwallis in 1780 at Winnsboro, South Carolina, for his patriotism.

The Covenanters went heartily into the war to throw off the yoke of Great Britain. War is leavening. The changed condition of affairs led to discussion and then to assimilation with the body nearest them, the Associate, made up of members of the body which rose in Scotland by secession from the Established Church in 1732. The union was formed at Philadelphia, Nov. 1, 1782, and the united church was known as the Associate Reformed (*q. v.*). The larger part of the Covenanters of the North followed their ministers into the union. The Southern Covenanters were not involved in this step. The remnant in the North, being without a minister, fell back again to their condition in 1749.

In 1789 the Reformed Presbytery of Scotland sent out Rev. James Reid on a missionary tour, in answer to repeated requests from America. He journeyed from New York to South Carolina, reorganizing and encouraging the people, spending less than a year. His report produced fruit, and Rev. James McGarragh (1752-1816) was sent by the Reformed Presbytery of Ireland, reaching South Caro-

lina in the spring of 1791. Rev. William King (1747-98) was sent by the Reformed Presbytery of Scotland and reached South Carolina in the fall of 1792. They were associated as a committee of the Scotch Presbytery. They restored Rev. William Martin, who had been disciplined for intemperance. In 1793 Rev. James McKinney (1759-1802) came from Ireland, having fallen under the ban of the British government at home, on account of his sympathy with the Irish cause. On his arrival he favored the formation of a Presbytery, but acted with the Scotch committee. He travelled from Vermont to the Carolinas, ministering to the societies and organizing many congregations. In the fall of 1797 Rev. William Gibson (1753-1838) came from Ireland, also John Black and Samuel B. Wylie, students of theology.

Rev. James McKinney and Rev. William Gibson, with ruling elders, May 18, 1798, at Philadelphia, reconstituted the Reformed Presbytery, that had been dissolved by the union of 1782. June 24, 1799, Alexander McLeod (1774-1833) was licensed by this Presbytery at Coldenham, N. Y. He was pastor in New York city, 1801-33. He was chairman of the committee to prepare the testimony, and in May, 1806, the "Declaration and Testimony of the Reformed Presbyterian Church in America" was unanimously adopted by the Presbytery. In 1807 the "Terms of Communion" were prepared. The increase of the ministry and people now called for the formation of a higher court and, May 24, 1809, the Synod of the Reformed Presbyterian Church was organized at Philadelphia. The next year a theological seminary was organized at Philadelphia, and Rev. Samuel B. Wylie (1773-1852) was chosen professor. He graduated at Glasgow, 1797, and was ordained at Ryegate, Vermont, June 25, 1800, the first Covenanter minister ordained in America. He was pastor in Philadelphia, 1801-52, and for seventeen years a professor in the University of Pennsylvania. In 1823 the constitution of the supreme judicatory was altered, and a General Synod was formed, delegates chosen by the Presbyteries. The General Synod met in New York city, Aug. 2, 1825. The Presbyteries were grouped under two subordinate Synods, Aug. 12, 1831, those east of the Allegheny Mountains forming the Eastern Subordinate Synod, and those west of the mountains the Western Subordinate Synod. The growth of the church up to this period had been steady.

The scattered Covenanters in the British maritime provinces had been visited by a committee of the Northern Presbytery in 1821, Rev. James R. and Rev. Samuel M. Willson, and organized into societies. Missionaries came out in answer to appeals. Rev. Alexander Clarke (1793-1874) came from Ireland to St. John in August, 1827, Rev. William Sommerville (1800-78) and Rev. Andrew Stevenson (1810-81), then a catechist, in 1831. All these men were sent out by the Synod of Ireland, and a Presbytery was formed, April 25, 1832, under its care.

II. *The Division of 1833.*—The year 1833 marks a division in the Covenanter Church. All were united in their testimony in 1806. The Covenanters who stood out in 1782 from the union with the Associate body were justified in their caution when the national constitution was adopted in 1787. It did not embody the principles they had sworn to maintain. The *Testimony* of 1806 says of it: "There are moral evils essential to the Constitution of the United States, which render it necessary to refuse allegiance to the whole system. In this remarkable instrument there is contained no acknowledgment of the being or authority of God, there is no acknowledgment of the Christian religion, or professed submission to the kingdom of Messiah. It gives support to the enemies of the Redeemer, and admits to its honors and emoluments Jews, Mahometans, Deists, and Atheists. It establishes that system of robbing by which men are held in slavery, despoiled of liberty and property and protection. It

violates the principles of representation by bestowing upon the domestic tyrant who holds hundreds of his fellow-creatures in bondage an influence for making laws for freemen proportioned to the number of his own slaves. This Constitution is, notwithstanding its numerous excellencies, in many instances inconsistent, oppressive, and impious." Covenanters dissented, not voting, or holding office under oath to the Constitution, or serving on juries. This position proved uncomfortable during the war of 1812. Covenanters deemed the war justifiable and enlisted. Dr. McLeod preached a series of discourses on the war, vindicating the nation, but "many of the people on the seaboard were aliens, having conscientiously abstained from taking the oath of naturalization, and the government had passed an order for all aliens to remove to a distance into the interior" (*Testimony*, ed. 1881). After the war an inclination to a more charitable view of the Constitution began to appear. *Reformation Principles*, 6th ed., 1871, says: "We have seen that the African slave-trade was abolished and legally declared to be piracy; slave laws were repealed and slavery abolished in the States where most of our people had their abode; new States were rapidly organized where slavery never existed, and was now constitutionally prohibited; thus taking away the principal reason against serving on juries in our courts of law. In several States the highest courts had declared the Christian religion to be the religion of the State, and that to reproach it was a crime against public law, thus correcting the idea of the government being infidel in its character; in the meantime the nature of the federal compact was more perfectly developed and the character of the bond of union among the States better understood." The differences between the older and newer views came to a head at a meeting of the Eastern Subordinate Synod, New York, April 25, 1832. A draft of a pastoral letter came from a committee before the Synod. This argued against charging infidelity and immorality upon the Constitution. This part of the letter was stricken out by the synod. The minority published the original draft with notes. This led to the exercise of discipline, which resulted in the division of the church at the meeting of the General Synod at Philadelphia, Aug. 7, 1833. The party holding the views enunciated in 1806 are known as the Reformed Presbyterian Church (O. S.), and their highest court is the Synod. The party holding the later views are known as the Reformed Presbyterian Church (N. S.), and their highest court is the General Synod. These bodies differ in the application of their testimony to the civil institutions of the United States.

III. *The Reformed Presbyterian Church (N. S.).*—In 1835 a mission was established at Saharanpur, Northern India, and Rev. James R. Campbell and wife were sent out. In 1838 a presbytery was constituted there. In 1848 the Book of Discipline was adopted and published, and in 1850 directions for the worship of God, secret, private, and public, together with rules and forms of order, were adopted. In 1868 the General Synod was agitated by the exercise of discipline in the case of Mr. George H. Stuart, of Philadelphia, for using uninspired compositions in the praise of God, the Book of Psalms being taken by the church as the exclusive manual of praise. Previous to this the Philadelphia Presbytery had been divided into the First and Second Presbyteries. The First, to which Mr. Stuart belonged, now suspended its relations with the General Synod, while the other approved the synod's action. The former presbytery was represented as an independent body in the alliance of Reformed Churches holding the Presbyterian system, at the Philadelphia Council, 1880, but went into the Presbyterian Church in 1885. The relation of the General Synod to the work in India was interfered with during the period from 1868 to 1883, but was renewed in 1883 by the appointment of

Rev. George Scott, a native, who had been educated by the United Presbyterian Church of the United States. The centre of work is Roorkee, with outstations. The Theological Seminary of this church is in Philadelphia.

The terms of communion number six. The second names, as the subordinate standards, the Westminster Confession of Faith, Catechisms Larger and Shorter, and Reformation Principles, the Testimony of the Church, as embodying according to the word of God the great principles of the Covenanted Presbyterian Reformation, to the maintenance of which this church is obliged by solemn covenant engagements.

The minutes of the General Synod, 1888, show 6 presbyteries, 46 congregations, and 24 ministers. The number of communicants is not given.

IV. *The Reformed Presbyterian Church (O. S.).* The arrangement of a General Synod and two subordinate synods was abolished June 26, 1840. The synod composed of all the ministers of the church and a ruling elder from each session was restored Oct. 6, 1841, and has met annually since 1861, as the supreme judicatory. The office of the deacon was long discussed in this church. Though recognized in the form of church government and the testimony of the Reformed Presbyterian Church, it had fallen into abeyance. The office was revived in 1857. In 1888 women were adjudged eligible to this office. The year 1847 witnessed the entrance on foreign mission work. Choice was made of Hayti and Rev. Joseph W. Morton was sent out. Within two years the work was abandoned, owing to his change of church relation. In 1856 Syria was chosen and Rev. Robert J. Dodds and Rev. Joseph Beattie were sent out. They labored first at Zahleh, but finally settled at Latakiah on the coast, which is now the centre of a large work among the Nusairiyeh. This mission has charge of the work at Suadea, at the mouth of the Orontes, known as the William Holt Yates Mission, from its founder, an Englishman, his widow contributing to its support. In 1883 Rev. David Metheny, M. D., removed from the Latakiah field, and took up new work at Tarsus, Adana, and Mersine in Cilicia, among the Arabic-speaking population. This church sustains missions to the Freedmen in Alabama and to the Chinese in California.

The Theological Seminary of this church is at Allegheny, Pa. The denominational college is at Beaver Falls in the same State, and is known as Geneva College. A course on political philosophy and Christian politics forms a special feature.

The terms of communion are six, and numbers 2, 3, 4, 6 specify, as accepted, the Westminster Confession of Faith, Catechisms Larger and Shorter, Form of Church Government and Directory for Worship of the Westminster Assembly, the Covenant of 1871, and the Testimony. The Covenant of 1871 was sworn and subscribed by the ministers and elders at the synod of that year in Pittsburg, Pa., and was afterwards taken largely throughout the church and is given in the last edition of the Testimony. The statistics of 1888 show 11 presbyteries, 121 congregations, 116 ministers, and 10,970 communicants.

Reformed Presbyterians were one in the Union cause during the civil war, and many served in the army as during the war of 1812. In 1800 it was decided that "no slaveholder should be allowed the communion of the church;" in 1823 a testimony was lifted against the oaths of Free Masonry, and this was enlarged in the Covenant of 1871 as against all secret oath-bound associations; in 1836 total abstinence was recommended, and this was embodied in the Testimony in the year 1883.

REICHENBACH, HEINRICH GOTTLIEB LUDWIG (1793-1879), German naturalist, was born at Leipsic, Jan. 8, 1793. He studied medicine and the natural sciences in the university of his native city, and was made, in succession, doctor of philosophy and of medicine, and professor-adjunct. In 1820 he accepted a call to the chair of natural history in the medical school of Dresden, which he held till 1862. He established the botanical garden there and completely rearranged the zoological museum. He proposed a new system of plant-classification based on purely genetic characters, and dividing the whole vegetable kingdom into 8 classes in accordance with the development of the organs, his system being thus akin to those of Jussieu and De Candolle. His principal works are: *Conspectus Regni Vegetabilis* (Leipsic, 1828); *Flora Germanica Excursoria* with his *Handbuch des natürlichen Pflanzen-System* (Leipsic, 1837); and associated with these his *Iconographia Floræ Germanicæ* with 2700 colored engravings (vols. 1 to 22, Leipsic, 1823-84). In the department of zoology he published *Regnum Animale* with 79 engravings (Leipsic, 1834-36); *Deutschlands Fauna* (2 vols., 1842); and *Die Vollständigste Naturgeschichte des In und Aus-landes* (Leipsic, 1845). He died March 17, 1879. His son, **HEINRICH GUSTAV REICHENBACH**, born Jan. 3, 1824, also became professor of botany and director of the Botanical Garden at Hamburg. He is the author of several monographs on the Compositæ and the Orchidaceæ.

REICHENBACH, KARL VON, BARON (1788-1869), German naturalist and technologist, was born Feb. 12, 1788, at Stuttgart, Wurtemberg, where his father was court-librarian. He studied at Tübingen, where he received the degree of Ph. D. His project for the establishment of a German settlement in the South Sea Islands was suspected by the French to have some hidden political significance, and he was seized in Tübingen and committed for some months to the fortress of Hohenasperg. On regaining his freedom he devoted himself wholly to the natural sciences and their application to the industrial arts. After visiting the leading manufacturers in Germany and France, he engaged in charcoal-making at Villingen and Hansach. In 1821, in conjunction with Count Hugo of Salm, he established iron-works and other manufactures at Blansko, Moravia, by his skilful and economical management of which he acquired a large fortune. This he invested in the purchase of large estates at Keisenberg, interesting himself largely in the rearing of silkworms and the production of beet-root sugar. In 1839 the king of Wurtemberg conferred on him the rank of baron. He is famed chiefly for his investigations into the compound products resulting from the distillation of organic substances, and as the discoverer of creosote and paraffin, and of a supposed new force in nature which he denominated Od. He died Jan. 19, 1869. Among his literary productions may be noted: *Geologische Mittheilungen aus Mähren* (1834), the first geological monograph published in Austria; *Das Kreosot* (Halle, 1833); an edition of the works of Schweigger-Seidel (Leipsic, 1835); *Die Dynamide des Magnetismus* (1840); *Der Sensitive Mensch* (1854); *Odisch-magnetische Briefe* (1855); *Odische Erörterungen* (1856), besides many contributions to scientific periodicals.

REID, SAMUEL CHESTER (1783-1861), the designer of the present American flag, was born at Norwich,

Conn., Aug. 25, 1783. He went to sea when only eleven years old and being captured by a French privateer was detained for six months. He was afterwards a midshipman in the U. S. navy, and in the war of 1812 commanded the privateer brig General Armstrong, having 7 guns and 90 men. On Sept. 26, 1814, in Fayal Roads, he was attacked by the boats of a British squadron, but defeated them with a loss of over 200 men, while his own was only 2 killed and 7 wounded, though he was obliged to scuttle his vessel to prevent its capture. The attack on the Armstrong was long the subject of diplomatic controversy, but the case was finally decided by the arbitration of Louis Napoleon, when president of the French Republic, in favor of the British. Capt. Reid was made a sailing master in the U. S. navy, and in later years was also warden of the port of New York. For his connection with the U. S. flag see article **FLAG**. He also invented the signal arrangements formerly in use between Sandy Hook and the Battery in New York harbor. He died at New York, Jan. 28, 1861.

REID, WHITELAW, journalist, was born at Xenia, Ohio, in 1837. His father, a strict Covenanter, had been one of the founders of the town. Whitelaw graduated at Miami University in 1856 and entered the field of journalism. His brilliant letters to the *Cincinnati Gazette* signed "Agate" soon made him widely known. On the outbreak of the civil war he served as a volunteer aid in West Virginia, and was war correspondent with the Army of the Cumberland and the Army of the Potomac. At the close of the war he travelled throughout the South, and for a few months tried cotton-planting in Louisiana. He then became one of the proprietors of the *Cincinnati Gazette*, but in 1868 was called by Horace Greeley to be his associate in editing the *New York Tribune*. As managing editor he displayed force and skill in gathering news. When Greeley was nominated for the Presidency in 1872 the control of the paper was placed in Reid's hands, and there it has since remained through various changes of ownership. Having renewed cordial relations with the Republican party, he has made the paper a leading exponent of its policy. His books comprise *After the War* (1866); *Ohio in the War* (2 vols., 1868); *Memorial of Horace Greeley* (1873).

REINISCH, LEO, Austrian Egyptologist, was born at Osterwitz, Styria, Oct. 26, 1832. He was educated at Gratz and at the University of Vienna, and devoted himself to Egyptology. In this department of that university he was made professor extraordinary in 1868, and professor ordinary in 1872. He has made several journeys to Africa, and in 1865 with Lepsius he discovered the bilingual inscription at Tanis. In 1866 Reinisch accompanied the Emperor Maximilian's expedition to Mexico. Since 1873 he has devoted attention chiefly to the languages of East Africa, and has prepared several grammars and dictionaries of them which have been published by the Academy of Vienna. Besides several monographs on Egyptian subjects he prepared *Aegyptische Chrestomathie* (2 vols., 1873-75).

REINKENS, JOSEPH HUBERT, a German Old-Catholic bishop, was born at Burtseheid near Aix-la-Chapelle, March 1, 1821. He was educated at Bonn, and studied theology at Cologne and Munich, taking his doctor's degree at the latter in 1849. He began to teach history at Breslau in 1850, and became professor of theology there in 1857. He was also preacher in the cathedral from 1852 to 1858. In 1870, having published an essay on *The Pope and his Power according to St. Bernard*, he was warned by the Prince-bishop Förster, who also sought to hinder the publication of his treatise on *Papal Infallibility*. On August 26, at Nuremberg, Reinkens joined with Dollinger and others in a declaration against the Vatican Council. To the subsequent controversy Reinkens contributed some six pamphlets, which were collected under the title *The Papal Decree of July 18, 1870* (1871). At the Old-

Catholic Synod at Cologne in 1873 Reinkens was elected bishop, and was consecrated on August 11, at Rotterdam, by the Jansenist bishop Heykamp of Deventer. He was acknowledged by Prussia, Baden, and Hesse, and made Bonn his see. His oratorical ability was employed in extending the movement for some time with marked success. In September, 1876, he consecrated Bishop Herzog in Switzerland. Among his publications may be noted *Revolution und Kirche* (1876); *Ueber Einheit der Katholischen Kirche* (1877). He also published some treatises on *Clement of Alexandria* (1857), *Procopius* (1859), *Hilary of Poitiers* (1864), *Martin of Tours* (1866), *Aristotle on Art* (1870), *Louise Hensel* (1877), *Lessing on Toleration* (1883).

REIS, PHILIPP (1834-1874), a German physicist, regarded by some as the inventor of the telephone, was born at Gelnhausen, Jan. 7, 1834. He was educated at Frankfurt and was employed in a color-factory there, but pursued with ardor mathematical and scientific studies. In 1858 he became a teacher in an institute at Homburg, and there constructed an instrument by which sound could be transmitted to a distance. This has been called the first telephone, though Reis did not use the name, nor did his contrivance transmit speech. Reis died Jan. 14, 1874, before any public interest was shown in his work. For a full account of his career and invention see the *Popular Science Monthly*, August, 1883, and *Philipp Reis*, by S. P. Thompson (London, 1883).

RELIGIOUS LIBERTY is a special application of the general law of personal liberty, which affirms the right of every man to exert his powers freely at the dictate of his own sense of duty or self-interest, restrained only by regard for the rights and just claims of others. As applied to mental action, the principle demands freedom of thought and of expression by speech or writing; and in the sphere of religion, freedom of opinion, of teaching, and of worship, implying the right, as before the law, to be of any or of no religion. But as religion has regard to men's supreme duty and interest, calling into exercise the deepest sense of obligation, religious liberty is the highest and most sacred form of personal liberty. Out of the recognition of personal religious liberty grows by a natural evolution the right of association. Persons of the same religious faith unite to form a church. Complete spiritual freedom includes the freedom of churches not only to maintain public worship but to establish terms of membership and rules of discipline. For the state to intermeddle with or impede the administration of church discipline would be a deprivation of the just liberties of its members. Religious liberty differs from toleration, with which it is often confounded. The power to grant toleration implies the power to refuse it. Thus the English Toleration Act, as originally framed, refused toleration to Roman Catholics and to Unitarians, and it was not till a recent period that those exceptions were removed. It is also to be distinguished from religious equality. To establish by law and maintain by general taxation any form of religion—so long as the free exercise of other religious forms is permitted—violates equality but is no invasion of religious liberty. In these definitions and distinctions, it may be necessary to state, liberty is viewed as the alternative of restraint imposed under forms of law. There are moral restraints which infringe no man's rights. One who advocates unpopular opinions must run the risk of becoming personally unpopular, involving various degrees of social isolation. This, however unpleasant to bear, is not persecution. Nor is it an infringement of any one's liberty to subject him to ecclesiastical censure according to the rules of the denomination to which he belongs by voluntary adhesion. But penalty, privation, or civil disqualification inflicted by law for the profession of any form of religion is a denial of religious liberty.

Personal liberty in all its forms, regarded as the

right of every man, is essentially a modern idea, and its recognition is still far from being world-wide. In the ancient civilizations all rights of the individual were held subordinate to the prerogative of the state. It was found that the absolutism of a popular assembly could be as oppressive as that of an emperor. Against the absolute state, whether republican or imperial, the individual had no rights. Christianity by its doctrine of personal duty, of personal redemption, and of personal responsibility to the divine judgment, attached an infinite value and dignity to every human soul, from which the acknowledgment of personal rights was a necessary though not an immediate inference. The hierarchical organization of the church, and its alliance with the empire, tended again to subordinate the individual to the catholic whole. Augustine gave the weight of his authority in favor of treating heresy as a crime against the state. The fatal precedent bore its fruit in making spiritual despotism the law of Catholic Europe. The Reformation carried in its bosom the spirit of revolt against ecclesiastical authority, but not positive faith in the freedom of the soul. The Reformed Churches, in close alliance with the state, continued the rule of intolerance, which was affirmed in their confessions of faith. The Formula of Concord, for example, declares concerning the Anabaptists that they "are divided into many sects, of which some maintain more, some fewer errors. Nevertheless, in a general way, they all profess such a doctrine as can be tolerated neither in the church, nor by the police, nor in daily life (*neque in Ecclesia, neque in politica, neque in œconomia tolerari potest*). The First and Second Helvetic Confessions fulminate in like manner against all who bring in or follow "strange doctrines." The French and Belgic Confessions are equally explicit; the Scotch Confession of 1560 goes so far as to affirm that to kings, princes, rulers, and magistrates chiefly and principally pertains the conservation and purgation of religion, and that they are appointed for the maintenance of true religion and for suppression of idolatry and superstition. The Westminster Confession, with its characteristic fullness of thought and terseness of expression, declares that "the magistrate hath authority and it is his duty to take order that unity and peace be preserved in the church, that the truth of God be kept pure and entire, that all blasphemies and heresies be suppressed, all corruption and abuses in worship and discipline prevented or reformed, and all the ordinances of God duly settled, administered, and observed." The Presbyterian Church in the United States has not received this article of the Confession of Faith, but substituted for it another, more in harmony with the spirit of the later age. The Church of England was a persecuting church, with rare intervals, for three hundred years.

From the bosom of the English church came forth bodies of dissenters, now numerous represented among the popular forms of ecclesiastical life. The Independents (or Congregationalists) protested vigorously against the intolerance of the Established Church. When, in consequence of the Parliamentary War, Episcopacy was suppressed and the Westminster Assembly was called to frame a new ecclesiastical constitution for Great Britain, their Confession of Faith and Form of Government were summarily set aside by the Independents, aided by the weight of Oliver Cromwell's sword. Yet, under the Protectorate, though there was a general toleration, there were significant exceptions. The lenity of the government did not extend to Roman Catholics or Unitarians. Nor was this merely a matter of civil regulation. The Independents had no idea of countenancing any doctrine of complete religious freedom. John Robinson has been canonized by the descendants of the Puritans as a Liberal born out of due time. Yet John Robinson, in several publications, insisted on the duty of the magistrate to maintain true religion and put down religious error. "He may"—such is his remarkable

statement—"alter, devise, or establish nothing in religion otherwise than as Christ hath appointed," but may "use his lawful power lawfully for the furtherance of Christ's kingdom and laws. . . It is true, they have no power *against* the laws, doctrine, and religion of Christ, but *for* the same, if their power be of God, they may use it lawfully and *against* the contrary." A government holding what *he* thought to be the truth, in his judgment, was authorized to maintain it by force. Macaulay scarcely caricatured this theory when he said: "The doctrine which, from the first origin of religious dissensions, has been held by all bigots of all sects, when condensed into a few words and stripped of rhetorical disguise, is simply this: I am in the right and you are in the wrong. When you are the stronger you ought to tolerate me; for it is your duty to tolerate the truth. But when I am the stronger, I shall persecute you; for it is my duty to persecute error." But the light was struggling with the darkness. It has been claimed that Robert Browne, from whom the Independents received the nickname of Brownists, in 1582 affirmed the doctrine of complete religious liberty. The language of Browne is not so unambiguous as could be desired, and he himself returned to the Established Church, and his doctrine, whatever it had been, received no further support from him. A more decisive and outspoken publication was issued in 1614, bearing the title, *Religious Peace: or, a Plea for Liberty of Conscience, presented to King James and the High Court of Parliament by Leonard Busher, citizen of London*. Busher was a Baptist, and in this attitude he was not singular among his brethren, for already in 1611 a Baptist *Confession of Faith* had been put forth containing this declaration: "The magistrate is not to meddle with religion or matters of conscience, nor compel men to this or that form of religion; because Christ is King and Law-giver of church and conscience."

The next representative of the principle is Roger Williams, who was banished from Massachusetts in 1638 for maintaining it, and who has the honor of being the first legislator to make it part of the fundamental law of a state. Bancroft, in his *History of the United States*, represents him as the first asserter of the doctrine, an honor which cannot be claimed for him in the light of history. He was a stalwart defender of the principle against Rev. John Cotton, who assailed it. The growth of the American colonies was marked by a vigorous growth of sentiment favorable to the fullest civil and religious liberty and a passionate attachment to it. Under the lead of Franklin, whose liberality in several directions placed him in advance of his age, and of Jefferson, who is justly venerated as the father of religious liberty in Virginia, this became the prevailing spirit of American thought.

The legislative history of religious liberty is a history of crimes against it, and of painfully slow concessions to its spirit. Holland was the first of modern states to establish the policy of toleration, which is the nearest approach to religious liberty known to Europe. Queen Mary of England, the Roman Catholic, is sadly immortalized as the "Bloody Mary" for her sanguinary persecution of Protestants. But Queen Elizabeth, the Protestant, made a sanguinary persecution of Roman Catholics; and she and her successors until the Revolution of 1688—Cromwell excepted—kept the Protestant nonconformists under the pressure of the most abominable penal laws. The attempt to impose Episcopacy upon Presbyterian Scotland more than once brought the kingdom to the brink of civil war. The original Toleration Act, of 1689, grudgingly passed and loaded with invidious restrictions and exceptions, has been, by gradual amendment, made so ample in its provisions that, while its original theory is unretracted, it practically amounts to entire religious freedom. On the conti-

nent of Europe toleration is the general rule, but there are some exceptions. France now tends towards a complete secularization of the state. The Spanish constitution provides for toleration, but the administration locally falls short of redeeming the promise. The same is true of Austria and of some of the German states. The gloomy autocracy of Russia is as severe and unbending in the ecclesiastical as in the civil sphere.

A New World was needed for the full growth of the new idea. For both the theory and the practice of religious liberty and of religious equality we must look to these United States, of which the first to profess and act upon it was, as we have seen, Rhode Island. Maryland was founded on a policy of liberal toleration, but the charter contained no sufficient guaranty of it, and the subsequent legislation of the colony at one time leaned to a contrary policy. Pennsylvania was the next in succession to grant liberty of conscience, which was essentially involved in the Quaker theory of religion professed by its founder. Virginia had originally an established church with some of the intolerance of the mother church of England at that period, but under the combined action of religious dissent and of religious indifference its power was curtailed, and when the State constitution was formed, its Bill of Rights became the recognized creed of civil and religious liberty for all the States. It was copied in other State constitutions and in the first ten amendments to the Constitution of the United States. Massachusetts, under her colonial charter, was as intolerant as any Roman Catholic state. We have seen Cotton defending a persecuting policy against Roger Williams. When Gov. Dudley died, in 1653, there were found in his pocket some lines of verse, which included the following:

"Let men of God, in courts and churches, watch
O'er such as do a toleration hatch,
Lest that ill egg bring forth a cockatrice,
To poison all with heresy and vice.
If men be left and otherwise combine,
My epitaph's, 'I died no libertine.'"

When Cromwell was proposing toleration in England, a synod in Massachusetts protested against the measure as "licentious." Nathaniel Ward, pastor at Ipswich, published in England his *Cobbler of Agawam*, fiercely denouncing it. "I lived," he says, "in a city where a Papist preached in one church, a Lutheran in another, a Calvinist in a third; a Lutheran one part of the day, and a Calvinist the other, in the same pulpit. The religion of that place was but motley and meagre and their affections leopard-like." He insisted on the old maxim, that religion is *ignis probationis*—a test of fire. It is an interesting study to trace the successive steps by which from this condition of public sentiment Massachusetts became the home of religious liberty and equality. The principle is at length rooted in the convictions of the American people. With every advance in popular government, in the Old World as in the New, the emancipation of the intellect and the conscience keeps pace with the general progress.

The constitutional defences of religious liberty in the United States are not as complete as they are popularly supposed to be. The Constitution of the United States provides (Article I. of Amendments) that "Congress shall make no law respecting an establishment of religion or prohibiting the free exercise thereof." This, however, imposes no restriction upon the States, and it is well known that at the time of the adoption of this article there were in more than one State religious establishments. Connecticut, in 1818, disestablished her Congregational churches. Massachusetts followed, but not till 1833. The State constitutions all contain provisions guarding the rights of conscience and establishing religious equality. But State constitutions are amended with facility, and, as

the question of their amendment is local, it is conceivable that in very possible contingencies a State might efface the provisions that recognize religious freedom as among the inalienable rights of man. Experiences has shown that political alliances with churches are more likely to be made by State and city governments than by the government of the United States. Payments might be made from a city treasury to a favored church without attracting any wide public attention; and, on the other hand, a church might secure virtual control of local governments, manipulating them for its purposes. As only the State constitutions stand between the people and such betrayal of their rights, it is worthy of consideration whether additional security is not possible and desirable. An amendment to the Constitution of the United States, to the effect that "No State shall make any law for the establishment of religion, or prohibiting the free exercise thereof," thus extending to the States the restriction now imposed upon Congress, would be a wholesome preventive of insidious local encroachments upon the public liberties. The Constitution now provides that the United States shall guarantee to every State a republican form of government. A further guarantee to the people of every State against interference with the free exercise of religion would put the essential rights and immunities of the citizen under the guardianship of the whole nation. But the most perfect definitions of rights, and the most precise limitations of power, will be ineffective without an intelligent love of freedom on the part of the people, and a firm resolution to maintain it. In the last resort, constitutional law expresses only the fixed determination of the popular will.

On the general subject see Schaff's *History of the Christian Church*, Vol. VI., p. 51, sq.; Jeremy Taylor's *Liberty of Prophecy*; John Stuart Mill's *On Liberty*. The treatise of Leonard Busher, above referred to, has been republished in the collections of the Hansard Knollys Society, England. The treatises of Roger Williams have been reprinted by the Narragansett Club, Providence. As to Robert Browne, see *Congregationalism as Seen in its Literature*, by H. M. Dexter, p. 101, sq. The case of Massachusetts re. Roger Williams is ably stated in Palfrey's *History of New England*, Vol. I., p. 405, sq. For a striking view of the fathers of New England, see Bushnell's *Work and Play*, p. 124, sq. (L. E. S.)

RENAN, JOSEPH ERNEST, French philologist and writer, was born at Tréguier, in the Department Côtes du Nord, Feb. 27, 1823. His parents, pious Catholic peasants, destined him to the priesthood and sent him to the college of his native town. His talents attracted attention, and he was invited to pursue his studies in the Seminary of St. Sulpice, at Paris, then presided over by Abbé Dupanloup, afterwards Archbishop of Bordeaux. He devoted himself with eagerness to the Semitic languages, under Abbe Le Hir, to whom he pays tribute in his *Souvenirs*. But his philological studies caused him to lose faith in Catholic dogmatic theology. In October, 1845, he left the seminary and sought to support himself by giving private instruction. His sister, a governess, came to his aid, and gave him 1200 francs, her entire savings. In 1848 at an examination for a fellowship in philosophy he took the highest rank, and the Institute awarded him the Volney prize for a dissertation on the Semitic languages. In 1849 the Academy of Inscriptions sent him on a literary mission to Italy, where he obtained materials for an important work on Arabic philosophy, *Averroès et l'Averroïsme* (1852). Another work of the same time on the Greek of the Middle Ages was crowned by the Academy. In 1851 Renan was installed in the manuscript department of the National Library. In 1856 he was chosen a member of the Academy of Inscriptions. Within a few years he published a translation of the Book of Job, with an essay on its age and character (1858), and a similar work on the Canticles (1860). He had been

also a diligent contributor to reviews and periodicals, and from these he had collected two volumes, *Études d'histoire Religieuse* (1857); *Essais de Morale et de Critique* (1859).

In 1860 the French government sent an army to Syria and in accordance with precedent sent also a scientific commissioner to that ancient land. To Renan, as the foremost Semitic scholar, was afforded the opportunity of exploring Tyre, the Lebanon, and Palestine. On his return he was appointed professor of Hebrew in the Collège de France, but his introductory lecture was attended with such disorder that the course was suspended. In 1864 he was dismissed after the appearance of his famous book, the religious result of his visit to the Holy Land, the *Vie de Jésus*. The work circulated with astonishing rapidity, but the outcry against it was most vigorous. Duruy, the minister of public instruction, tried to conceal the removal from the professorship by appointing him to a position in the Imperial Library, but Renan refused to accept. After the downfall of the Empire he was restored on the unanimous request of the faculty of the Collège and of the Institute. In 1883 he was made administrator of the college. His wife and daughter have cheered him in later life as his sister did at the commencement of his career.

The *Vie de Jésus* was intended to be the introduction to a history of the origin of Christianity. This design was carried out in *Les Apôtres* (1866); *Saint Paul et sa Mission* (1867); *L'Antéchrist* (1873); *L'Eglise Chrétienne* (1879). He published also official reports of his mission to Phœnicia, discussions of Oriental and archaeological subjects, and contributions to the literature of the day. The latter were partly collected under the title, *Questions contemporaines* (1868). In 1878 Renan was elected to the French Academy, and in his inaugural address in April, 1879, he touched with trenchant satire certain defects in German scholarship and literature. In 1880 he became an officer of the Legion of Honor, a position from which the obstinacy of Pres. MacMahon in refusing to sign the decree had excluded him for months. In the same year he delivered the Hibbert lectures in London, taking for his theme *The Influence of Pagan Rome on Christianity*. Closely connected with these is his *Marc Aurèle et la fin du monde antique* (1881). Renan has written charming autobiographic sketches under the title, *Souvenirs d'Enfance et de Jeunesse* (1883), which have appeared in English as *Recollections of My Youth*. Some dramas from his pen in later years appear to indicate a depraved imagination. His latest works are 1802, a panegyric of Victor Hugo (1886), and *Discours et Conférences* (1887).

The *Vie de Jésus* totally ignores any divinity in the Founder of the Christian religion, yet some critics have regarded it as an elaborate tribute to his character. It was utterly different from the mythical theory propounded in Strauss's *Leben Jesu*, but it was a more insidious attack on Christian belief. Combining his own youthful experience in Brittany with his mature study and sympathetic observation of Oriental life and scenery, Renan presents Jesus of Nazareth as a Jewish philosopher of mystical tendency; in fact, what he himself might have been had he lived in the Roman province of Judæa. The central figure moves under the brilliant light of a cloudless Eastern sky. The consummate art of the portrait seems but the poetic rendering of the truth of nature. Yet the picture remains French in its idea, its accessories, and its limitations. It has the feminine tone characteristic of French emotion. Worst of all, while professing love for the person of Jesus and reverence for his character, it taints his moral purity. The intense and deadly hostility of the attack on Christianity was felt at once by both friend and foe. All France, and soon all Europe, was roused, and numerous replies to the work, of various degrees of ability, were prepared. Yet outside of France it has had little real effect and

the later works for which it led the way are but little known and seldom named. Infidels of other nations demand a coarser and stronger polemic against Christianity. But in France the exquisite grace of Renan's style and the charm of his poetic fancies will enable him to hold a foremost place among her writers.

(J. P. L.)

RENO, JESSE LEE (1823-1862), general, was born at Wheeling, W. Va., June 20, 1823. Appointed cadet from Pennsylvania, he graduated at West Point Academy in 1846, and entered the ordnance department. He was engaged in the Mexican war, and by his gallantry won brevets at Cerro Gordo and Chapultepec, being wounded at the latter. He was afterward assistant professor of mathematics at West Point, and was employed in the Coast Survey and on other duty. He was ordnance officer in Gen. A. Sidney Johnston's expedition to Utah. On the outbreak of the civil war he remained faithful in his allegiance, and in November, 1861, he was made brigadier-general of volunteers. He took part in Burnside's expedition to North Carolina, fought at Roanoke Island, and assisted in the capture of New Berne. In July, 1862, he was ordered to reinforce McClellan's army, and he afterward joined Gen. Pope's army. Having command of the Ninth Corps, he fought near Manassas. When McClellan was again appointed to the chief command, Reno was in the advance and engaged the enemy at South Mountain, Md., Sept., 14, 1862. By his gallantry and activity he contributed to the victory, but was killed before the close of the day.

RENOUF, PETER LE PAGE, an English Orientalist, was born on the Island of Guernsey, in 1824. He was educated there at Elizabeth College and afterward at Pembroke College, Oxford. In 1842 he became a Roman Catholic, and when the Catholic University of Ireland was opened in 1855 he was made professor of ancient history and Oriental languages. Here he also assisted in editing *Atlantis* and the *Home and Foreign Review*. In 1864 he was appointed an inspector of schools, and held this position for many years. His work on *The Condemnation of Pope Honorius* (1868) was attacked by the Roman Catholic press and was placed on the *Index*, but Renouf maintained and defended his position. He had previously published some controversial works, but his principal work has been in Egyptian philology. He delivered the Hibbert lectures in 1878 on *The Ancient Religions of Europe*. In 1885, on the death of Dr. Samuel Birch, Renouf was appointed keeper of the Egyptian antiquities in the British Museum.

RENWICK, JAMES (1790-1863), physicist, was born at Liverpool, England, May 30, 1790, but was early brought to New York city. He graduated at Columbia College in 1807, with the highest honors, and in 1810 he returned to lecture on natural philosophy. In 1817 he was made a trustee of the college, but in 1822 he resigned that position on being appointed professor of experimental philosophy and chemistry. He did much to diffuse in the United States the knowledge of natural sciences by his textbooks. His *Outlines of Natural Philosophy* (2 vols., 1832) was the first important treatise on that subject in this country, and his *Outlines of Geology* (1838) had a similar precedence. He also published *Elements of Mechanics* (1832) and *Practical Applications of Mechanics* (1840). His *Treatise on the Steam-Engine* (1840) was highly esteemed as a practical guide. In the field of biography he was also a diligent laborer, preparing *Lives of Fulton, Rittenhouse, Count Rumford, De Witt Clinton, Jay, and Hamilton*. In 1838 he was one of the U. S. Commissioners appointed to explore the region of the North-East Boundary. In 1853 he resigned his professorship, but continued in other ways his labors for the advancement of science and its practical applications. He died at New York, Jan. 12, 1863.

His son, **JAMES RENWICK**, born Nov. 3, 1818, gradu-

ated at Columbia College in 1836, and became a civil engineer. He was engaged in work on the Erie Railway and the Croton Aqueduct. Afterwards becoming an architect, he constructed Grace Church, St. Patrick's Cathedral, the building of the Smithsonian Institution, the Corcoran gallery at Washington, Vassar College, and other buildings.

REPRESENTATION. Popular governments, in which the mass of the people of a community participate in the exercise of public authority, usually exhibit two methods of exercising such popular function. In small communities the direct participation of the people in the enactment of laws and the control of administration, acting together in public assemblies, is practicable and frequently exists, but where the numbers participating in such government exceed what could be conveniently assembled for such purpose, and where the distances to a place of common meeting are too great to admit of the assembling of a considerable portion of the citizens, the necessity exists for delegating authority to certain selected persons to perform such duties in the name and with the authority of such community. The persons thus selected for the purpose of enacting laws to regulate the affairs of the community are designated representatives, and the relation in which they stand to the citizens from whom their authority is derived is expressed by the term representation.

Every agency in which one acts in the name and with the authority of another is an instance of representation, in the general sense of the term, but political agencies attended with a delegation of authority to make laws are properly expressed by the term representation in its institutional sense. According to general usage, this implies a legislative body consisting of representatives who deliberate and act together, in one or more assemblies, by the votes of some predetermined number or proportion of the whole assembly. Governments in which the whole body of the citizens act together directly in the enactment of laws are described as pure *democracies*, while those that have legislative bodies composed of representatives chosen by the people are designated as representative popular governments, and very commonly as *republics*.

While the theoretical origin of representation traces the institution to the necessities of large and populous communities sustaining popular institutions, the historic origin is in the causes that transferred the source from which legislative authority was derived from monarchs, dignitaries, and privileged classes to the body of the people or some considerable part of that body. In the great governments of Europe the admission of the citizen to the individual right of participating in the choice of representatives is of modern origin, and was preceded by the indirect exercise of that right as a member of some municipality or other political community or of some organization of a mixed political and industrial character. Popular representation owes its establishment largely to the necessities of the governing classes for money, and the struggle by which in England it obtained definite and fixed recognition has associated together the ideas of taxation and representation as having a peculiar connection, while in an accurate sense all the powers of government are equally related to representation as the proper means of their exercise.

Popular representation in America was directly derived from the English system transferred to this country and implanted in the first colonial governments. The condition of the colonies admitted of no other system conformably to the customs of England, as the populations of the colonies were scattered over wide areas and were homogeneous and without class differences to serve as the foundation of oligarchical institutions. From the colonial governments popular representation passed into the government of the United States and of the respective States under the Articles of Confederation, and thence into the existing

governments of the United States and of the States at the formation of the Constitution.

We find in examining the representative system as it exists in the United States two modes of representation, both of which may be termed popular, but differing from each other as direct and indirect. The representation in the House of Representatives of the Congress of the United States is of the direct kind, while that in the Senate of the United States is indirect. In both cases the people of the States are the sources from which the representation is derived, but in the one case they exercise a direct choice of the representatives through a popular election, while in the other that choice is made by the Legislature of the State, and yet as that Legislature is the product of popular election, it may still be regarded as popular in its nature although indirectly exercised by the people.

The members of the U. S. House of Representatives are chosen by the people in congressional districts, each State being subdivided to make such districts. The Senators, on the other hand, are chosen by the Legislatures of the several States. The congressional districts from which members of the House of Representatives are chosen are not organized communities, but merely geographical divisions of population. As the people of these districts do not act together as a distinctive community, exercising municipal power, it is to be concluded that their choice represents a collective body of individual preferences. On the other hand the selection of the U. S. Senators is the act of the agents of government of a State, chosen by the people of the State for objects having direct relation to the local interests of such State. It will be found, when considering the representative system of certain of the States, that the U. S. House of Representatives has a more distinctly popular character, as proceeding directly from popular choice, independently of the effects of local organization, than prevails in the legislative bodies of the States, and that the Senate of the United States is the only legislative body in the United States that is based upon the governmental action of organized communities.

Of these two methods of deriving representation that which proceeds from the action of organized communities through their local governmental agencies appears to be that most intimately related to forms of government that preceded popular institutions. Such modes of representation are found in federated states that have a common administration of such interests as are in common among them, and indeed prevail where independent states are represented in consulting bodies acting in the common interest. This mode of representation although popular, as based on popular selection, may be termed *federal*, for although the term federal in its origin expressed the idea of authority derived from a compact or contract, still in its modern use it is applied to relations between organized communities of a governmental nature bound together by a national tie.

We find that, in the early constitution of the British House of Commons, cities and boroughs were distinctively represented as municipal bodies, and that direct popular representation in that body has been the product of the development of liberal ideas in later times.

When the whole people of an organized community that is part of a more general government vote collectively in the choice of representatives to exercise the powers of such general government, it is evident that the local interests of such community will be reflected in the choice made by them to a much greater degree than where such community is subdivided upon geographical rather than upon political lines into districts, each district exercising independently of each other a collective choice of such representatives. While a State or lesser community may maintain a certain line of policy as a whole, it is not to be anticipated that that policy will express the preferences of

each of the various geographical subdivisions into which it may be divided. A choice that rests upon the action of an organized community through its governmental agents may be said to be based upon corporate opinion, while that which proceeds directly from the people, independent of corporate organization, may be said to represent individual opinion. That communities in their organic action do not accurately represent the consequences of individual opinion and sentiment prevailing among their people is commonly observed. Material interests are apt to dominate social ideas in what is here termed corporate opinion, while a better opportunity for the expression of social ideas and tendencies is afforded by direct individual action.

It is apparent from what has been said that the tendency, that is observed in popular governments, to reach a direct expression of individual opinion serves to enhance the social influences as distinguished from those of a material character, while the conservation of methods intimately connected with corporate opinion tends to give coherence to the system, thus combining together progressive and conservative tendencies to produce that dualism without which society would be incomplete.

As has been observed, the constitution of Congress utilizes both of these sources of influence each in its most vigorous form. In the constitution of the legislative bodies of the States of the Union the same general truths are observed, but less distinctly expressed. In Massachusetts the representation in the House of Representatives is based upon the towns, while that of the Senate rests on towns united to form districts, but the choice of representatives proceeds from the people of the towns, and not from their corporate authorities. While this is an instance of direct popular choice, the compact organization of the towns, and the close relation of the action of the town authority to the interest of the people, tend strongly to color the popular choice with the qualities of the prevailing corporate opinion. In New York the legislative representation is based upon counties, the counties being subdivided for the choice of members of Assembly, and united to form districts for the election of senators. The counties of New York are much less compact bodies than the towns of Massachusetts, affecting the interests of the people in a much more limited way, and hence it would follow that individual tendencies would, as compared with corporate tendencies, be more effective in New York than in Massachusetts. The subdivisions of the counties in New York for the formation of districts for the election of representatives to the popular branch of the Legislature tend to give expression to neighborhood interests and opinion, and thus individual opinion is brought under the influence of limited local causes.

The instances of Massachusetts and New York may be taken as the types of the systems prevailing throughout the United States, the former principally in New England, and the latter throughout the rest of the United States. It has already been remarked that neighborhood opinion is a factor where small election districts are created, and this affords the reason for the statement already made that representation in the U. S. House of Representatives has a more direct relation to generalized popular opinion than in any of the systems prevailing in the States. The large territorial extent of the congressional districts cancels the influence of neighborhood opinion, while the fact that such districts have no corporate existence for municipal purposes tends to exclude the domination of corporate opinion, and the result is, or should be, a clearer approximation to a fair generalization of individual opinion. Methods of selection and the influence of party action may and do change these results, but the tendencies nevertheless exist and continue to act, and in long periods of time will produce their proper results.

The government of the United States, considered

as embracing the systems of the States, generalizes all the sources of influence that have been described as corporate, individual, and neighborhood opinion; stated in other language, these include the influences of organized communities, the tendencies of popular sentiment and opinion, and the phase of influence that arises from small and homogeneous districts. Such composite structure of government is undoubtedly demanded by the nature of popular government to modify the result of popular activities without putting restraint upon them. Indeed it is doubtful whether permanent stability may be attained by popular institutions in large communities independent of the federal principle that utilizes all the sources of influence.

In popular governments the choice of representatives proceeds through some form of election, of which there are in use two forms, one calling for an oral expression of choice and the other in which such choice is evidenced by writing or printing. The former of these methods is in limited use and only suited for small and homogeneous communities, while the latter, under the name of voting by ballot, is in most general use, principally for the reason that it admits of the act of voting being performed in a secret manner, thus exempting the voter from responsibility other than to his own sense of duty or interest. Such acts of election are habitually supervised by official persons, whose statements of the result are accredited as entitling the representative certified by them as elected to claim his seat in the legislative body to which he is elected. The ultimate right to determine the sufficiency of such election is in this country habitually in the legislative body, while the elections to the English House of Commons are determined judicially by the courts. The consequence of the mode of determining such questions prevailing in this country is that such questions are more frequently determined on political grounds than in a judicial spirit.

The relation of the representative to his constituents, as it regards his duty of conforming to their opinions and desires in the exercise of his functions, has given rise to much difference of opinion, and is likely to remain a subject of speculative opinion for the want of tribunals competent to bring it to a final solution. In many of the States, as already noticed, the right of the people to instruct their representatives is directly conferred by the State constitutions. The construction of these clauses cannot come into the courts under ordinary circumstances, and they must remain to be expounded by the slow process of the formation of public opinion. It is hardly to be supposed that the expression, *instruction*, as there used was intended in the sense of a binding requirement, but rather as an equivalent of *information*. For the people to instruct their representatives, in the sense of laying them under obligations to act in a particular way, would require that they should act collectively, the whole people of the community participating, as in a convention of the whole people or their selected delegates; but it is not to be presumed that such was the intention of those constitutions that secure to the people the right to instruct their representatives. These clauses are intimately interwoven with others very clearly intended to secure individual rights and the rights of collective bodies of persons less than the whole community, and associated together merely by a common opinion or interest on certain subjects; and certainly individuals and irregular collective bodies were not intended to have a controlling influence on the action of the representatives of the whole people. Where the duty of a representative is pointed out by a clear obligation to the whole community, it is quite plain that it should not be controlled by a portion of that community less than its majority.

That the representative should bring to the attention of the legislative body the sentiments and opin-

ions of the local constituency represented by him seems to be generally conceded; and clearly, where they have a peculiar interest affected by public measures, that interest should be represented and protected by their representatives, unless overborne by superior interests affecting the whole community. While it would seem that so important a feature of a popular system of government as that which relates to the duty of the representative in view of the known wishes of his constituents should be reduced to something like an exact understanding, yet the formation of a common opinion upon the subject is by no means an easy matter under the simplest conditions of such relation, but is seriously complicated through the division of responsibility incident to party organization, which in popular governments appears to be the natural consequence of the effort of opinions and interests to reach the condition of a public policy. (A. J. W.)

REPUBLICAN PARTY. The failure of the two great American political parties, Whig and Democrat, after earnest efforts for a quarter of a century to settle the slavery question by such compromises as would be satisfactory to both North and South, resulted ultimately in the disintegration of the former party and the formation of a new political organization. All attempts at conciliation through legislation were fruitless of satisfactory results, as the Democrats refused to surrender what they claimed as rights under the Constitution and laws that affected the slavery question. Outside of the Abolitionists (*q. v.*), who had never become a prominent factor in politics, the legal right to hold slaves in the several States where slavery existed was not denied, but the question that agitated the public mind at the middle of this century was whether the area of slavery should be extended into the Territories.

The repeal of the Missouri Compromise, which had interdicted slavery north of latitude 36° 30', made Kansas the battle-ground, and the friends of either side exerted themselves to populate and protect that Territory with those of their own political faith. The right of the slaveholders to take their slaves with them into that Territory was denied by the Free State men, on the ground that slavery was a local institution and must be confined to the States where it already existed. On the other hand, the slaveholders claimed the right, inasmuch as slavery was virtually recognized by the Constitution, to carry their slaves to any part of the United States as they could any other property. Thus this question became a direct issue which in the fulness of time brought the Republican party into existence. The Freesoilers of the North formed its advanced guard, and the old Abolition party fell into its ranks.

Public discussion both in and out of Congress, instead of quieting the discordant elements, increased their intensity, and party lines became more rigidly drawn than before. The Whig party won its last national victory in 1848 through a partial coalition with the Freesoilers, but after the death of Pres. Taylor in 1850 Fillmore notably changed the policy of the administration. The Whig party had become effete by its repeated and futile attempts at compromise, while the Free Soil party was young and aggressive, and was founded on a vital issue. When the disintegration took place, the Southern pro-slavery portion drifted to the Democrats, while the anti-slavery Whigs in the North still opposed its old political foe. The presidential campaign of 1852, the last in which the Whig party figured in national politics, was only an exhibition of its weakness. In its platform it was silent on the slavery question, with the exception of an indorsement of the Fugitive Slave law which had been enacted by the Thirty-second Congress. This absurd silence at a time when the public mind was absorbed by the slavery question tended to make its decay more certain and rapid. It received only 42 out of 296 electoral votes.

In marked contrast with the Whigs, the Free Soil party took strong grounds, declaring against any more

slave States or new slave Territories, or the nationalization of slavery or extradition of slaves. It denounced the Fugitive Slave law and demanded its repeal. It alleged further that no permanent settlement of the slavery question could be had except in the practical recognition of the truth that slavery was sectional and freedom national. As an independent party, it refused to coalesce with others, but declared its object to be to defeat both Democrats and Whigs, which it said were hopelessly corrupt. Its motto was "Free Soil, Free Speech, Free Labor, and Free Men."

The Kansas-Nebraska controversy made a rupture in the old Whig party that could not be healed, and the Republican party, then in its infancy, was augmented by the anti-slavery Whig elements. This shift was precipitated by the act of May 25, 1854, which provided a territorial government for Nebraska, which then included what is now Kansas. The struggle for Kansas was the throes of the birth of the Republican party.

The first national convention of the Republican party was held at Philadelphia, June 18, 1856. It was composed of delegates selected under a call addressed to the people of the United States, without regard to their former political creeds or opinions. It invited all those opposed to the repeal of the Missouri Compromise, to extending slavery into free territory, and in favor of admitting Kansas as a free State. It was intended to consolidate the opposition to the Democratic party. The personnel of the party was composed of Whigs with anti-slavery opinions, Abolitionists, Native Americans, and Independent Democrats—in short, of all elements opposed to the pro-slavery Democracy. It proposed, to harmonize these elements in a common cause, to settle the question of the extension of slavery by an appeal to the ballot-box.

In the platform on which the campaign was conducted appeared the following resolution: "That we deny the authority of Congress, of a territorial legislature, of any individual or association of individuals to give legal existence to slavery in any Territory of the United States, while the present constitution shall be maintained." This resolution announced the issue which called the new party into existence. The platform embodied the first principles of American liberty; it maintained the doctrines enunciated in the Declaration of Independence; the preservation of the Federal Constitution; the preservation of the rights of the States; and the Union of the States. It arraigned the administration of Pres. Pierce for its efforts to thrust slavery on the people of Kansas, and demanded the immediate admission of Kansas as a free State. It called for the extinction of polygamy, then rampant in Utah. It advocated aiding the construction of the Pacific railroad; favored liberal appropriations for improvement of our rivers and harbors; and declared in favor of restoring the national policies of Washington and Jefferson. With this creed, the Republican party started out on its mission.

The convention nominated John C. Fremont for President, and William L. Dayton for Vice-President. In November, 1856, more than 4,000,000 votes were cast, being an increase of about 30 per cent. over the previous presidential election. The result showed a surprising strength for the new party. Although James Buchanan, the Democratic candidate, was elected, having received 174 electoral votes against 114 votes for Fremont, and 8 votes for Fillmore, he was in a minority of 377,608 on the popular vote. Fremont received 1,341,234 votes, and Fillmore, 874,534 votes. It is highly probable that without a third party in the contest the Republicans would have elected their candidate.

The elections in 1856 drew party lines more tightly, and incited both political elements to renewed exertions for supremacy. Buchanan's election was a present triumph for the South, but a comparison of the vote with that of four years previous gave his party un-

business and the Republicans hope for the future, for while the Democrats had a plurality of 60 in the electoral college, the popular vote was against them. In 1852 they had a popular majority of about 59,000, and had 212 votes in the electoral college. This change in public sentiment gave the Republicans prestige in their defeat, made them more aggressive, and gained them new acquisitions. This is shown by the address issued Nov. 27, 1856, congratulating the Republicans on their work in the past and urging them to renewed efforts in the future. The address pointed to the fact that in 1852 the Democratic party carried all the States, except four, on the popular vote, while in 1856 they lost eleven States, containing half the population of the Union, and that the Republican candidate received nearly three times as many electoral votes as the Whig party had in 1852, and that it already controlled fourteen of the State governments. As the issues still remained, it was evident that the Republican party would be a formidable antagonist in 1860.

A continuous chain of events favored the new political organization, among which the celebrated Dred Scott case (*q. v.*) stands prominent. The decision in this case not only intensified the feeling throughout the North amongst those already connected with the Republican party, but it also added to its numbers many Democrats who had anti-slavery convictions. This decision denied that which many in the non-slaveholding States claimed, and which they intended, if possible, to secure—the right of Congress, and of the people of a Territory, to control the extension of slavery; it ordained slavery as an irreversible condition; it made slavery national and freedom sectional. What tended to increase popular feeling was the statement that the final decision of the court was the opposite of its original opinion. [Justice Benjamin R. Curtis tendered his resignation to the President because the court first decided the case upon one ground and afterwards agreed to reopen it and decide it on another, which he considered subversive of law. This action destroyed his confidence in that body, and he refused to continue on the bench under those circumstances.]

This famous decision, which was given only two days after Pres. Buchanan entered on office, and which was intended to quench the Kansas struggle, only added fuel to the flame. As a result, war and bloodshed marked the attempts of the two parties to control the incipient State. The election for members of the Legislature was attended with fraud and violence. The Free State adherents held a convention at Topeka to frame a State constitution, but Congress after a fierce struggle refused to admit it as a State. Popular feeling ran high all over the country. The result of the long congressional struggle was simply this: "That Congress was neither to legislate slavery into any Territory or State, nor to exclude it therefrom; but to leave the people thereof perfectly free to form and regulate their domestic institutions in their own way, subject only to the Constitution of the United States, and it was specially prescribed that when the Territory of Kansas shall be admitted as a State, it shall be admitted into the Union with or without slavery as the constitution adopted should prescribe at the time of admission."

What is known as the Lecompton Constitution was subsequently submitted to Congress by Pres. Buchanan in 1858, with a message saying: "Slavery exists in Kansas by virtue of the Constitution of the United States;" and he urged that body to admit it as a State under that Constitution. At a special election the people of Kansas decided by a majority of 10,000 votes not to accept admission under that Constitution. It remained a Territory until 1861, when it was admitted by a Republican Congress under its "free" constitution adopted in 1859.

These events with others intimately related to them

prepared the way for the presidential contest of 1860, and at the same time consolidated the opposition to the policy of the Democratic party. The anti-Le-compton Democracy could not consistently return to the old party, and they were not ready to unite with the Republican party, which had refused to adopt the doctrine of "popular sovereignty" advocated by Stephen A. Douglas. This was a feeble compromise, and would have been fatal to the new party. A backward step would have caused a division in the party, as it would be a surrender of the principle on which it was founded—the non-extension of slavery. In the memorable Douglas-Lincoln debate in 1859 it became evident that popular sovereignty could not be accepted by the Republicans, for the repeal of the Missouri Compromise had placed them in an advanced position. That celebrated discussion and the Kansas troubles did more to consolidate the anti-slavery element than anything which could have happened. The people recognized the irrepressible conflict between freedom and slavery and accepted the words of William H. Seward that "the United States will, sooner or later, become either an entirely slave-holding nation or an entirely free-labor nation."

This was the condition of national politics when the Democrats met in convention at Charleston, April 23, 1860. The Douglas element stood firmly by the doctrine of popular sovereignty, while an almost solid South stood by the Dred Scott decision. This resulted in a double set of resolutions, and that of the Douglas wing was adopted by a majority of 27 votes. After 54 ineffectual ballots the convention adjourned to meet in Baltimore in June, when Douglas was nominated after a split in the convention. Subsequently the Democrats who seceded placed Breckinridge and Lane on their ticket, and thus the Democracy were irreconcilably divided.

After the adjournment of the convention at Charleston, and prior to its assembling at Baltimore, the Republicans held their nominating convention at Chicago. All the Northern States were fully represented, with partial delegations from Delaware, Maryland, Kentucky, Missouri, Virginia, with a few delegates from other Southern States. The proceedings at Charleston presaged a divided Democracy and a Republican victory. The elections of 1856 showed such Republican strength, with the accessions of four years, that the rupture at Charleston made it almost certain that the nominee at Chicago would be elected.

In their convention the Republicans confirmed the platform of 1856, and in view of recent events pronounced more decidedly against the extension of slavery in the Territories. It also advocated a tariff that would stimulate and protect home industries, and it embraced other economic questions.

The platform of 1860 contains the following resolutions or "planks":

7. That the new dogma, that the Constitution, of its own force, carries slavery into any or all of the Territories of the United States, is a dangerous political heresy, at variance with the explicit provisions of that instrument itself, with contemporaneous exposition, and with legislative and judicial precedent—is revolutionary in its tendency, and subversive of the peace and harmony of the country.

8. That the normal condition of all the territory of the United States is that of freedom; that as our republican fathers, when they had abolished slavery in all our national territory, ordained that "no person shall be deprived of life, liberty or property, without due process of law," it becomes our duty, by legislation, whenever such legislation is necessary, to maintain this provision of the Constitution against all attempts to violate it; and we deny the authority of Congress, of a territorial legislature, or of any individuals, to give legal existence to slavery in any Territory of the United States.

11. That Kansas should, of right, be immediately admitted as a State under the constitution recently formed and adopted by her people, and accepted by the House of Representatives.

12. That, while providing revenue for the support of the

general government by duties upon imports, sound policy requires such an adjustment of these imports as to encourage the development of the industrial interests of the whole country; and we commend that policy of national exchanges which secures to the working men liberal wages, to agriculture remunerative prices, to mechanics and manufacturers an adequate reward for their skill, labor, and enterprise, and to the nation commercial prosperity and independence.

The election of Abraham Lincoln was a still greater triumph, from the fact that the Republicans secured both branches of Congress, and this intensified public feeling in the South. As a final attempt to compromise in the interest of slavery, Congress on March 2, 1861, passed a joint resolution proposing an amendment to the Constitution that "No amendment shall be made to the Constitution which will give to Congress the power to abolish or interfere within any State, with the domestic institutions thereof, including that of persons held to labor or service by the laws of said State." Pres. Lincoln in his inaugural address expressed his satisfaction at such an amendment. Ohio and Maryland immediately ratified the measure, but no other States took action on it. It came too late, for secession was already sweeping over the Southern States.

Lincoln sought to calm the storm by promising protection to all the States, and by assuring the people that the security of none should be endangered, but the bombardment of Fort Sumter was the response, and its surrender in April, 1861, notified the people that rebellion and civil war had begun. On the 15th of April the President issued a call for 75,000 troops, and the controversy which legislation had failed to settle was to be decided by force of arms. Through the efforts of the anti-slavery element, compensated emancipation had removed slavery from the District of Columbia, and Pres. Lincoln in order to keep the "Border States" from joining the South proposed the same policy to them. But the practicability and even the constitutionality of the plan was questioned, and Congress took no action on the proposal.

The President's call for troops was responded to by all the Northern States, but evaded or refused by the "Border States." Some complied under certain conditions, such as for home defence. The battle of Bull Run and the defeat of the Union army in July, 1861, intensified the war feeling on both sides, and Mr. Lincoln's administration was sustained by Congress in providing for the emergency. It then authorized the enlistment of 500,000 volunteers; in July, 1862, there was a call for 300,000 and in August following a draft for 300,000 more was ordered. In June, 1863, 100,000 men were called for to resist invasion of Pennsylvania and other loyal States; in October, a call for 300,000; in February, 1864, a draft for 500,000; in March following, an additional draft for 200,000, and in April of the same year 85,000 one hundred days' men were accepted.

The Republicans were the distinctive war party, and they gave support to the demands made by Mr. Lincoln and his cabinet. Southern Senators and Representatives had left their seats in Congress and joined in the rebellion, and hence a large majority of those who remained were in harmony with the administration. As a rule, what the President asked for was granted. He desired to make the war short and decisive, and when he asked Congress for 400,000 men and \$400,000,000 it added one-fourth to each request. Thus the Republican party was as fully the war party during the rebellion as the Whigs were in the Revolutionary war, or the Democrats in the war with Mexico, and in each instance they were sustained by the majority sentiment of the country. This truth is stamped on almost every war measure, and certainly on every political measure incident to the rebellion.

The Thirty-seventh Congress is of historic note because of the era it marks, and also because it concern

trated and crystallized all that formerly was drifting or doubtful in the Republican party. The emergencies of the hour required prompt and heroic treatment, and that Congress had to grasp great and vital questions as they followed each other in rapid succession. Hence it changed the creed of many. It made the rebellious South still more vehement and determined; it separated the Southern Unionists from former friends and built a wall of fire between them. It changed the temper of Northern Abolitionists, divesting them of factious spirit and pride of methods, and compelled them to unite with the Republicans, who were making sure advances, from their original declaration that slavery should remain within present bounds, to emancipation, and finally to arming the liberated slaves. It brought many Northern Democrats into the Republican party, and reformed the political parties of the North. This may be termed the pivotal Congress, for it defined a policy for the Republican party, which, in the main, has been followed to the present day. Prominent amongst the Republicans in that Congress was Charles Sumner, of Massachusetts, scholar, orator, and statesman. Senator Fessenden, of Maine, was a recognized leader until the impeachment trial of Andrew Johnson. Thaddeus Stevens, "the Commoner," was a leader of the House, an Abolitionist in creed and a practical and brave legislator. He was a radical of the radicals, holding that the government could go outside of the Constitution to defend itself from destruction. Schuyler Colfax was one of the rising men in that Congress. He became Speaker of the next House, and subsequently Vice-President of the United States. With him in the House were Justin S. Morrill, the author of the tariff bill which raised hundreds of millions to support the army; Henry L. Dawes, the "man of statistics" and the "watch-dog of the Treasury." Roscoe Conkling was then the leader of the New York delegation; Ohio was represented by Ashley, Bingham, and Sherman. Illinois gave four prominent anti-Lecompton supporters of the administration—Douglas in the Senate, and Logan, McClelland, and Richardson in the House; while Lovejoy and Washburne were stalwart Republicans from that State. At this session Senator Lyman Trumbull reported a bill from the Judiciary Committee of which he was chairman, to confiscate all property and free all slaves used for insurrectionary purposes.

Pres. Lincoln's proposal for compensated emancipation expressed also the opinion of several leading Republicans. He sent to the Thirty-seventh Congress a special message, recommending the passage of the following resolution: "Resolved, That the United States ought to co-operate with any State which may adopt gradual abolishment of slavery, giving to such State pecuniary aid, to be used by such State in its discretion, to compensate for the inconveniences, public and private, produced by such change of system." At a conference with the Senators and Representatives of the Border slaveholding States, held at the Executive Mansion, Pres. Lincoln gave his views on the subject and in his presentation of it he said: "I do not speak of emancipation at once, but of a decision at once, to emancipate *gradually*." Two days later, July 14, 1862, a majority of the representatives of those States sent an official reply, rejecting the proposition. This closed the conference.

It was, however, evident that the institution of slavery must share the fate of those in armed rebellion, and that the Union and slavery could not both be preserved. In September, 1862, the President by his proclamation served notice on the rebel slaveholders that if they did not lay down their arms in the meantime he would on the following New Year's Day declare free all persons held as slaves in the rebellious States. As this preliminary warning produced no effect, the famous Emancipation Proclamation was issued Jan. 1, 1863, "as a fit and necessary war-measure

in suppressing said rebellion." The border States that declined the proffer of compensated emancipation were not included in the proclamation, but in the following year emancipation was made general, without compensation, and those States or portions of States lost all consideration for their slaves. In February, 1864, the Thirteenth Amendment to the Constitution was reported to the Senate, and in May it was passed by that body. In the House it was voted on in June, but did not obtain the necessary two-thirds vote and a motion to reconsider carried it to the next session of Congress.

The Republican convention met in June, 1864, and renominated Pres. Lincoln. Its platform asserted that slavery was the cause and constituted the strength of the rebellion, and, "as it must be always and everywhere hostile to the principles of Republican government, justice and the national safety demand its utter and complete extirpation from the soil of the republic." It also declared in favor of a constitutional amendment prohibiting the existence of slavery within the United States. It pronounced against any compromise with those in arms against the government, except one based on an unconditional surrender, and a return to an allegiance to the Constitution and laws.

The Democrats at their convention held Aug. 30th, when they nominated Gen. McClellan, made a direct issue on the above policy by resolving that as the war had been a failure, "justice, humanity, liberty, and the public welfare demanded that immediate efforts be made for a cessation of hostilities, with a view to an ultimate convention of the States, or other peaceable means, to the end that, at the earliest practicable moment, peace may be restored on the basis of the Federal Union of the United States."

The issue involved was for or against the amendment to the Constitution, or in reality whether slavery should be forever abolished. The Emancipation Proclamation of Pres. Lincoln brought forth these resolutions, and in his letter of acceptance he indorsed the Republican position.

In Pres. Lincoln's second inaugural address, delivered March 4, 1865, he spoke the following words, since often quoted as typical of the kindly disposition of the man believed by his party to be the greatest American since Washington: "With malice toward none, with charity for all, with firmness in the right, as God gives us to see the right, let us strive on to finish the work we are in, to bind up the nation's wounds, to care for him who shall have borne the battle, and for his widow and orphans—to do all which may achieve a just and lasting peace among ourselves and with all nations."

He could well afford to show that generosity, which never comes more properly than from the hands of the victor. His policy was about to end in a great and lasting triumph. In less than five weeks from the day when Lincoln made that utterance Gen. Lee had surrendered the main army of the Southern Confederacy to Gen. Grant at Appomattox on terms at once magnanimous and so tersely and briefly stated that they won the admiration of both armies.

Then followed a grave and responsible political work—the actual reconstruction of the States lately in rebellion. This work gave renewed freshness to the leading political issues incident to the war, and also opened out new issues. It was claimed that Pres. Lincoln had a reconstruction policy of his own because he was so anxious for the admission of Louisiana and Arkansas, but it certainly never had taken definite shape. On April 15th, six days after the surrender of Lee, the President was shot by J. Wilkes Booth at Ford's theatre. The entire nation was appalled at the deed. No man was ever more sincerely mourned by all classes. Even the Southern leaders believed this rash act had lost to them the life of one who had never been harsh, and, while firm, was always generous. The North had looked upon him as "Father

Abraham," and all who viewed the result of the murder from sectional or partisan standpoints thought his policy of keeping with the people would have protected every proper interest. No man in public life ever had less pride of opinion, and had he lived to serve out his term of office it is more than probable he would have shaped events, as he had during the war, to the best interests of the victors and without unnecessary harshness to the vanquished.

The decisive victory at the elections, giving the Republican candidate 212 out of 233 electoral votes, gave the Republicans more aggressiveness, because they had been sustained by such an overwhelming majority. The anti-slavery amendment to the Constitution, which had failed to pass the House at the previous session of Congress, received more than the necessary two-thirds vote. The elections showed the strong drift of public feeling, and the Republicans construed the result as a virtual adoption of this amendment. When it was first suggested it aroused some opposition, but the majority of the people considered the amendment a political necessity to settle forever the question that had so long disturbed the country; 27 States voted in its favor, and in December, 1865, it was proclaimed a part of the Constitution. (See RECONSTRUCTION.)

Vice-Pres. Andrew Johnson had succeeded to the Presidency, and his administration was marked by a fierce conflict between him and the party that elected him. The result was that nearly all the Republicans opposed his policy and nearly all the Democrats approved it. So radical had this difference become that he vetoed nearly all the political bills passed by the Republican Congress from 1866 until the close of his administration, but such was the Republican preponderance in both Houses of Congress that they passed them over his vetoes by the necessary two-thirds vote. He vetoed the several freedmen's bureau bills, the civil rights bill, that for the admission of Nebraska and Colorado, the bill to permit colored suffrage in the District of Columbia, one of the reconstruction bills, and finally he made a direct issue with the powers of Congress by his veto of the civil tenure bill, March 7, 1867, and his subsequent attempt to oust Secretary Stanton from the cabinet.

The political differences between Pres. Johnson and the Republicans were not softened by their attempt to impeach him, which needed only one more vote to make the necessary two-thirds. It is indeed remarkable that the failure of their efforts did not weaken the Republicans as a party. They were so well united, and so strong in that unity, that the seven Republican Senators who voted to acquit the President passed at least temporarily from public life, some of the ablest, like Senators Trumbull and Fessenden, retiring permanently. Pres. Johnson pursued his policy, save where he was prevented by Congress, until the end, and he then retired to his native State, but was subsequently elected to the Senate.

The presidential campaign of 1868 resulted in the election of Gen. U. S. Grant by a majority of 134 electoral votes, Schuyler Colfax being elected Vice-President. At the commencement of his administration the colored people had not suffrage in some of the States, and to make it universal the Fifteenth Amendment was proposed and adopted by the State Legislatures. It did not receive a Democratic vote in either branch of Congress, and it was opposed by that party in the State Legislatures. On March 30, 1870, it was proclaimed a portion of the Constitution. Pres. Grant, in a special message announcing the ratification of the amendment, declared it a "measure of grander importance than any other one act of the kind from the foundation of our free government to the present day." Thus the proclamation of Mr. Lincoln, declaring what would be done in a subsequent order, found its continuation in this amendment, making its primal object and the resultant a part of the Constitution.

Reconstruction having been completed, a new question was brought before the Forty-first Congress by Pres. Grant, which was the annexation of San Domingo. The treaty of 1869, looking to that object, was rejected by the Senate, and a dispute about its negotiation was the origin of the rupture between Pres. Grant and Senator Sumner, who had been chairman of the Senate committee on foreign affairs.

With the exception of Louisiana, Florida, and South Carolina, the Southern State governments were under Democratic control, and Pres. Grant was called on by the Republicans for military aid to prevent the disfranchisement of the negroes, but he declined to interfere except to request the U. S. attorney-general to give them legal advice.

The Fifteenth Amendment did not produce the desired results in the South, because it was evaded or resisted, and the Republicans insisted that additional legislation was necessary to enforce its provisions. On Feb. 28, 1871, such an act was passed, and a supplementary bill became a law a year later. This legislation, enacted through Republican votes, extended the powers of the Federal supervisors and marshals and gave the Federal circuit courts exclusive jurisdiction of all cases tried under the provisions of the act and its supplements. It also empowered these courts to punish any State officer who should attempt to interfere with or try such cases as in contempt of the courts' jurisdiction.

The Forty-second Congress, organized in March, 1871, was not so strongly Republican as its predecessor. The most exciting question that came before that body was the Force bill, as it was called, intended to enforce the provisions of the Fourteenth Amendment. The act allowed suit in the Federal courts against any person who should deprive another of the rights of a citizen. It also provided that inability, neglect, or refusal by any State government to suppress such conspiracies, or their refusal to call upon the President for aid, should be deemed a denial by such State of the equal protection of the laws under the Fourteenth Amendment. It further declared such conspiracies "a rebellion against the government of the United States," and authorized the President, when in his judgment the public safety required it, to suspend the privilege of *habeas corpus* in any district, and suppress any such insurrection by the army and navy.

The first regular session of this Congress began Dec. 4, 1871. The Democrats consumed much of the time in efforts to pass bills to remove the political disabilities of former Southern rebels, and they were materially aided by the editorials of Horace Greeley in the *New York Tribune*, which had long contended for universal amnesty. At this session all such efforts were defeated by the Republicans, who invariably amended such propositions by adding Sumner's supplementary civil rights bill, which was intended to prevent any discrimination against colored persons by common carriers, hotels, or other chartered or licensed servants. The Amnesty bill, however, was passed, May 22, 1872, after an agreement to exclude from its provisions all who held the higher military and civic positions under the U. S. government previous to their joining the Confederacy—in all about 350 persons. Subsequently many special acts removing the disabilities of these excepted persons were passed.

During Pres. Grant's second term civil service reform became a leading topic. March 3, 1871, an act was passed empowering the President to commence said reform, and he appointed a commission with George W. Curtis as chairman. A section in the sundry civil appropriation bill gave the President authority to prescribe the rules, and a commission was appointed by him to draft them. The committee's plan was approved by the President, and they are substantially the same as those now in force. In its exe-

cution or effect it has not met the full expectation of its advocates.

The platform adopted in June, 1872, by the Republican convention at Philadelphia, declared that the constitutional amendments should be sustained; advocated civil service reform; opposed further grants of public lands; favored the abolition of the franking privilege, and declared the necessity for shaping legislation so as to give an ample field for capital and labor. It denounced repudiation of the public debts; advocated a speedy return to specie payments; approved the amnesty acts, and favored such measures as would tend to encourage and restore American commerce and ship-building.

A sensation in political circles was excited during the presidential campaign of 1872 by the exposure of the Credit Mobilier, and at the commencement of the next session of Congress, Speaker of the House James G. Blaine asked that a committee be appointed to investigate the charges made. These charges were that Schuyler Colfax, Vice-President, and several members of Congress had been bribed in 1867 and 1868 by Oakes Ames, a member from Massachusetts, to influence their official action for the benefit of the Union Pacific Railroad Company. The committee consisted of Poland, of Vermont; McCreary, of Iowa; Banks, of Massachusetts; Niblack, of Indiana; and Merriek, of Maryland. The accusations were made by Henry S. McComb, of Wilmington, Del., and some of the most prominent members, principally Republicans, were made the subjects of the investigation. As Congress was Republican at the time, the responsibility of the legislation rested with that party, and hence it was used against it in the presidential campaign. The proceedings are too voluminous to permit of even an abstract. The committee reported in each individual case, and in effect exonerated all from criminal action with the exception of Oakes Ames, who was at the head of the Credit Mobilier, and Representative James Brooks, of New York, who was a government director of the Pacific road. They recommended the expulsion of those two members, but the House modified it to the "absolute condemnation of the House."

During the same session the President's salary was increased to \$50,000 per annum, the act to abolish the franking privilege passed, and Congress voted to increase the pay of members of both houses to \$7500 per annum, including the current year. The latter act proved so unpopular that the old salary of \$5000 was restored, and many of the members either refused to take or returned the extra compensation to the treasury.

The closing session of the Forty-third Congress marked another era in politics—a conflict of State governments. In order to secure the political rights of the colored citizens in the Southern States, the Republicans in Louisiana increased the power of its returning boards, so that they had the power to reject a portion or the whole of a district where frauds were proven. Two boards had been appointed, each claiming to be legal and this was followed by two distinct State governments in Louisiana—the McEnery, or Democratic, and the Kellogg, or Republican. The latter instituted suit against the former, and the court issued an order authorizing the Kellogg party to take possession of the State-house and oust the Democratic Legislature. Both parties demanded the recognition of the national government. Congress refused to recognize directly either governor or Legislature, and a bill was introduced declaring the elections upon which those governments were based null and void; and providing for a new election, but was defeated. In order to ascertain the actual conditions of affairs Gen. Sheridan was sent to Louisiana and in January, 1875, he made his report which startled the country. It showed a condition of anarchy, violence and murder that demanded immediate action, and March 1, 1875, the House recog-

nized the Kellogg or Republican government by a strict party vote. Four days later the Senate by a party vote confirmed the action of the House.

In order to ascertain who were entitled to seats in the State Legislature a special committee of the House was appointed, which made an award in April, 1875, known as the "Wheeler Compromise." This award was accepted until the election in 1876, when both parties claimed the election of their candidates for governor and members of the Legislature. Gen. Grant requested committees of gentlemen of both parties to witness the count of the returning board, and committees of investigation were appointed by both Houses of Congress. A series of rebellious proceedings ensued, during which the State government was practically destroyed, the Packard or Republican branch complaining of outrages by the "White League," and the Nicholls or Democratic branch denying the charges, professing to accord rights to all classes and to obey instructions from Washington until Congress or the President should decide between them. No decision was made, as Pres. Grant believed that belonged to the duties of his successor in office.

The supplementary civil rights bill, known as the Sumner bill, was passed March, 1875, after the death of its author. The first conviction under the act was in 1876, before Judge Cadwalader, of Philadelphia, when a colored resident of Virginia brought suit for being refused hotel accommodations.

The platform adopted by the Republican convention at Cincinnati in June, 1876, was mainly a reiteration of its former principles. It declared the United States a nation, not a league; advocated a rigid enforcement of the constitutional amendments, and declared it the duty of the party to compel it. It advocated civil service reform, asserted that Congress had sovereign power over the Territories, and charged the Democratic party with being the same in character and spirit as when it sympathized with treason; with making its control of the House of Representatives the triumph and opportunity of the nation's recent foes; with reasserting and applauding in the national capital the sentiments of unrepentant rebellion; with sending Union soldiers to the rear, and promoting Confederate soldiers to the front; with deliberately proposing to repudiate the plighted faith of the government; with being equally false and imbecile upon the overshadowing financial questions; with thwarting the ends of justice by its partisan mismanagement and obstruction of investigation; with proving itself through the period of its ascendancy in the lower House of Congress utterly incompetent to administer the government.

The presidential election of 1876 was particularly animated, and the excitement was intensified by the result. Both parties claimed a victory, and up to a few days before the time to inaugurate the President the excitement continued. It was claimed that Hayes and Wheeler carried all of the Northern States except Connecticut, New York, New Jersey, and Indiana, and Tilden and Hendricks all the Southern States except South Carolina, Florida, and Louisiana. Those three States were claimed by the Democrats, but South Carolina was soon conceded to the Republicans. The electoral votes of Florida as stated by the returning board belonged to the Republicans by a majority of 926, and a second count, ordered by the State Supreme Court, reduced it to 206. In Louisiana the Packard Board refused to allow any Democrats to participate and certified a majority of 3931 for the Republican electors. McEnery, who claimed to be governor, repudiated the return of the board, and gave the Democratic electors the certificate on a majority of 7876. In Oregon it was claimed that one of the Republican electors was ineligible, being a Federal office-holder, and the Democratic governor gave one Democratic elector the certificate of election, but the three Republican electors were certified by the secretary of state.

During the ensuing controversy a sensation was made by the publication of "cipher dispatches," which Mr. Pelton, the nephew and private secretary of Mr. Tilden, had sent to Democratic "visiting statesmen" in the disputed sections. In 1878 the Potter investigating committee subsequently confirmed the "cipher dispatches," but Mr. Tilden denied any knowledge of them.

The second session of the Forty-fourth Congress met on Dec. 5, 1876, and while by that time all knew the dangers of the approaching electoral count, yet neither House would consent to the revision of the joint rule regulating the count. The Republicans claimed that the President of the Senate had the sole authority to open and announce the returns in the presence of the two Houses; the Democrats disputed this right, and claimed that the joint body could control the count under the law. But the impending danger was avoided by the patriotism of prominent members of Congress representing both political parties. These gentlemen, after several private conferences, substantially agreed upon a result several days before the introduction of the Electoral Commission Act. The leaders on the part of the Republicans in these conferences were Conkling, Edmunds, Frelinghuysen; on the part of the Democrats Bayard, Gordon, Randall, and Hewitt, the latter a member of the House and Chairman of the National Democratic Committee. That the Electoral Commission was a Democratic measure is shown by the character of the votes cast for and against it. In the Senate there were 21 Republicans for it and 16 against, while there were also 26 Democrats for it to only 1 (Eaton) against. In the House nearly the same proportion was maintained, the bill passing that body by 191 to 86.

The Electoral Commission was composed of five Senators, five members of the House of Representatives, and five Associate Justices of the Supreme Court. This extra-constitutional body met Feb. 1, and by uniform votes of 8 to 7 decided all objections to the electoral votes of Florida, Louisiana, South Carolina, and Oregon in favor of the Republicans, and while the two Houses disagreed on nearly all of these points, the electoral votes were, under the provisions of the law, given to Hayes and Wheeler, and the final result declared to be 185 electors for Hayes and Wheeler to 184 for Tilden and Hendricks.

Thus closed the most important crisis that ever attended an electoral count. Had not wisdom prevailed over partisan feelings it is probable that instead of a peaceable solution disorder, riot, and bloodshed would have resulted.

The opening acts of Pres. Hayes' administration tended to alienate the stalwart wing of his party. The withdrawal of the U. S. troops from the South and the overthrow of the Packard rule in Louisiana gave his policy a tone too conccessive to Southern demands. Later his efforts to prevent intimidation of negro votes in the South reunited his party. His veto of the judicial expense bill for the reason that it would prevent him from enforcing the election laws, and his special message asking that the appropriation bills be passed without the objectionable rider, brought him into full party favor. At the extra session of 1879, the main business of which was to pass the necessary appropriation bills, the Democrats continued their former tactics of adding riders to prevent U. S. supervision of the elections, but the President still interposed his vetoes. The firm attitude of the President and the party leaders on that question roused new spirit among the Republicans and did much toward giving them a majority in the House at the next election.

The most important political action taken at this session was the passage, for Congress was still Democratic, of a law to keep the peace at the polls. To this was added the Garfield proviso that it should not be construed to prevent the constitutional use of the

army to suppress domestic violence in a State—a proviso which in the view of the Republicans rid the bill of material partisan objections, and it was therefore passed and approved. The "political riders" were again added to the appropriation and deficiency bills, but were again vetoed and failed in this form to become laws. Upon these questions Pres. Hayes showed much firmness. During the session the Democratic opposition to the general election law was greatly tempered, the Supreme Court having made an important decision which upheld its constitutionality.

At the second session of the Forty-sixth Congress Pres. Hayes suggested the retirement of the legal tender notes and the maintenance of the policy for the accumulation of a sinking fund to pay the national debt. Sixteen days after Congress met gold sold at par in New York and specie payment became a fact.

The 3 per cent. funding bill was vetoed by Pres. Hayes for the reason that he and a majority of the Republicans in Congress did not believe the loan could be advantageously placed at that rate. Finally a bill fixing the rate at $3\frac{1}{2}$ per cent. became a law. Yet two years later the loan was successfully placed at 3 per cent. In reviewing the party for twenty years the convention at Chicago presented its claims for public support in the following declarations:

It suppressed a rebellion which had armed nearly a million of men to subvert the national authority. It reconstructed the union of the States with freedom, instead of slavery, as its corner-stone. It transformed four million of human beings from the likeness of things to the rank of citizens. It relieved Congress from the infamous work of hunting fugitive slaves, and charged it to see that slavery does not exist. It has raised the value of our paper currency from 38 per cent. to the par of gold. It has restored, upon a solid basis, payment in coin for all the national obligations, and has given us a currency absolutely good and equal in every part of our extended country. It has lifted the credit of the nation from the point where 6 per cent. bonds sold at 86 to that where 4 per cent. bonds are eagerly sought at a premium. Under its administration railways have increased from 31,000 miles in 1860 to more than 82,000 miles in 1879. Our foreign trade has increased from \$700,000,000 to \$1,150,000,000 in the same time, and our exports, which were \$20,000,000 less than our imports in 1860, were \$264,000,000 more than our imports in 1879.

Without resorting to loans, it has, since the war closed, defrayed the ordinary expenses of the government, besides the accruing interest on the public debt, and disbursed annually over \$30,000,000 for soldiers' pensions. It has paid \$888,000,000 of the public debt, and, by refunding the balance at lower rates, has reduced the annual interest charge from nearly \$151,000,000 to less than \$89,000,000.

The financial history of the Republican party is one of its proudest boasts. It took charge of the government in its extremity, without money or credit. It succeeded in negotiating enormous loans and in establishing a paper currency that finally assumed a gold value. It established the national banking system, which has received the commendation of all and which should be preserved as a firm foundation for the country's prosperity. The resumption of specie payments marked an important era, because it was the fulfillment of a pledge made by the party. The reduction of the public debt and the steadily reduced rate of interest show the wisdom of a policy which was adopted in the days of the nation's trial.

The administration of Pres. Hayes tended to awake a more independent sentiment in his party, and the divergence of the two wings became more apparent in the future. Impartial historians must give his administration the credit of softening party asperities and aiding very materially in the restoration of better feeling between the North and South. That his policy was the best for his party as well as his country was shown by the result of the following Presidential election.

The Republican nominating convention of 1880 was very exciting. Gen. Grant was urged by his special friends as a candidate. As the result showed, the

field was against what was called a "third term" and Gen. James A. Garfield was nominated on the thirty-sixth ballot. So intense was the feeling between the rival factions that it looked as if a divided party and defeat would follow, but the friends of Grant, as a rule, accepted the verdict of the convention, and former dissensions were put aside for present success. The Democrats made a strong nomination in the person of Gen. Winfield S. Hancock. The tariff became an important issue, the Democrats advocating "a tariff for revenue only." That plank was attacked by the Republicans, who favored a tariff for the protection of American labor. The Republicans were doubly successful, electing their President, and also a majority of the lower House, thus giving them entire control of the government.

The death of Pres. Garfield, and the induction of Chester A. Arthur to the presidential chair, caused, for the time, considerable unrest and division in the party. No person entered on presidential honors under more serious difficulties than Arthur, yet by his manly and conservative course he won the confidence of his party and the approbation of the whole people. Practically, there was no administration of Pres. Garfield, his official acts being almost entirely confined to official appointments, in which it was alleged he was unduly influenced by Mr. Blaine, his Secretary of State. His selection of William H. Robertson as collector of the port of New York estranged Senator Conkling and others, and when the nomination was confirmed by the Senate, May 17, 1881, Senators Conkling and Platt resigned their seats. This act caused a serious rupture in the party, and the effect was visible in the campaign of 1884, when Mr. Blaine lost New York, and through that loss was defeated for the presidency.

During the administration of Pres. Arthur the civil service act was passed, and the tariff reduction act of 1883; while the merchant marine act, which was passed, did much to relieve the business interests of the nation. Legislation against polygamy dated back to 1862, but it proved inoperative, and the Edmunds bill, which was signed by Pres. Arthur, was intended to effect what previous legislation had failed to do. Though the administration of Pres. Arthur had won for him public esteem, yet the popularity of James G. Blaine overshadowed that of all other competitors for the presidency in 1884. When the National Republican convention met at Chicago in June, he received the nomination on the fourth ballot. Gen. John A. Logan was nominated for Vice-President. The Democrats nominated Grover Cleveland and Thomas A. Hendricks. The issues were, in the main, a repetition of those since the war, although the tariff became a more prominent factor. The Chinese exclusion question also entered into that campaign. The Republican platform declared: "It is the first duty of a good government to protect the rights and promote the interests of its own people. The largest diversity of industry is most productive of general prosperity and of the comfort and independence of the people. We, therefore, demand that the imposition of duties on foreign imports shall be made, not for revenue only, but that in raising the requisite revenues for the government such duties shall be so levied as to afford security to our diversified industries and protection to the rights and wages of the laborer, to the end that active and intelligent labor, as well as capital, may have its just reward, and the laboring man his full share in the national prosperity." It pledged the party to correct admitted inequalities in the existing schedule of duties without injuring our industries. It advocated "retrenchment and reform," and in the contest that followed they became prominent issues. The Democrats demanded the abolition of the internal revenue as a war-tax.

The charges made by the Democrats, that a long term of service had corrupted the Republican party,

and that a change was needed, had some effect in deciding the contest. Another element in favor of the Democracy was the disaffection in New York through the opposition of ex-Senator Conkling, and the result of the election in that State showed its deciding power. That State decided the contest in favor of Cleveland by a plurality hardly exceeding 1000. Several causes may be given for the Republican defeat, but it is certain the Blaine-Conkling quarrel had sufficient effect to elect Cleveland. The vote in the electoral college stood 218 for Cleveland and 182 for Blaine. All the Southern States chose Democratic electors.

When Pres. Cleveland was inaugurated, March 4, 1885, the Republicans resigned the control of the government which they had held for twenty-four years. The history of the Republican party during Pres. Cleveland's administration mainly consists in its efforts to prevent the passage of measures antagonistic to its creed through the interposition of a Republican Senate.

The President stood pledged to enforce the civil service policy, and for a time he endeavored to keep it. But his party demanded the fruits of their victory, and the pressure became so great that he was compelled to depart from his own convictions. An outward show of observance was maintained, but the dismissal of Republican office-holders was the rule, and their retention the exception. In fact, the provisions of that law and the regulations under it have not been effectually enforced by either party. It had been predicted by politicians that its enforcement would weaken and tend to divide the party in power, and neither was willing to take the risk.

During the administration of Mr. Cleveland the House was Democratic, but the Senate remained Republican, and hence no legislation could be had without the consent of the representatives of both parties. On the important question of the tariff the "protective" character of the Senate was a bar to the House, which favored a sweeping reduction of duties. On this question the President was pronounced in favor of tariff revision. The bill, presented by Col. W. R. Morrison, known as the "horizontal bill," was opposed by the Republicans, and with the aid of some Democratic members, led by Mr. S. J. Randall, it failed to pass that body. The Republicans carried the issue into the campaign of 1886, but failed to secure a majority in the next Congress, although Col. Morrison and Mr. Hurd, two of the leaders in the tariff reform movement, were defeated.

Pres. Cleveland's message to the new Congress was confined to the same issue, recommending a revision of the tariff, and declaring the present tariff "vicious, illogical, and inequitable." It gave rise to an earnest and prolonged party contest in Congress. Mr. Roger Q. Mills, Chairman of the Ways and Means Committee, reported a bill, making radical changes in duties and placing certain articles, including lumber and wool, on the free list. The Republicans opposed it as a step towards free trade. All the Democrats in the House except a very few supported the bill as a party measure, and after a prolonged discussion it passed the House. When it came before the Senate, a committee of that body substituted another bill, protective in its character, which has not yet received final action. This contest, which resulted in a drawn battle in Congress, became the issue in the subsequent presidential campaign.

There was yet another prominent question which needs to be noted. Since the expiry of the reciprocity treaty with Canada, in 1881, there have been frequent serious disputes with regard to the rights of American fishermen in Canadian waters. To settle these troubles a treaty was negotiated at Washington in 1887, but the Senate refused to ratify it as prejudicial to American interests. The President then called for discretionary authority to retaliate on Canadians for injury inflicted on American vessels, but received no response.

The tariff message of Mr. Cleveland and the passage of the Mills bill by the Democratic House foreshadowed the issues on which the campaign of 1888 was to be fought. The Democratic convention at St. Louis, in June, indorsed that policy and renominated Mr. Cleveland. Subsequently the Republican convention met at Chicago and placed itself in pronounced opposition to the Mills bill, and in favor of continuing the present protective features of the tariff. It nominated Gen. Benjamin Harrison, of Indiana, and Levi P. Morton, of New York, for President and Vice-President. There were minor questions, but the tariff was the vital issue. The rallying cry of the Republicans was "Protection to home industry;" that of the Democrats was "Tariff reform."

The campaign was one of the most earnest ever known, especially in what were termed the doubtful States—New York, Indiana, New Jersey, and Connecticut. Of these New York was considered the pivotal State, and both parties made extraordinary efforts to secure its electoral vote. Towards the close of the campaign the injudicious conduct of Lord Sackville-West, the British Minister, in giving an inquirer advice how to vote, gave an international aspect to the contest, and quickly brought about the undiplomatic minister's dismissal.

The result of the election was a decided victory for the Republicans, who secured the votes of every Northern State except New Jersey. Gen. Harrison received 233 electoral votes and Pres. Cleveland received 168 electoral votes. The Republican party not only secured its President for the next four years, but the Congress chosen gives them a majority in the House. The Senate being also Republican, the party will on March 4, 1889, have entire control of the government. As the tariff was the issue, the result of the election gives assurance that the Republican policy of protection will be preserved as essential to the maintenance of national independence and prosperity.

(T. V. C.)

REPUDIATION. The repudiation by several of the States of the American Union of their public obligations derives interest from the anomalous position of the States. Possessing both the legal capacity and the commercial credit requisite for the purpose, they are enabled to contract debts and create obligations, and yet are not subject to the means of enforcing such engagements usually associated with the capacity of incurring obligations. If their indebtedness was merely to their own citizens the case would not differ from the ordinary one of such relations between a sovereign and subject, but the obligations issued by the States are usually largely held by the people of other States and of foreign countries. If these States were independent sovereigns they could be held to accountability upon their obligations by the powers by whose subjects such obligations might be held, but as integral parts of the nation they can only be reached by foreign powers through the national government and that practically precludes resort to either reprisals or war. As it regards obligations due by a State to the citizens of another State, Amendment XI. of the Constitution prohibiting individuals from bringing suits against States in the courts of the United States cuts off judicial remedies of that class. The absence of means of enforcement tends to give to the value of the obligations issued by the States a speculative rather than an intrinsic quality where the commercial integrity of the State has not been placed beyond question by habitual good faith towards its creditors. The circumstance just mentioned will be found to have an important bearing upon the history of repudiation in the United States.

The history of repudiation shows two distinct periods when the public obligations of several of the States have been violated. The first of these periods followed the speculative era that preceded 1836, when both public and private credit was stretched to an ex-

tent that produced with its collapse commercial disaster of a widespread character. While individual credits were at that time expanded through a variety of causes of a speculative character, the extension of public credit was mainly due to excesses in the construction of works of internal improvement projected in the interest of commercial development. The second of these periods was at the conclusion of the civil war, when the waste of war and interrupted industry had to be made good by an excessive use of State credits that speedily precipitated a crisis in public credits. The first of the periods to which reference has been made was essentially commercial in the character of its causes, while the second period was distinctly political.

In 1842 Pennsylvania failed to meet the interest on her funded debt, but finally succeeded in fulfilling her engagements. Unfortunately for her fame Rev. Sydney Smith, who was one of the sufferers for the time, thought proper to trumpet her failure to the world in an essay, which is still published without any notice of the State's subsequent amends. In 1842 Maryland also suspended payment upon a debt of \$12,000,000, contracted for internal improvements, but escaped from her situation without repudiation. Mississippi allowed obligations to be dishonored that were created in aid of a banking institution that failed, alleging as the cause of repudiation that the bonds had been negotiated for less than was permitted by law. In 1837 part of the proceeds of a loan made by Michigan was lost through the agent for its negotiation, and that State declined to recognize its obligation beyond the amount that had been realized to the State therefrom, giving rise to the serious charge that it was an attempt to hold the innocent purchasers of its bonds responsible for the conduct of the agent of the State. In 1843 Louisiana authorized debts due to a failing bank, that had operated under the patronage of the State, to be paid in depreciated State bonds at par, which, although not strictly an act of repudiation, approached it closely in principle.

The foregoing instances relate to the first of the periods already mentioned, and are to be regarded as part of a general commercial crisis in which both public and private credits suffered. (See **CRISIS, COMMERCIAL.**) During the second period the failure of public credits was on the part of most of the States that participated in the rebellion, including Virginia, North Carolina, South Carolina, Georgia, Florida, Alabama, Mississippi, Louisiana, and Arkansas. The general conditions out of which the repudiation of their public debts on the part of the States last named arose were the same substantially in all of those States. In these States the means and appliances for carrying on government and commerce were reduced almost to worthlessness. Public buildings were destroyed or out of repair, the railroads were worn out, their bridges largely gone, and were crippled for want of rolling stock. It was an urgent necessity that the industry of the States should be revived, and for that purpose that commercial intercourse should be re-established, and therefore that the existing railroads should be refitted and new roads constructed, and without aid from the public credit that restoration of production must wait an indefinite time. Until State governments were established that promised some permanency the work could not be entered upon. When these governments were put in operation they were conducted by persons unskilled in public finance or in public business of any kind, who did not represent what was left to the States of wealth and commercial credit, and were antagonized by the influence that up to that time had carried on the operations of those States and maintained their credit.

To accomplish what was actually needed by taxation in the then existing state of affairs was an impossibility, and the only recourse was to the credit of the States. It was inevitable that bonds of governments

thus circumstanced would have to be sold at ruinous rates not only for the reasons common to all the States of the Union, and for the special reasons already stated, but for the additional reason that the permanency of the then existing administration in those States was not anticipated, and should those governments come into the hands of those antagonizing them, the new rulers would not be apt to regard the honor of the States as involved in the faithful discharge of the obligations created during such transition period.

These causes operated more or less throughout all the States last named, but culminated in the State of South Carolina, where reckless legislation added to the embarrassment. Repudiation in Virginia was chiefly from the fact that West Virginia had been separated as a State without provision being made for her contribution to the payment of the debt of Virginia subsisting at the time of such separation. Virginia claimed that one-third of the debt should be paid by West Virginia as her just proportion. Virginia in 1871 funded two-thirds of her debt in bonds and issued certificates for the remaining one-third, redeemable when West Virginia should assume her part of the debt. It was provided in the funding act that coupons on the bonds should be receivable in payment of taxes. Subsequently it was enacted that only coin and currency should be received in payment of taxes, thus repudiating the obligation as to coupons forming part of the Funding Act. Again in 1880 the attempt was made in the readjustment of the debt of the State to repudiate a portion of the funded debt on the ground that it represented the capitalization of interest, which in the depressed condition of the State was claimed to be unjust.

The most general ground of repudiation throughout the repudiating States was the consequence of aid having been given to railroads with no proper return to the interests of the States. North Carolina repudiated upwards of \$12,000,000 of debt alleged to have been collusively obtained under the pretence of the building of railroads. Georgia and Florida based their action upon the decision of their courts against the validity of the bonds. Louisiana placed her action upon the ground of the unconstitutionality of certain issues. Arkansas acted upon the decision of her courts. Alabama and Mississippi repudiated large portions of their debts created in aid of railroads.

The case of South Carolina fully illustrates the general situation. The inauguration of the new State government in 1868 found an empty treasury and no available means of raising money by taxation. Finding that the bonds of the new State could not be sold except at ruinous rates, temporary loans were made upon bonds as collaterals in the expectation of funding at an early day. That expectation was never realized. The maturity of the loans finally resulted in the forfeiture of the bonds and their sale at a small per cent. upon their face value. A scheme for ascertaining the true indebtedness of the State and scaling it to 50 cents on the dollar was matured and carried out and a consolidated bond issued to replace the outstanding debt. In 1880 this scheme was revised and the original validity of the bonds that entered into the new issue was submitted to judicial inquiry and resulted in the invalidating of certain classes of bonds that had previously been validated and funded.

The cases of repudiation show three modes of accomplishing that end, namely, under the decisions of the courts of the indebted States, under the action of the Legislature, and by studiously omitting to make provision for their payment where such a provision was possible. That the decisions of the courts of a State should be accredited with authority to dissolve the obligations of such State is against the principle that no one can be regarded as a competent judge in his own case. The legislative authority of a State of the Union cannot impair its obligations, as that is dis-

tinctly forbidden by the Constitution of the United States. The act of repudiation by a State of the Union is therefore one of arbitrary force and not of law, for such an act cannot take proper effect under the Constitution of the United States, but it is to be regarded as simply taking advantage of its exemption from judicial compulsion. If a State fails to meet its engagements from absolute inability, its honor is untouched, and it may be entitled to sympathy. If, on the other hand, it denies the obligation when able to perform it and does not avail itself of the opportunity it possesses of submitting the question of its indebtedness to the judiciary of the United States, its justice must necessarily be brought under criticism.

The repeal of remedies existing for the enforcement of an obligation of a State at the time its debts are contracted is an unconstitutional act that can produce no proper legal effect, and those remedies still remain in vigor, although existing under the laws of the State, and this applies equally to the privileges attached to coupons. After a State has made a composition with its creditors, and especially where that composition is in the nature of a compromise, a question is presented to which little attention has been given. It has been assumed, as in the cases of Virginia and South Carolina already mentioned, that after a compromise and funding based thereon, it was competent that a State should reopen the question of the validity of the obligation that was the subject of such compromise. This cannot be done in the case of individual transactions, and no reason has yet been pointed out why it should be available to a State.

The preservation of the honor of the States of the Union seems to require that where they have reason to doubt the validity of their obligations and are satisfied that justice will admit of the solution of that doubt, they should take measures to have the question submitted to the judiciary of the United States, the only impartial tribunals in such cases, and when their inability to meet their obligations is confessed that they should readjust them upon consultation with their creditors, which can be done without loss of dignity and with the saving of their honor.

What effect the early financial history of the country may have had upon the state of opinion that rendered repudiation possible must remain the subject of conjecture. But the disposition made of the debt contracted by the issues of paper-money for the maintenance of the Revolution that gave independence to the States is clearly distinguishable from the idea of repudiation. The issues during that war constituted the currency of the country, and thus became distributed among the people, and, as they lost their purchasing value and finally ceased to perform any useful function to trade, were subject to vicissitudes tending to make their distribution still more general. When in 1790 Congress provided for funding the domestic debt at a great reduction upon its face value, the real question presented was whether that domestic debt should be at once absorbed by taxation, or that some portion of it should be left to future adjustment. The power of taxation in the hands of Congress was unlimited, and could have been extended to absorb the entire outstanding indebtedness, and that indebtedness was distributed as broadly as it would be practicable to distribute taxation for its absorption, and hence the reduction of the nominal value of the debt was equivalent to taxation for its absorption. The reason why any portion of that debt was funded must be considered to have been to postpone the adjustment of a certain portion of it to a future day, and to afford the holders of that debt the credit of the government to a limited extent to facilitate commercial operations. In view of the fact that the holders of the debt and the persons subject to taxation to pay it were practically the same, there cannot be found in the transaction the elements of repudiation.

The Confederate currency and bonds that were left

in existence at the destruction of the power upon whose credit they were issued stand in the position of representing no existing source of obligation, and the effect of the fourteenth amendment in forbidding the payment of that debt simply placed beyond the power of the government of the United States the ability to change that status into one representing the credit of the United States.

See "State Debts and Repudiation," by Robert P. Porter, *International Review*, Vol. 9; *Tenth Census U. S.*, Vol. 7. (A. J. W.)

REQUISITION denotes an official demand by the executive of one State upon the executive of another State for the person of an offender against the civil or the criminal law. The process is often known as interstate extradition. The U. S. Constitution provides that the governor of any State shall, upon the demand of any other governor, deliver to him any person charged with treason, felony, or other crime, who has fled from justice and is found in that State. The statute of 1793 requires such demand to be accompanied by proper affidavits of the indictment, or a warrant charging him with violation of law. The construction of this statute was, for many years, exceedingly loose, because of doubt concerning the definition of "other crime." Just before the civil war of 1861 the U. S. Supreme Court, in the case of *Kentucky vs. Dennison* (24 Howard, 66), declared that any act made a crime by the laws of the demanding State was extraditable. This decision was brought about by the refusals of Northern governors to surrender parties who were charged with assisting in the escape of slaves. At present there is no uniformity in State laws regulating the return of persons charged with crime to the State in which the crime was committed, and from which they have fled. In Pennsylvania, for a number of years, the executive has followed the rule that in cases of obtaining money by false pretence, or of embezzlement, where the executive was of the opinion that the process was to be used chiefly for the purpose of collecting a private debt, a requisition would be declined. Yet requisitions continually come to the executive of that State asking for the surrender of persons charged with offences for which he would not grant requisitions. Even if criminals do not actually escape capture, States are often put to great expense and trouble for the want of uniformity in the laws; and the enforcement of justice is greatly retarded, if not altogether defeated. The Legislature of New York passed an act in 1886 which provides that no fugitive shall be taken out of the State, either with or without his consent, without a requisition being first obtained, thus preventing kidnapping; and the self-surrender of persons by reason of intimidation.

In 1887 representatives of nearly all the States of the Union met in the city of New York to promote greater uniformity in methods of interstate extradition. A committee was appointed to draft a bill embodying the conclusions of the conference, and such other provisions as upon careful examination they might deem necessary to make uniform the law and modes of procedure for the extradition of fugitives from justice. The committee met in New York city, in September, 1887, and agreed upon a bill to be submitted to Congress. In substance the bill provided that a person arrested in a State other than that in which the alleged crime was committed may be bailed during extradition proceedings, but must present himself within 20 or 30 days for extradition. At the end of that time he shall be discharged if the agent of the State in which the crime was committed be not ready to receive him. Should the accused be not able to furnish bail he shall be discharged after 30 days' imprisonment if the agent is not ready. The agent must have written authority from the governor of the State surrendering the accused. Any official using violence, threats, or undue influence to compel an

alleged fugitive to leave the State to which he had removed himself shall be guilty of a felony, punishable with from 5 to 10 years' imprisonment at hard labor. The prisoner shall not be arrested upon civil or criminal process in the demanding State until a reasonable time after the proceedings for which extradition was made, so that he may have an opportunity to return to the State in which he was taken. Should a demanding governor become satisfied that the extradition proceedings have been invoked for private purposes, he may revoke the same and discharge the fugitive. The bill awaits the action of Congress.

(F. G. M.)

RESURRECTION. This term denotes the revival of the human body from the grave and its resumption of existence in a future state. It differs from immortality, which denotes merely the continued life of the soul after it has parted from its earthly tenement, and also from metempsychosis, that is, the passing of the soul of a man after death into the body of a lower animal or through a succession of such animals. It is presented in the Scriptures, not as a philosophical speculation, or a beautiful, inspiring vision, but as a constituent and necessary element in the future life of the people of God. This article will seek to give simply an outline of the way in which the doctrine has been and is considered and treated in the Christian Church; for the conception is one that has not been found with any clearness or positiveness in any of the ethnic faiths.

Scattered intimations of the truth are given in the Old Testament, as in the translation of Enoch and Elijah, in certain expressions of the Psalms (xvi. 9, lxxiii. 24-26), in the striking imagery of Isaiah (xxvi. 19), and in Ezekiel's vision (xxxvii. 1-13) of the re-animation of the dry bones. In Daniel, the last of the greater prophets, it is expressly said that "many that sleep in the dust of the earth shall awake." In the later Judaism the doctrine became clearly defined, and was held by the great body of the people, as appears from Martha's answer to Christ's promise that her brother should rise again, "I know that he shall rise again in the resurrection at the last day." The only exception to this view was the sect of the Sadducees, which, however, was neither large nor influential. In the New Testament the point is everywhere assumed or expressly asserted, our Lord calling himself "the resurrection and the life," and affirming that the rising again of the dead shall be universal, including the evil and the good. His apostles reaffirm this teaching, dwelling however with special emphasis upon the resurrection of believers, which they connect with that of Christ as its evidence and earnest and pattern. The apostle Paul, in what is the classic passage of the New Testament upon the subject, gives some animating particulars concerning the future body of the righteous, but concerning that of the ungodly neither he nor any other inspired writer says anything beyond the mere fact that they also shall rise. In the Epistle to the Hebrews the resurrection is spoken of as one of the elementary truths of Christianity, which it is, being bound up with the future life and the whole purpose of God respecting his redeemed people. Hence its general and constant reception among Christians. It is a distinct article in the Apostles' Creed, the earliest symbol of faith, and is found in every other confession of the historic church; and at this day all divisions of Christendom, however differing on other points, are at one as to the final victory over the grave at the last day.

But while there is a general agreement as to the article, "the resurrection of the dead," there is much difference as to what it implies. There are some who make it altogether figurative, as if it meant only a spiritual resurrection. Others have supposed it to mean the literal reassembling of all the particles that have at any one time been in the physical frame. Others again say that it is the continued preservation

of a small portion of these particles, which by divine power is reconstructed into a body adapted to the soul's new condition. A fourth view limits this preservation to what is called a "vital germ," which, small as it may be, suffices as a link of connection between the old body and the new. A fifth opinion is that at or soon after the moment of death there is disengaged from the mortal remains a spiritual body which, in union with the soul, passes into another state of existence. A sixth view is that the vital principle which now appropriates earthly materials will still continue to exist and will at the resurrection perform the same office as before, only upon materials of a higher class. But all these statements are merely theoretical, for the Scripture, while it often sets forth the fact of the resurrection, says nothing of the manner in which it is brought about. The only prolonged discussion, that contained in First Corinthians (chap. xv.), states results, not processes. It clearly teaches that there is not the substitution of a new body, but the transformation of the old, and the effects of this change are set forth with grace and force. "Flesh and blood cannot inherit the kingdom of God;" that is, our bodies as now organized are not suited to the new and exalted state of being. They will therefore undergo the needed change in several particulars. The body now is subject to decay and indeed is in a state of corruption, but hereafter it is to be incapable of decay or dissolution. It is now a body of humiliation (Phil. iii. 21), bearing the scars of sin and shame, but when raised it is to be fashioned anew after the pattern of Christ's glorified body as he sits at God's right hand. It is now weak and subject to many trying limitations, but in the next world it will be instinct with undecaying energy and endowed with faculties far beyond what we now conceive. It is now a "natural body," that is, one adapted to the present condition of the soul and the constitution of this world; but it is to become "a spiritual body," that is, one adapted to the glorified condition of the soul and to the constitution of the new heavens and new earth. The apostle concludes his discussion in a lofty strain of eloquence showing that in his view the resurrection of the righteous is not only of great significance in and for itself, but is also the final conquest of the redeemed over every form of evil. Still there is no answer to the many questions that arise as to the way in which this result is brought about. There always has been, and doubtless always will be, much speculation on the interesting subject, but it is foredoomed to failure. We neither know nor can know how the dead are raised up, any more than we know how the grass grows or how God exists. All that the Scripture is responsible for is the fact, and it is a very important one. Man here consists of soul and body, and hereafter he will consist of the same. The complete personality is to stand before the judgment-seat and to receive its unending retributions. To make this possible it is ordained that the dead shall be raised. The whole historical person that lived on earth is to live hereafter and to receive the just reward of his works. It is this fact which takes the tenet out of the domain of mere sentiment and gives it a place among the most important factors of human thought. It does away at once and forever with the undue disparagement of the body which has appeared at times in the Christian church, arising from the old heathen notion that matter is essentially vile, and hence that the body is the source of all sin and misery to the soul, or from certain ascetic principles which, regarding the body as an incubus or a burden, aimed not at controlling but at extirpating all natural appetites and passions. So far from this being the case, the body is an integral and essential constituent of man's nature, and as such is to be neither abused nor punished, but fostered and cared for, since even in a far higher state of being it will still hold its place in the human economy and be a fit temple of the Holy Ghost.

The objections which are made to this doctrine are

founded upon a misconception of its nature and grounds. It has been said that it is opposed to all the conclusions of physical science: for, so far as the most exact observation shows, the human body is when dead subject to the same laws of decomposition and dispersion as those which prevail over the remains of the irrational animals. In no case has there ever been seen the least sign of a tendency to resurrection any more than in the abandoned carcasses of the brute creation. To all appearance the bodies of rational and irrational beings pass away alike, and are equally and irrevocably mingled with their kindred dust. Science therefore, it is claimed, pronounces decidedly against the possibility of a resurrection. But this conclusion is much wider than the premises. Chemistry and physics can tell us what is, but not what may be. The doctrine is not a deduction from observation and experiment, nor does any one seek to establish it by the evidence of natural law. It rests wholly upon divine revelation. Whether it is within the power of God to reconstruct the decomposed body is not a matter of doubt to any intelligent theist. The same hand that made the human frame can surely restore it from any degree of decay and decomposition. The question is not one of physical inquiry or scientific analysis, but simply of revelation. Has God said that this extraordinary event shall occur? If he has, the case is closed, for of the future we certainly know only what he has declared; and that the Scripture declares that this mortal shall put on immortality is beyond doubt. The statement lies on the face of the record, and is confirmed by the consentient faith of the church from the beginning. It is identified with the integrity of the gospel and the hope of every believer, living or dying.

A much more serious difficulty turns upon the question of identity. The whole value of the doctrine as it is stated in the creeds, and as it is held in consciousness, rests upon the view that the same body that is committed to the grave rises again, so that there is a real continuity of existence. What is said is not that God will create a new body, but that he will restore the old one. But it is asked how that can be when the buried physical frame is not simply reduced to dust, but resolved into elementary principles which become so thoroughly mixed and confounded with others of the same or of a different kind, that it is quite inconceivable that they should be traced out, and separated and recombined into their old connections. To this it might be said in answer that all things are possible with God, not even this stretch of power being beyond the resources of the Infinite Mind; but a better answer is that the objection presupposes what is not the case, viz., that the doctrine implies the raising again of the same elementary particles as composed the former body. The slightest reflection shows that this is not the case. These elementary particles never have been the same during the existence of the body on the earth, but have always been in an unceasing flux. Every few years or, as some say, every year the old materials pass away and new ones take their place; indeed, so continuous is the process that no man's body one day is precisely identical with what it was the day before, or what it will be the day after. Still to all intents and purposes it is the same body, occupies the same place, and performs the same functions: the man himself feels it to be such and would be greatly surprised were any one to tell him to the contrary. Hence it is clear that the resurrection body by no means requires to be composed of the identical substance that was committed to the grave.

The same consideration disposes of the difficulty raised by some when they ask if all the defects and infirmities of the corporal frame are to be reproduced in the future life. Is the infant to be raised up as an infant; the aged man as wrinkled and tottering; the lame as still a cripple; the leper covered with sores; the deaf, or dumb, or blind, as still laboring under

these misfortunes? The question hardly deserves an answer. Experience in the present world makes it plain that all such things are mere accidents, in no case and in no degree affecting the substance of things. The human body may undergo the most serious changes either for the better or the worse without at all affecting the conscious identity of the person. And it is fair to conclude that the same fact will hold good in the future life. The body, the apostle says, is to be raised in glory, which must at least mean that whatever in the way of defect or deformity would tend to unfit it for the activities and enjoyments of the heavenly state will be left behind, and all its organs and members be exalted to the highest pitch of excellence. Yet the difference, great as it may be between the old and the new, the earthly and the heavenly, the natural and the spiritual, will not at all affect the fact that it is the same body and belongs to the same person, any more than the difference between the small acorn that is planted and the stately and widespreading oak into which it grows interferes with the identity of their existence.

The embarrassment which many feel on this point arises from confusion of thought. They assume that the same law holds in regard to living organized beings and to inanimate substances. The identity of a stone lies in the identity of the particles of which it is composed. Take away any considerable portion of those particles or substitute others in their place, and it is no longer the same stone in any proper sense. But this is not the case with a plant or a human body, as all observation shows. In them we neither seek nor find any numerical sameness of the constituent atoms. These may differ from time to time in number, in condition, in quality, but they agree in their mutual relations, and in their association with one central, formative principle. This constitutes the special individuality of any particular plant or animal. And no one has any doubt of its identity in any or all stages of its existence. The same consideration applies to the resurrection body. Of whatever sort its constituent particles may be, or whencesoever they are derived, they stand in intimate vital union with the same formative principle, and so constitute one and the same individual being. The new body thus constructed is a fac-simile of the old one. It has the same characteristic expression. It is recognized by its possessor, and it is capable of recognition by all who knew him on the earth. Every man has his personal character—peculiarities of mind and heart which distinguish him from every other man, and this character is more or less clearly revealed by the form, the features, the air, the carriage of his body. There seems no reason to doubt that this will continue in the life to come, and that the revelation of the outward by the inward will be more exact and informing in heaven than it has been or can be here on earth. It was a sight of surpassing splendor that John saw in Patmos when the glorified Saviour stood before him with a face shining like the sun, eyes like a flame of fire, and feet like unto brass burning in a furnace, but still the apostle recognized the form as that of the Son of man. Although thus transfigured, it was still the same Jesus who was born at Bethlehem and died on Calvary. Herein the Master is the pattern of the disciple, for it is written that he "shall fashion anew the body of our humiliation that it may be conformed to the body of his glory." "As we have borne the image of the earthy we shall also bear the image of the heavenly."

The sum of what has been said may be stated in the following particulars :

1. The resurrection of the dead is a doctrine of revelation, and as such is neither affirmed nor denied by physical science. 2. Properly understood it involves nothing that is unreasonable or fanciful. 3. It is of very great moment in connection with the remedial system. 4. It means that redemption is not merely pardon, or deliverance from spiritual suffering, but

takes in the whole man, the body as well as the soul. 5. It is a constituent part of the great consummation when Christ comes to wind up the present system of things. 6. It meets a deep-seated longing of our nature. 7. It does justice to the dual constitution of man as composed of both material and immaterial elements. 8. It lays a basis for the future recognition of those whom we have known and loved in the present life. 9. To the bereaved it dissipates the dark shadows that hang over the grave. 10. It makes more lively and satisfying the conceptions we are authorized to cherish concerning the eternal blessedness of the redeemed.

The literature of the subject will be found in the Appendix to W. R. Alger's *Doctrine of the Future Life*, by the late Ezra Abbot. This bibliography, which has also been issued separately, is wonderfully copious and accurate, and leaves nothing to desire. (T. W. C.)

RESURRECTION PLANT. This name is given to certain plants possessed of peculiar habits which seem equivalent to a return from death to life. The principal of these is *Anastatica Hierochuntina*, called fancifully the Rose of Jericho, a plant of the mustard family which is found in Northern Africa, Syria, and Arabia. It is an annual, with very short stems and branches radiating from its summit to the length of several inches. In the period of dry weather which follows the flowering season the branches curl inward, till the plant looks like a curious ball of wicker work, at the top of the short stem. The root now decays, and the plant, torn up by the winds, is carried long distances over the level country. If it reaches water, or is lodged where rains can fall upon it, the moistured branches unfold and expand, and the pods open and disperse their seeds, the whole arrangement being one of nature's methods for the wide dispersion of seeds. The phenomena of curling and uncurling may be indefinitely repeated by successively drying and moisturing the plant : hence its common name.

Resurrection Plant, Open.

Closed.

Another plant of similar property is the *Selaginella lepidophylla*, a cryptogamous plant allied to the Lycopodiums, or club mosses. It is found in the arid districts of Southern California and New Mexico, and consists of a tuft of flattened branching stems, of fern-like aspect, which are found clinging to rock crevices, the stems curled into a nest-like ball. In the rainy season they uncurl, and the plants appear as beautiful rosettes of brilliant green. When quite dead they will still expand if moistened, and they are frequently sold under the name of resurrection plant. (C. M.)

RETZSCH, MORITZ (1779–1857), a German artist, was born at Dresden, Dec. 9, 1779. He studied art at the academy there, and devoted himself to painting mythological subjects and illustrating the works of the great poets. His outline etchings of Goethe appeared first in 1812 and an enlarged edition in 1834. In 1816 he became a member of the Dresden Academy, and in 1824 he was made professor there. In 1822 he commenced a series of illustrations of Schiller's

works, in 1827 of Shakespeare, and later of Bürger's Ballads and other works. His illustrations attained popularity in England and France as well as in Germany. He died at Dresden, June 11, 1857.

REULEAUX, FRANZ, a German technologist, was born at Eschweiler near Aix-la-Chapelle, Sept. 30, 1829. At the Polytechnic School of Carlsruhe he studied machine construction, but he also studied philosophy at Berlin and Bonn. After some service as a practical engineer he became in 1856 professor of machine construction at Zurich. In 1864 he was called to a similar position at Berlin. In 1867 he served on the jury of award at the Paris Exposition, in 1873 at Vienna, and in 1876 at Philadelphia. His *Letters from Philadelphia* (1877) created a sensation in Germany by their severe criticism of the German manufactures displayed, and eventually brought about great improvement in German workmanship. Reuleaux attended the exhibitions in Sydney and Melbourne in 1879 and 1881. He has also been connected with the Imperial Patent Office. He has published *Konstrukteur* (1871), *Theoretische Kinematik* (1875), and *Quer durch Indien* (1884).

REUSS, EDOUARD GUILAUME EUGENE, a French theologian, was born at Strasburg, July 18, 1804. He was educated in his native city and studied theology at Göttingen and Halle, and Oriental languages at Paris. He began to teach Biblical and Oriental literature at Strasburg in 1829, and became professor there in 1836. He published *Histoire de la Théologie chrétienne au siècle apostolique* (2 vols., 1852); *Histoire du Canon des Saintes Écritures dans l'Église chrétienne* (1863); *Geschichte der heiligen Schriften des Alten Testaments* (1881); *Les Épîtres Pauliniennes* (1883). He also projected a new French translation of the Bible, with introduction and notes, which was completed in 17 volumes (1874-79). Reuss was instrumental in introducing German criticism and methods of investigation among French theologians. He has taken part in editing a new edition of Calvin's *Works*.

REUTER, PAUL JULES, BARON, telegraphist, was born at Cassel, July 21, 1821. While employed as a banker's clerk at Göttingen he became interested in the discoveries in electro-magnetism. The European revolutions of 1848 suggested to him the importance of rapid communication of news. In 1849 he attempted to start in Paris a system using lithographic copies of condensations of daily news. But when the Prussian government allowed the public use of the telegraph from Berlin to Aix-la-Chapelle, he removed to the latter and sent the news thence to Brussels by means of carrier pigeons. As fast as telegraphic lines were extended, he took advantage of them, and supplied the deficiencies by couriers, steamboats, and other means, even building telegraph lines himself when permission could be obtained. In 1851 he removed his chief agency to London, whence he had communication with all parts of the world. He was naturalized as a British subject and formed a partnership with Baron Erlanger. He established close relations with the newspapers, and the *Times* called in his aid during the war in Italy in 1859. His title of baron was conferred by the duke of Saxe-Coburg-Gotha in 1871.

REVELATION, BOOK OF. This See Vol. XX. book of the New Testament is closely related in thought, and to some extent in form, with the discourse about "the last things," recorded in Matt. xxiv.; Mark xiii.; Luke xxi. While it bears some resemblance to the Jewish "Apocalyptic Literature," it is as markedly distinct from writings of that class as are the Canonical Gospels from the Apocryphal Gospels. The difficulty of interpreting the book arises in part from its unique character, and from the avowedly prophetic nature of its contents. Dr. Harnack, in the article in the *ENCYCLOPÆDIA BRITANNICA*, speaks of it as "the most intelligible book in the New Testa-

ment," but the intelligibility he claims for it is dearly purchased. It will be impossible to discuss his views in detail, but the critical method of investigation he adopts has no right to call itself "historical," since it gives little or no weight to historical testimony, and deals in the most arbitrary fashion with the internal evidence furnished by the Apocalypse itself. As a result the greatest uncertainty is thrown about the question of authorship, the one question that is most readily answered; while the really difficult questions of interpretation are regarded as easy of explanation.

1. *The Author of the Apocalypse.*—External evidence points to the apostle John as the author; the witnesses on the other side usually show some prejudice against the book itself, and hence seek to deny its apostolic authority. That some other John was the author seems impossible, and the supposition "that the name of John was interpolated in the last revision (after the death of the apostle John)" is without any support, external or internal. This view scarcely differs from that which deems the book a forgery.

The objections urged by Harnack against the view that the apostle John was the author are not convincing. (1). The opinion of the so-called "Alogi" cannot outweigh the positive testimony supporting the genuineness of the Apocalypse. (2). The internal reasons are invalid; the apostle in describing his visions need not designate himself as a personal disciple; his language about the twelve apostles agrees with the character of the Apocalypse; his descriptions of Christ need occasion no difficulty. The psychological unintelligibility, alleged in the article in the *BRITANNICA*, is based upon prejudgment in regard to the theological position of the assumed author. The main difficulty is based upon the obvious difference of style between the Apocalypse and the Fourth Gospel. The Tübingen school accept the former as the work of the apostle John, in order to deny the genuineness of the latter. Some critics who regard the apostle as the author of both works, accept an early date for the Apocalypse, in order to account for these differences by the long interval. But this is not necessary; the two books are totally distinct in character; one a simple historical narrative, the other a description of visions, alleged by the author to be supernatural. This of itself would account for the difference in style. The variations in language have been overestimated; the doctrinal positions are not diverse; there are, indeed, positive evidences of a common authorship, in plan, and thought, and phrase. The difficulty of forming a consistent theory other than the so-called "traditional" one will appear from the variety of opinions proposed by recent critics; most of them purely conjectural, or at best based upon assumptions respecting the origin of the New Testament books. In the case of both books the burden of proof rests with the opponents of the "traditional" view. If an early date be assigned to the Apocalypse the name of John could scarcely be interpolated, and apostolic authority so universally admitted. A later date to the Gospel calls for an author worthy of the book, and the second century does not reveal any one who could have written that Gospel. If both were written in the first century, we may most consistently accept the apostle John as the author of both.

2. *The Date of Writing.*—Recent scholarship accepts a date shortly before A. D. 70. The grounds for the opinion are (1) that the book implies that the destruction of Jerusalem had not yet occurred; (2) that the Antichrist is Nero, the number of the beast (666, chap. xiii. 18) indicating "Emperor Neron"; (3) that the earlier date allows sufficient time for the change of style noticeable in the Apocalypse and the Fourth Gospel. The last argument is of course rejected by those who deny the genuineness of either of these books. Yet the external evidence supporting the later date (under Domitian, between

A. D. 93-96) is so strong that Harnack is compelled to resort to the theory of a later revision. But these arguments are open to objections: (1) The reference to Jerusalem must be explained in a literal sense, if it points to the city as still standing, yet the rest of the book can scarcely be interpreted in this way. Moreover, it is difficult to account for the absence of specific reference to the impending destruction of that city in a professedly prophetic book, if that book were written before the catastrophe, which Christ himself had plainly predicted. (2) The interpretation of xiii. 13, as referring to Nero, as well as the assumed reference to the reigning emperor in xvii. 7-12, cannot be deemed conclusive. It is not agreed who this emperor was; it is implied that the ideal date of the vision and the actual date of the book coincide, an utterly unwarranted assumption. Furthermore, the notion that the Antichrist of the Apocalypse is Nero come to life is often linked with this argument. That notion belittles the book and virtually makes the author a superstitious dreamer, a retailer of heathen fables. Yet many interpreters who reject all this hold that the early date is to be preferred as affording a better theory of interpretation, namely, one that finds the visions, in part at least, fulfilled in the first century. (3) The difference in style between the Apocalypse and the Fourth Gospel can be explained by the difference of the character of the works. The style of the Apocalypse is not that of one unfamiliar with Greek, but rather of one choosing intelligently the peculiarities of language that he employs. As the current of opinion now sets strongly in favor of the earlier date, it is well to note some positive reasons in favor of the "traditional" view. The letters to the seven churches of Asia indicate an intimate relation with those churches. These churches were mainly founded by Paul, and up to A. D. 63 there is no hint of the presence of the apostle John in that region. He seems to have gone there to escape the impending calamities in Judea. Some time would be required for the establishment of the relations indicated by the epistles in the Apocalypse. Moreover, these seven churches are taken as representing the whole church; a fact that seems inconsistent with the earlier date, before Jerusalem had fallen. Other considerations from internal grounds tend to confirm the well-attested date in the reign of Domitian.

3. *The Canonicity of the Apocalypse.*—The book seems to have been well-nigh universally accepted in the second century. The extravagances of some interpreters led to some doubts respecting its authority, which find expression in Eusebius and other writers. But Eusebius himself did not reject it. In the fourth century these doubts were dispelled, and since that time the book has been recognized well-nigh universally, though for a long time ignored in the Eastern church.

4. *Design and Contents of the Apocalypse.*—We may dismiss at once the notion that the book is a Jewish-Christian polemic against Paul and the whole Tübingen theory respecting it. Accepting the apostle John as the author and the record of the vision as a transcript of what he actually saw "in the Spirit," we must reject all theories of its design that cast doubt upon the prophetic character it claims for itself. The article in the *BRITANNICA* assumes, as do many critics of this generation, that the author's view was "entirely bounded by his own subjectivity and circumstances" (Alford). Hence the arguments in regard to authorship and interpretation are based upon the assumed standpoint of the author, his personal hopes and fervid fancies. Its value is made to consist in the clear view it presents of the aspirations and anticipations of this unknown author, who though a Jew had a firm faith in Christ, and yet had not attained to the full freedom of the gospel. Those who accept the gospel narratives as historical will find no difficulty in believing that such visions could be made

the channel of prophetic revelation to the last surviving apostle. Those who believe in the Christ of the Gospels will find it difficult to believe that this apostle invented this Apocalyptic scenery to give expression to his own personal hopes. Regarding it as a prophecy, which it claims to be (i. 1, 2), we need not, however, regard it as a prediction of chronological details. It certainly sets forth in outline a conflict between Christ (and his people) and the enemy, but the constant recurrence of the number seven (the number of perfection) seems to indicate that this conflict extends over the entire period of the church militant, whether the various details are given in chronological sequence or not. (See further under 5.) It is therefore a book for all ages, but especially full of hope for the persecuted church.

The plan of the Apocalypse is not distinctly marked throughout, but some of the divisions are very obvious. The number seven is conspicuous; hence the effort has been made to find seven distinct visions, each seven-fold in its details. But it is difficult to verify this theory of the arrangement. After a prologue (i. 1-8) we find seven epistles (i. 9-iii. 22); then comes the prophetic portion, as it is termed. Here a series of seven visions may be accepted, but there are episodes, and the events signified in one vision seem to be symbolized in a succeeding one. (1) The prelude or opening vision in heaven, iv.-v. (2) The seven seals, vi.-viii. 1. (3) The seven trumpets of judgment, viii. 2-xi. 19. (4) The seven mystic figures (the woman, her enemies, the Lamb, the three angels of judgment), xii. 1-xiv. 20. (5) The seven bowls of wrath, xv. 1-xvi. 20. (6) The seven-fold judgment upon Babylon, xvii. 1-xix. 20. (7) The final triumph, xix. 11-xxii. 5. An epilogue follows in xxii. 6-21.

Some take the epistolary portion as the first in the series of seven visions, and join (1) and (2), while other variations are advocated by other interpreters. It should be noted that the numbers four, three, and twelve are also used with symbolical significance. The many correspondences between the sets of seven symbols have suggested the view that the visions, some of them at least, represent the same periods, are synchronous, not successive, in their significance; each series being complete in itself, and probably representing some aspect of the conflict, from the beginning to the close. There is, moreover, in each principal group of symbols a climax represented. All the imagery is presented with more or less of the characteristics of Hebrew poetry, parallelism, and contrast, involving occasionally double representations of the same theory, the ideal and the actual aspect of the object being described in close connection. The episodes which occur are quite obvious, and the writer frequently uses "prolepsis," anticipating "in earlier sections, by mere allusion, what he is only to explain at a later point of his revelation" (Milligan).

5. *The Interpretation of the Apocalypse.*—Three leading systems of interpretation have been advocated; a fourth is now becoming prominent. (1) The *preterist* system, or theory, applies the revelation as a whole to the early Christian ages, either to the destruction of Jerusalem or to the overthrow of heathen Rome, or to both. This system has had many advocates in the past, who accepted the Apocalypse as a real prophecy. At present it is the favorite system in Germany, but is very often joined with the "Nero fable." The earlier date of composition is usually maintained by the advocates of this system, in order to antedate the events to which the visions are assumed to refer. Undoubtedly there is an element of truth in this system, since the book itself claims to reveal "the things which must shortly come to pass" (i. 1). But to limit the meaning to events in the early centuries seems unwarrantable. For (a) the visions must obviously cover events that can become actual only at the end of time; (b) the interpretation of the special

points by this system has not been satisfactory; (c) this limited view detracts from the permanent value of the book, and often leads to a denial of its prophetic character. The strongest argument from a single detail is that based upon the number 666. It is held that this must signify the name "Emperor Neron." But this is by no means certain. The interpretation is a recent one; a dozen others have been advocated with as great plausibility. (See Schaff, *History of the Christian Church*, Vol. I., pp. 841-852, for a full statement of the various explanations.) Against this explanation of the number many objections are properly urged, drawn from the other details with which the number is connected, most of these being inapplicable to Nero. (2) The *futurist* system explains the book as referring for the most part to events still future, closely connected with the Second Advent. The element of truth here is obvious: the closing visions, probably the close of each vision, point to the end of this dispensation; but this does not warrant the limited view peculiar to this system. (a) A number of expressions in the book itself affirm that some of the events symbolized were near in time. (b) This system leads to an excessive literalism in interpreting the numbers, etc. (c) By removing the prophecies entirely out of history, it encourages fantastic chiliasmic views. This school of interpreters is not numerous at present, though it still has able representatives. (3) The *historical* (or *continuous*) system extends the fulfilment of the prophecy from the First to the Second Advent, accepting a chronological sequence in the visions, either as one series, or as repeated and synchronous representations of different phases of the same great conflict. This system was advocated in the twelfth century, and since the Reformation has been the view most commonly held by Protestant scholars, before the "præterist" reaction in Germany. The Reformers were wont to identify "Babylon" with Papal Rome, and thus a dogmatic support was given to the system. That it contains more elements of truth than either of the others is quite probable. The conflict portrayed in the Apocalypse does cover the whole Christian dispensation; its leading features seem to stand out prominently, and final victory is certainly assured. But this method of interpretation, when it is applied to chronological details, involves serious difficulties, and has been used in a way alike absurd and fanatical. Nor has there been any general agreement as to the detailed interpretation. It is still disputed, for example, whether the several sets of symbols represent successive or synchronous series of events; whether the millennium has already begun or is still future; when the millennium began, on the theory that it is not still future. In fact each generation of historical interpreters is forced to reconstruct the theory of fulfilled prophecy. Contemporary events are magnified, and the attempt made to find allusions to them in the Apocalypse—the progress of history proving the special interpretation to be false. This is the story of the centuries during which this system has been the dominant one. That it has fostered fanaticism is obvious enough. We may therefore expect to find serious objections to it, in so far as it attempts to construct a chronological sequence of fulfilment answering to the visions in detail. These objections are: (a) The character of the book and its symbolical language point to an ideal rather than a historical arrangement. (b) The purpose of such a book can scarcely be to enable us to forecast the future with chronological accuracy; yet this is precisely what this school of interpreters are wont to attempt. Our Lord himself, in the eschatological discourse with which the Apocalypse is related, forbids our calculations by denying the possibility of knowing the time of that event, about which these calculations are most busy, his future Advent. (c) This theory seems to separate the book from the time in which it was written, and to deprive it of any great

practical value for the succeeding ages, a time of complete fulfilment approaches. (d) In addition to the want of harmony among the interpreters of this school we must notice the erroneous exegesis commonly employed in advocating the various theories; historical events are selected to suit the theory; some very puerile selections are to be noticed in nearly every scheme; the meaning of the symbols, the meaning of the Greek words, even the questions of textual criticism, are dealt with in a way that is utterly unjustifiable on the principles of scholarly exegesis. But the effort to discover fulfilment of prophecy has such a fascination that this system of interpretation includes among its advocates not only the ignorant mystics, but some of the most illustrious and devout exegeses of recent centuries. There can be no doubt, however, that in modern times the general effect of the elaborate schemes of historical interpretation has been to weaken the authority of the Apocalypse. The book itself has suffered from the mistakes of its would-be interpreters, who make "John a pedant, puzzling his readers with his superior knowledge of petty details, instead of a comforter, consoling and strengthening their hearts by revelation of the true relations and final outcome of things." (Warfield.) (4) The *ethical and spiritual* system of interpretation had its advocates in Alexandria in the early Christian centuries. At present it finds able supporters. The general principles on which this method proceeds are: (a) The Apocalypse covers the whole period from the First to the Second Advent, but is not designed to indicate the length of that period, nor the historical sequence of events. Time is not reckoned, though the beginning and the end, the conflict and its issue, are distinctly indicated. (b) The Apocalypse sets forth "the action of great principles and not special incidents" (Milligan). This gives to it a permanent value for all ages. (c) The figures of the book, material and local, are to be interpreted in a spiritual and universal sense. The visions are therefore regarded as synchronous, not successive. The three main principles set forth in the Apocalypse are: the conflict of Christ's people, the preservation of that people, and the ultimate triumph. Not only conflict but apostasy and degeneracy are predicted, and also final victory. This view does not accept a chronological explanation of the "millennium." The spiritual lessons of the book, on this view of it, are marked, and pertinent to every age. It reiterates the injunction of the Master in his discourse on the same subject.

It is probable this last theory may be combined with some features of the historical system; but until the great drama is nearly closed, it will not be possible to prove that the Apocalypse presents a series of predictions to be historically fulfilled. Meanwhile there can be no question that the practical value of the book for the Christian life is furthered by the "ethical" theory of interpretation far more than by any of the others.

Literature.—The BRITANNICA fails to notice the immense British and American literature. The following list is selected exclusively from this class. The various articles on the Revelation, in Smith's *Bible Dictionary*, McClintock and Strong's *Cyclopædia*, the Schaff-Herzog *Cyclopædia*, each with a bibliographical list; the prolegomena to the *Commentaries* of Stuart, Alford, Lee (*Speaker's*), Milligan (*International*); Schaff, *History of the Christian Church*, vol. i. (1882), pp. 385-390, 416-422, 825-853; Godet, *Studies on the New Testament*, Eng. trans., pp. 294-398; Farrar, *Early Days of Christianity* (N. Y., 1882), vol. ii, pp. 103-352; Treuch, *Commentary on the Epistles to the Seven Churches* (2d ed., London, 1861); Wordsworth, *Lectures on the Apocalypse* (London, 1852); Elliott, *Horæ Apocalypticæ* (5th ed., 1862); Milligan, *The Revelation of St. John*, Baird Lecture for 1885 (defending the ethico-spiritual theory of interpretation).—*Commentaries*: Moses Stuart, new ed., 1864, (præterist); Alford's *Greek Testament*, vol. iv. (historical); Lange and Craven, *Lange's Commentary*, vol. x., New Testament, 1874; Lee in *Speaker's Commentary*, 1881 (historical); Milligan, *International (or Popular) Commentary*, vol. iv. (New York, 1883). The older literature is of im-

mense extent, but the movement of history has shown most of the detailed expositions to be false and fanciful.

(M. B. R.)

REVERE, PAUL (1735-1818), immortalized by one of Longfellow's poems, was born in Boston, Jan. 1, 1735. He was of Huguenot ancestry, and was trained in his father's trade as a goldsmith. In 1756 he served as a lieutenant of artillery at Fort Edward, near Lake George. After establishing himself as a goldsmith at Boston he learned the art of copper-plate engraving, and produced in 1766 a print emblematic of the Repeal of the Stamp Act. Others of his designs were the Boston Massacre (1770), Landing of British Troops in Boston (1774). In 1775 he engraved the paper money ordered by the Massachusetts Congress. He was also commissioned by that body to learn the art of making gunpowder, and to set up a powder-mill. He took part in the destruction of tea in Boston harbor. On the night of April 18, 1775, occurred his famous ride, in which he notified the people of the British expedition to seize the military stores at Concord. He was lieutenant-colonel of artillery in the State service during the Revolution, and was engaged in an expedition to the Penobscot in 1779. After the war he was engaged in copper rolling at Canton, Mass., which business has long been carried on by the Revere Copper Co. He died at Boston, May 10, 1818.

His grandson, PAUL JOSEPH REVERE (1832-1863), graduated at Harvard College in 1852, served with distinction in the civil war, rising from major to colonel, and was killed at the battle of Gettysburg. Another grandson, E. H. R. Revere (1727-1862), was surgeon of a regiment and was killed at the battle of Antietam.

RÉVILLE, ALBERT, French author, was born at Dieppe, Nov. 4, 1826, where his father had been pastor of a Protestant church. After entering the ministry he was vicar at Nîmes, then pastor at Luneray, and in 1851 was called to the charge of the Walloon church at Rotterdam. At various times he returned to France to take part in the religious conferences, at which he advanced rationalistic and non-Christian views. In 1880 a professorship of the history of religions was formed in the Collège de France, at Paris, and Réville was called to the chair. In 1886 he was called to preside over the section of religious studies in the school of higher studies then established in the old Sorbonne. Besides translations from the English and German he has published *Essais de critique religieuse* (1860); *Histoire du dogme de la divinité de Jésus Christ* (1869); *L'Enseignement de Jésus Christ* (1870); *Prolegomènes de l'histoire des religions* (1881); *Les Religions des peuples non-civilisés* (2 vols., 1883); *Les Religions du Mexique, de l'Amérique centrale et du Pérou* (1884).

REVIVAL, RELIGIOUS. It is a historic truth that the spread of Christian doctrine and Christian life has not been uniform in its rate of progress. The growth of the church was much more rapid in the apostolic age than it has been at any subsequent period. Before the apostles had passed away Christianity had entered the imperial palace at Rome, and its doctrines were taught and embraced in all parts of the empire. In three hundred years from the death of Christ the Pagan empire had passed away, and the Christian empire had taken its place. We look in vain to see any such movement of conquest or of missionary effort on the part of the church after these early centuries until the renewed zeal of the Roman church appears in the 16th century, as awakened by the great separation from that church in the Reformation, and by the discovery of new continents beyond the Atlantic. Very much of the growth indicated both in the time of Constantine and in that of Xavier was superficial, and had no relation to conviction and to spiritual life. Political agencies and personal advantage were prominent factors in the establishment of the nominal church when worldly power was centred in its hierarchy, which of course cannot be alleged regarding the progress of Christianity at the first, when persecution and death attended the Chris-

tian profession, and the doctrines preached antagonized the natural passions of men.

But it is also historically true that in the growth of the church there have been periods when spiritual religion especially flourished in certain localities, where a new devotion has marked the lives of Christians, and great numbers have been added to the church from deep conviction, in true repentance and with sincere faith.

It is to these movements that the name of Revivals is generally applied. Two theories obtain concerning them—one that they are the direct result of human machinery, if we may use that term in a qualified way, and the other that they are entirely of divine origin and production, not dependent in any sense on human action. Under the former theory a revival can be had almost whenever the church wishes, and under the latter no church effort is of any avail. Under the former theory there is danger of a mechanical process being inaugurated, and men busy themselves in "getting up" a revival, as they would a concert or a fair. In such cases the door is open for all sorts of extravagance, discreditable to the name of religion. Under the latter theory there is danger of apathy, and men cease to feel their responsibilities as Christians with a divine commission to evangelize. The truth lies between the two theories. The essential power in a revival is undoubtedly the Spirit of God, but it is no derogation from his prerogative that he works through the faithful sons of men, and we may hence believe that a prayerful state of the church will be accompanied with spiritual enlargement and numerical growth. If the church were always equally prayerful (and by that is implied a true life) we might expect a steady and rapid growth instead of sporadic starts and ensuing stagnation.

In point of fact, we have the alternations. We find historically that the beginning of this century developed, in the churches of Great Britain and America, a zeal for foreign missionary work. At the same time Bible societies and tract societies sprang up and scattered the written word over the earth in scores of languages. In America several special seasons of renewed fervor and large accessions to the church are noted, as the Great Revival or Awakening in the days of Jonathan Edwards (1751), and the later ones of 1831 (with which the name of C. G. Finney is associated) and of 1857. Some early revivals in Kentucky and other Western States, and that in Ireland in 1859-60, were remarkable for many manifestations of a physical character in the converts, which only a superficial criticism will attribute to hypocrisy or wantonness. It is not strange that when suddenly the great realities of the unseen world and the relations of a holy God to the human soul are made known, the body should be affected by the shock of surprise and fear sustained by the spirit. The reality and sincerity of these bodily affections we cannot doubt, while we also recognize the fact that such periods of excitement will induce evil men to ply their hypocrisies, and it is often difficult to separate the true from the false.

It is because of these evils which attach themselves to revivals that many Christians have no confidence in revivals, and dislike both the name and the thing. But this is hardly consistent with a discriminating piety that will encourage the true, even though the false is at its heels. As men are, and as the church is, it seems that Christians have to be awakened again and again to new devotion and zeal, and hence revivals are to be sought and expected, until the church shall have been fully consecrated to its evangelizing work as designated in the Saviour's commission: "Go ye into all the world, and preach the gospel to every creature."

(H. C.)

REVOLUTION, AMERICAN.—At the conclusion of the war with France in 1763 the heavy indebtedness of Great Britain induced the consideration of a plan of laying taxes upon her American colonies.

The supremacy of Parliament was regarded as sufficient sanction for this action, but the colonies had through the exercise of the power of self-taxation come to consider that power as of right belonging to them. Their charters, derived directly from the crown, asserted for them the same rights that Englishmen enjoyed at home, and this they construed to mean that as Englishmen could not be taxed except by the consent of their representatives, the same right appertained to the inhabitants of the colonies, and as they had no representation in Parliament that body could not impose taxes upon them. A resolution of Parliament passed in 1764 proposed the imposition of a stamp duty on the colonies. This resolution was followed by an act providing that the instruments of commerce should be null and void unless having a stamp, for which a duty must be paid. To the passage of this act opposition was made, and among other grounds upon that of the colonies having no representation in Parliament, to which reply was made that the colonies were virtually represented as were certain cities of Great Britain. The operation of this Stamp Act being suspended for a few months, the people of the colonies were hesitating as to the course they should pursue when Virginia, in May, 1765, adopted resolutions, offered by Patrick Henry, that denied the right of the British Parliament to impose taxes upon that colony, claiming that right exclusively for the legislative authority of the colony. These resolutions were well received throughout the colonies, especially in New England. The imposition of the stamp duty was regarded as the assertion of a right of taxation which if submitted to would lead to still further encroachments upon the liberties of the colonies and would place intolerable burdens upon them. A congress of the colonies was called and representatives from nine of the colonies met at New York, Oct. 7, 1765, those from Virginia, North Carolina, and Georgia being prevented from attending by the governors of those colonies. This convention asserted the freedom of the colonies from taxation except that imposed by themselves, and forwarded petitions to the King and Parliament.

The Stamp Act was disregarded by the colonies. The colonists agreed to purchase no goods from Great Britain and betook themselves to domestic manufactures. Their refusal to purchase articles of luxury and even of necessity of English manufacture brought great distress upon artificers in England. The Stamp Act was repealed in March, 1766, but the absolute supremacy of "the King in Parliament" was still asserted. The people of the colonies from this time assumed a more independent tone in regard to their relations with Great Britain.

In June, 1767, Parliament enacted a law placing duties upon glass, paper, painters' colors, lead, and tea, in the colonies. Commissioners were sent to Boston to enforce the collection of this revenue, and the opposition of the people and their threatening attitude induced the sending of troops and vessels of war to protect the commissioners. Two regiments were quartered in Boston from September, 1768, until after the street fight known as the "Boston Massacre" in March, 1770. The proposition made in Parliament to take persons charged with treason in the colonies to Great Britain for trial again aroused the opposition to the use of manufactured goods of Great Britain. The British manufacturers being again made to feel the consequences of "non-importation agreements" Parliament was induced to repeal the tax except as to tea. The colonists refused to import tea and the expected revenue from that source failed. A project in the interest of the East India Company for the direct importation of tea into the colonies aroused at the same time the jealousy of the merchants whose trade would thus be interfered with and the patriotism of the people of the colonies at large. The people regarded attempts to force tea upon them as intended to secure

the recognition of the authority of Parliament to levy taxes upon America, and became more determined in opposition. A convention at Philadelphia condemned the tax on tea and the attempt of the East India Company to force it on the colonies, and declared those who should countenance this scheme as enemies of the country. The opposition of the colonists induced the return to Great Britain of the ships that were conveying the tea, excepting those sailing for Boston, where there was a military guard to protect them. They arrived at that city, but the tea was thrown in the harbor by persons disguised as Indians, Dec. 16, 1773. Parliament in the following March, indignant at this outrage, directed the port of Boston to be closed. An attempt was also made to change the charter of Massachusetts so as to deprive that colony of popular representation in one branch of its Legislature and to substitute appointees of the Crown. The authority of the town-meetings and the selection of jurors were interfered with to secure more perfect subjection to the authority of Parliament. The governor was allowed to send persons charged with murder or other capital offences to Great Britain for trial. These measures excited the indignation of the people of all the colonies. It was recognized that all the colonies had a common cause in opposing these laws, as they were an attack upon American liberty that would finally embrace all of the colonies.

By the Quebec Act an attempt was made to enlarge the government of that conquered province so as to encroach upon the colonies and to promote the interest of despotic rule in America. Throughout the colonies the people assembled and expressed in resolutions their sympathy with Boston and their common interest in the events there taking place. "Committees of correspondence" were appointed to facilitate intercommunication throughout the colonies. The situation was intensified by the exhibition of a greatly increased military force in Boston. The inhabitants of that liberty-loving town suffered from the closing of their port, but received assistance from Salem and other neighboring towns, whose ports derived commercial benefit from the misfortune of Boston. This advantage to the neighboring ports had been counted upon in Great Britain as likely to detach them from the interests of Boston. A league and covenant against trade with Great Britain was made by the colonists, and denounced as traitorous by that government, and those connected with it ordered to be arrested.

The plan of reorganizing the government of Massachusetts was deprived of practical efficiency by the excitement and rising of the people of that colony and their taking the public authority in their own hands. A committee of safety was appointed at Boston and "minute men" selected to stand ready at any moment for such military duty as might be required of them. Other colonies united with Massachusetts in such military preparations. Seizures of arms and ammunition took place in various localities. A provisional Congress in Massachusetts replaced the regular Legislature and sustained the popular rights as against the Crown. A Continental Congress was convened in Philadelphia, Sept. 5, 1774, and twelve colonies were represented in it. The Congress was loyal to the Crown, but devoted to the rights of America. In this Congress controversies as to the relative claims of large and small colonies to representation led to a single vote being allowed to each.

Congress assented to the regulation by Parliament of the external commerce of the colonies, but declared the invalidity of attempts to impose taxation without the consent of the colonies. It demanded the rights of the common law of England as to trial by a jury of the vicinage, and insisted upon the immunities secured by their charters. It claimed the right to assemble and petition for the redress of grievances, and against the presence in the colonies of a standing army.

It also protested against selection by the Crown of councillors to take part in the legislation of the colonies. It demanded the repeal of the obnoxious acts as violations of the rights of the colonies, and enumerated such acts, including those already mentioned, as open to such objections. It recommended non-intercourse, non-consumption, and non-exportation, and the stoppage of the slave-trade.

Upon the report of these proceedings, Parliament sanctioned the ministerial plan of increasing the military force in the colonies, 10,000 men being provided for Boston. As a retaliatory measure a bill was passed in Parliament to prevent intercourse between the colonies and other British possessions in America, having special reference to the colonial trade with the West Indies and the fisheries, which the colonies held in high estimation.

In the meantime military activity commenced. A hasty expedition to destroy military stores that had been accumulated at Concord first brought the British troops into conflict with the people, armed and banded. In the skirmishes at Lexington and Concord, April 19, 1775, the first blood of the impending conflict was shed. The news of these fights roused to greater intensity the patriotic ardor of the colonists everywhere, and the battle of Bunker's Hill, June 17, determined irrevocably the issue as one of arms. The Congress at Philadelphia had recommended at its adjournment the calling of another Congress in the following year. That body, when it assembled in May, 1775, advised a defensive attitude, but that the building of fortifications by the royal governors should not be permitted, and recommended that more rigid provisions should be made as to non-intercourse with the British possessions. It established a general post-office and made a declaration of its position as loyal to the mother country but determined to resist tyranny by force. Washington was at this time appointed commander-in-chief of the provincial forces, and provision was made for raising troops, bills of credit being issued for that purpose. With all its caution in holding to established forms and its professed loyalty to the Crown, this second Continental Congress was a purely revolutionary body.

During the year 1775 the King proclaimed the existence of open rebellion in the American colonies, and Parliament made the necessary military preparations for war with them. It passed an act to compel all Americans found in captured vessels to serve as seamen in the British service; foreign troops were engaged under treaty with Hesse-Cassel for service in America, and Sir William Howe was placed in chief command. These actions of both King and Parliament had their reaction in the colonies by stimulating the growing desire for independence until it culminated in the Declaration of Independence. (See INDEPENDENCE, DECLARATION OF.) This measure, adopted July 4, 1776, by a nearly unanimous vote in Congress, was the starting point of American nationality. With this declaration British sovereignty was denied throughout the colonies and public authority exercised in the name of the people. The colonies assumed the title of States and reorganized their internal governments. While the Declaration of Independence was under consideration, measures were being taken to bring about more definite confederation among the States. The scheme of confederation was carefully considered with a view to securing the proper conduct of those matters of common interest, bearing directly and indirectly upon the existing state of war, that demanded a common authority of confederated States. Articles of Confederation were passed by Congress in 1777 and ratified in 1778 by all the States, except Delaware and Maryland, and subsequently by these States. (See CONGRESS.)

The important advantages of an alliance with France early attracted the attention of Congress, and in 1776 commissioners, of whom Benjamin Franklin

was one, were sent to negotiate such alliance and to seek aid from France and the French people. In the latter part of 1777 proposals were made to the commissioners on the part of the French government embracing the acknowledgment of the independence of the United States and aid towards the maintenance of that independence, upon the condition that no return to obedience to Great Britain should take place on the part of the States. A treaty was concluded in 1778, one of the motives to which on the part of France was a desire to diminish the commercial advantages of Great Britain. This treaty was one of amity, commerce, and alliance, no special advantages either political or commercial being conceded to France as the price of this friendly act on her part. A secret provision was made for the admission of Spain to the alliance.

The British Parliament on learning the state of relations between France and the States promptly passed conciliatory acts intended to win the States from this alliance to their former relations to the British government, but Congress as promptly declined to accede to the terms of conciliation proposed. A cessation of hostilities was embraced in the proposition on the part of Great Britain, looking to the restoration of amicable relations under the sovereignty of Great Britain and tending to place the States in a federal relation to Great Britain that would secure to them a large control over their internal affairs. To this proposition the reply of Congress was, that while desiring to conclude an honorable treaty of peace the idea of dependence upon the Crown could not be entertained. The alliance between France and the States involved that country in war with Great Britain, to which ultimately Spain became a party, and British interests suffered from these combined enemies.

The financial condition of the new nation embarrassed its military operations. As the first preparation for war had included the emission of bills of credit, so that source of obtaining the supplies necessary to carry on the war was resorted to until its exhaustion in 1780. Congress had no authority to enforce taxation within the States or to compel them to contribute their just proportion to the public service, and hence the resort to the issue of bills of credit was the only available means of raising revenue within the power of Congress. The credit of these bills was for a time sustained, but at last, as the emission was continued from year to year, decline in their purchasing value commenced, and continued until the issues had reached two hundred millions, when the depreciation was so great that necessity compelled a resort to other means. Resort was had to forced contributions exacted by the military power as necessary for its maintenance. An attempt was made to obtain from the States material supplies in lieu of their quotas of money, but failed. An attempt was also made to absorb this currency by taxation and to replace it by new issues, but this was not successful. (See FINANCE, *Revolutionary Period*.)

While affairs in the States were apparently approaching a failure of the resources for maintaining the war the difficulties surrounding the British position in Europe were increasing. The opposition of the states of Europe to a British monopoly of American trade had already engaged France and Spain in hostility to that country, and the motive to open commerce with America operated upon other powers. The rigor with which Great Britain exercised belligerent rights upon the seas interfered with neutral trade and led to a proposed coalition, termed the armed neutrality, intended to support more liberal ideas of neutral rights. Holland became involved with the American question, and war was declared against her by Great Britain. The years 1780 and 1781 were the culminating point in the financial embarrassment of the country. The failure to pay the troops, their sufferings for want of supplies, and their retention after their term of enlistment had expired from inability to

refill the ranks as rapidly as was required, produced mutiny in a portion of the army, which, however, was readily quelled without resort to force and without any advantage resulting to the enemy therefrom. The depreciation of the bills of credit which brought on these difficulties at last caused their withdrawal from currency. Relief came to the finances of the country from its friendly relations with European powers, loans and other transactions being made that brought gold and silver into the country. Advantage was taken of this circumstance to place the transactions of the government upon a coin basis, and this change, with the accession of Robert Morris to the financial management, gave partial relief to the overstrained financial situation. The depreciated currency by common consent passed out of circulation without popular commotion, as an expression of the patriotic sentiment of the country. Before the close of the year 1781 the tide of military affairs had turned in favor of the American arms, culminating in the surrender of the British force under the command of Lord Cornwallis, at Yorktown, Oct. 19.

In 1782 a pacific feeling developed not only in Great Britain towards the States but among the European belligerents involved in the American question. The disposition to treat with the States on the basis of independence appeared in Parliament and a change of ministry gave an impetus to the movement. Commissioners were received from the American Congress and negotiations entered upon. John Adams, Benjamin Franklin, John Jay, and Henry Laurens constituted this commission. Provisional articles of peace were agreed upon between Great Britain and the United States, to be inserted in the future treaty of peace. To such treaty France was to be a practical party. By these articles the independence of the United States was fully recognized, with liberal boundaries, including the east side of the Mississippi and both sides of the Ohio, and a right of free fishery secured on the Banks of New Foundland. The treaty of peace following the terms of the articles was concluded at Paris, Sept. 3, 1783, thus terminating the American Revolution, and placing the United States in general recognition as a sovereign national power.

See Ramsay's, Hildreth's, and Bancroft's *Histories of the United States*. For an outline of the war by which American independence was achieved see the following article.

(A. J. W.)

REVOLUTIONARY WAR, AMERICAN. This war began in a revolt of the American colonies of Great Britain, which colonies soon after constituted the thirteen United States. The first skirmish between organized forces took place at Lexington, Mass., April 19, 1775. The preliminaries to peace were signed at Paris, France, Nov. 30, 1782; so that a state of war existed for seven years and seven months.

The Causes.—The Declaration of Independence, issued by a Congress of Delegates July 4, 1776, explicitly sets forth the grounds of separation from Great Britain, and these were substantially the causes of the war. Two expressions therein appear to summarize the views of those who resisted by arms the forces of the mother-country. First, "When a long train of abuses and usurpations, pursuing invariably the same object, evinces a design to reduce them (the people) under absolute despotism, it is their right, it is their duty to throw off such government and to provide new guards for their future security." The second is: "The history of the present king of Great Britain is a history of repeated injuries and usurpations, all having in direct object the establishment of an absolute tyranny over these States."

Not only the claims of the tyrannous king, but the Acts of the British Parliament which sustained him, were the grievances detailed in that Declaration. The most vehement protest therein is against attempts at taxation without representation. But long before

the Declaration, the home government had undertaken by its army and navy to enforce its measures and to compel its subjects in America to submit to its exactions. This positive action was resisted by open force till all the new States became united and put an army into the field, and so the primary revolt became a *bona fide* revolution. The new army is usually named the American or Continental troops. The central supreme authority was vested in the general Congress. The very existence of this Congress was in the eyes of the British Cabinet and Parliament a cause of war, and continued so till at its close the independence of the States was acknowledged.

First Campaign, 1775.

The people of Boston and the vicinity had been forward and persistent in their opposition to the unfriendly acts of the British government until, to withstand them, several war measures were set on foot. The first showed itself in the action of Gen. Thomas Gage, the royal governor of Massachusetts. He brought from Halifax to Boston two regiments of the line, and promised his king "with five regiments to keep Boston quiet!" Next came the proclamation and enforcement by Gen. Gage of the Boston Port Bill, which went into operation June 1, 1774, and effectually closed the port. The custom-house was removed to Salem, and the Bostonians were subjected to the hardships of a regular blockade. About this time the British reinforcements called for came, raising the forces to upwards of 10,000 men, exclusive of the naval squadron numerous enough for the work assigned to it. With these troops appear the names of Gens. Howe, Burgoyne, Sir Henry Clinton, Lord Percy, and Lord Rawdon; names which in the war became famous as able commanders.

Gen. Gage began his operations as if to subdue and control a riotous city. He encamped his artillery on Boston Common, crowned Fort Hill with Welsh soldiers, and sent a field-battery to hold Boston Neck, the only land entrance to the city.

Affairs of Lexington and Concord.—Next, in his double capacity of governor and general, Gage directed that all the munitions of war within his precincts be brought forthwith to Boston. To make a beginning he sent out two companies which in the night removed a large quantity of powder from Charlestown to the city and deposited it in Castle William. This act excited indignation and alarm among the patriots in the surrounding country, and they quickly armed themselves and ran together at their appointed rendezvous. On April 19, 1775, 800 "loyalists," in two detachments commanded by Lieut.-Col. Francis Smith and Maj. Pitcairn, were marching toward Concord, 16 miles from Boston, where they were to seize and destroy sundry military stores which the general's spies had there found. At Lexington the advance was resisted by about 70 militiamen under Capt. John Parker. The British, after short parley, fired upon the patriots, killing 8, including Capt. Parker, wounding 9, and scattering the remainder. In this encounter but one "loyalist" was wounded. The patriots in greater numbers next gathered near Concord; quite a battle took place; and the return march of the British, from the incessant flanking and pursuit of their ever-increasing foes, who had put themselves under the able Gen. William Heath, became an annoying and finally a disorderly retreat. On arrival in Boston they found that they had lost 68 killed, including Lieut.-Col. Smith, 178 wounded, and 26 missing. The patriot loss was 101 put *hors de combat*. Thus the campaign was opened.

Ticonderoga, Crown Point, and Fort St. Johns.—Benedict Arnold, who came to Cambridge from New Haven with a company, proposed plans to committees of safety of Massachusetts and Connecticut for seizing Ticonderoga and other forts; having received authority and commission of colonel he began enlisting men.

But the Connecticut people, improperly using his plan, arranged another expedition. Some of their own men joined the "Green Mountain Boys," making in all about 140 soldiers under Col. Ethan Allen. Arnold, without troops, overtook Allen at Castleton, but not being allowed to command according to his commission, he nevertheless went with the expedition. May 10, 1775, they surprised the garrison. The startled commander, Capt. Delaplace, yielded to the inevitable, surrendering 2 officers and 48 men, 182 cannon, and an abundance of public stores. Col. Seth Warner, with a detachment of these patriots, captured Crown Point, May 12, with 11 prisoners and 111 pieces of artillery. A number of Col. Arnold's men having come, he and Allen put on foot, on May 14, two expeditions against St. Johns, situated near the foot of Lake Champlain. Arnold surprised the fort, took the small garrison prisoners, and departed, carrying off a sloop of war manned with 16 guns, and many stores. Allen arriving a little later, with his 60 men, took possession of the abandoned fort. But during the ensuing night a British officer having 200 men and a 6-gun battery arrived, when Col. Allen with his "Green Mountain Boys" was dislodged.

First Naval Affair.—Meanwhile, on the coast of Maine, occurred an amateur naval encounter. The *Margaretta*, a British armed sloop, carrying 4 six-pounders, 20 swivels, 2 wall-pieces, and plenty of small arms, early in May convoyed two other sloops to Machias, Me., for lumber. The war news from Lexington arrived Saturday, May 9. Sunday several patriots undertook to seize the captain, Moore, and his officers at church. They escaped by the windows. The *Margaretta* gave the town some parting shots and dropped down the bay four miles. Monday, Joseph Wheaton and several patriots seized one of the sloops and, armed with fowling-pieces, pitchforks and axes, and small supplies, gave chase. The sloop, a swift sailer, overtook the *Margaretta* after she had put to sea, engaged her at close quarters, and after a hard but brief struggle, in which Moore himself was slain, captured the vessel and all on board, 40 in number. This feat is called "The Lexington of the sea."

East Boston was in 1775 Noddle's Island; and Hog's Island is to the north-east. These were used largely for stock. To save the herds from capture the committee of safety sent, the 27th of May, a detachment to escort them back into the country. Forty British marines resisted, killing horses and cows and doing much other damage. Seeing the situation Col. Israel Putnam and Dr. Joseph Warren brought up reinforcements, drove off the marines, and finally captured their armed schooner, which Putnam dismantled and burned. Putnam's rapid advance to the rank of Major-General in the Continental army is attributed to this fortunate skirmish.

Bunker's Hill.—By the second week in June, 1775, there were gathered from different States, in the outskirts of Boston, about 15,000 men. "They were subordinate through inclination . . . depending for sustenance on supplies sent from their several towns." Gen. Artemas Ward, the nominal senior, was at Cambridge with 9000 men; Gen. Thomas, second in command, with 5000 more, and 3 or 4 batteries, held the right at Roxbury and Dorchester; while the left, a thousand strong, principally of New Hampshire volunteers, extended to the bay. This force, oddly armed and strangely clad, were making a partial siege of Boston. Learning that Gen. Gage intended a series of operations, beginning with the taking of Dorchester Heights the night of June 18, these patriots determined to anticipate his action. So Col. Prescott, with a thousand soldiers with two pieces of artillery and intrenching tools, at 9 P. M. on the 16th marched to seize and fortify Bunker's Hill; but Breed's Hill, a little nearer Boston, was first taken and intrenched; and Bunker's Hill afterwards crowned with a redoubt. About noon the British troops under the immediate

command of Gen. Howe moved up to the assault of the works on Breed's Hill. He took the right, Gen. Pigot the left, while Gen. Sir Henry Clinton brought up the reserves. Thousands of spectators, on points of observation, eagerly watched the splendid panorama. The British were twice terribly repulsed. At last, about 4 P. M., Howe succeeded in gaining the hill, and Col. Prescott slowly drew off his forces, via Bunker's Hill, across the Neck to his camp of the previous day. Howe had in action between 3000 and 4000 men; Prescott not to exceed 1500, after the reinforcements came to him. Howe's loss, killed and wounded, was 1054; Prescott's, including the missing, was 449. Notwithstanding the loss of the field, this battle was to the patriots in its results equivalent to a victory.

The Evacuation of Boston.—Washington having been made general-in-chief, arrived and took command July 3, 1775. Discovering the enemy's disciplined force to be 11,500 strong, and his own mostly raw levies not to exceed 14,000, he saw that more men were needed for the siege. He asked for a force of 22,000. Soon recruits flowed in; but there were on hand less than 10,000 lbs. of powder. "The Continental army" was now organized. Two brigades, Thomas' and Spencer's, made the First division under Maj.-Gen. Ward; Sullivan's and Greene's the Second division under Maj.-Gen. Lee, and there was a reserve of six regiments under Maj.-Gen. Putnam. Gradually, awakening a few skirmishes and bombardments from the British redoubts and war vessels, Washington closed in, till land-egress from Boston was cut off. American cruisers, authorized by Congress, began to worry the British squadron. They captured supply vessels *en route* to Boston. On Oct. 10, 1775, Gen. Gage gave up the city to Gen. Howe and sailed for England. Washington for good reasons threatened but constantly postponed a general attack; but by night enterprises he seized important heights that commanded the city. In rebuttal, Gen. Howe made ready to assault Dorchester Heights the night of March 5, 1776, and Washington, knowing his intention, planned to enter Boston from the opposite quarter. Providentially a terrific storm prevented the movement, and, in view of growing want and harassment, however humiliating, the proud British general decided to evacuate Boston. By a tacit understanding Washington was not to fire upon the retiring army if the city were spared. So, on March 17, Howe's forces embarked and put to sea, escorted by the naval squadron, except a small fleet under Commodore Banks left to keep possession of the harbor entrance. After enduring for some time this annoyance, Gen. Lincoln with 1200 troops, including artillery and a mortar equipment, was sent to dislodge the fleet. From Long Island and some other convenient points he at last brought his guns to bear upon the shipping; so soon as the commodore's flagship was reached by the shot, he gave the signal of departure. The fleet left June 18. The spreading news caused great rejoicing to the patriots and unstinted praise to Washington and his coadjutors.

Expedition against Canada.—The early enterprise of Allen and Arnold, near Lake Champlain, caused other northern expeditions. Sir Guy Carleton, governor of Canada, inaugurated movements to recover his captured forts. Gen. Schuyler, stationed by Washington at Albany, and later at Ticonderoga and Fort Edwards, as a sort of department commander, was watching Carleton's operations, effected largely by "Tory" levies and hired Indians. In June, 1775, he was sent to command in an offensive expedition. He led an army of some 2000 men to go by the way of Vermont and Lake Champlain; but becoming suddenly ill, was replaced by Gen. Montgomery. The latter captured Fort Chambly, St. Johns (which Allen had lost), and Montreal, and then pushed on down the St. Lawrence to the vicinity of Quebec. Gen. Arnold, with fuller instructions directly from Gen. Washington, made an

extraordinary march through the forests of Maine and succeeded in forming a junction with Montgomery. After a partial siege, the works of Quebec were, on Dec. 31, during a winter storm, simultaneously assailed by several attacking columns. The patriots were at last repulsed, Arnold badly wounded and the brave Montgomery slain. The little army, held together by Arnold, spent the winter a short distance from Quebec. Arnold's wound, opened afresh by an accident, caused his relief of command. His successors were finally, by the middle of June, 1776, forced from Canada by the famous Burgoyne, who, with large reinforcements to Carleton, had appeared on the scene. But the main cause of all disasters in this well-planned campaign was a continued insubordination. For the patriots it required time and mutual suffering to allay such sectional jealousies as weakened and at last destroyed this important expedition.

Great Bridge.—Lord Dunmore, governor of Virginia, declared martial law, perpetrated a series of depredations, began to use Tories and Indians, and spread terror far and near. His forces assembled near the armed vessels at Norfolk. He planned the destruction of military stores at Suffolk. To hinder this, Col. William Woodford led his troops, about a thousand strong, in that direction. Anticipating patriot Woodford's design, the governor dispatched about 200 regulars and some 400 others with artillery to the "Great Bridge" across the Elizabeth River. Here the commander intrenched impregnably and covered every approach. But Woodford by a ruse drew an attack upon his men in position and so completely defeated his adversary, Dec. 9, 1775. Fordyce, leading the grenadiers, lost 60 men and his own life. Woodford seized Norfolk, but the enemy, taking shipping, burned the town.

Second Campaign, 1776.

The British ministry planned first to aid their Southern colonial governors and then combine all their powers, military, naval, and diplomatic, to get possession of New York and make that city their principal base. Accordingly on Jan. 12, 1776, Lord Cornwallis set sail from Cork with some six regiments, under escort of Admiral Sir Peter Parker, with a large naval contingent. On May 3 the fleet arrived at Cape Fear, N. C. Sir Henry Clinton assumed command and moved against Charleston. It was there at Sullivan's Island, June 28, that Col. William Moultrie with a few hundred men successfully resisted the combined attack. Without further effort Sir Henry now joined Gen. Howe at Staten Island, the Admiral Lord Howe having there the naval fleet. The incoming Tories gave Gen. Howe hopes of a speedy peace. The royal land troops here amounted to 35,000 men, well supplied. Gen. Washington had possession of New York with his army, such as it was, of about 17,000, and had, after leaving Boston, been busy fortifying all approaches. He put Gen. Greene over the works in the outskirts of Brooklyn, L. I., giving him between 5000 and 6000 men. Greene on the eve of battle had a violent fever and was replaced by Gen. Putnam. His line stretched along the Bedford Ridge in crescent shape; his right wing under Lord Stirling and his left, considerably extended, under Gen. Sullivan. For some unaccountable reason Putnam immediately withdrew his mounted patrols on the Bedford road which led beyond his left through Bedford pass. Gen. Howe first crossed his command to Long Island, took position in front of Putnam, and reconnoitred for three days. He formed three columns for attack, Gen. Grant's opposite Stirling, Gen. De Heister's breasting Sullivan, and Sir Henry Clinton's to aim for the Bedford pass.

Clinton commenced his march at 9 P. M., Aug. 26. He captured a scouting party *en route*, and by daylight the pass, being unoccupied, was held secure. After breakfasting he pushed on through Bedford, driving detached patriot regiments before him, till he struck

Sullivan's rear. Gen. Grant, also moving in the night, began to encounter Stirling's outer lines after midnight. Probably Putnam believed this the main attack. De Heister remained quiet till about daybreak. Hearing that Sir Henry already had the Bedford pass, he pushed on and furiously assailed the position of Sullivan in front. A terrific conflict ensued throughout the field. Putnam was dislodged and badly beaten.

Gen. Washington, however, reinforced the Brooklyn redoubts in time to save a greater disaster. Howe's loss was about 400, while Putnam's was 1200 at least.

Battle of White Plains.—Gen. Washington stood on the defensive till the 29th, when he made a safe withdrawal and for a time posted his army in the northern part of New York Island, but afterward he withdrew to White Plains. Here Gen. Howe, much delayed *en route* by American detachments, at last confronted the Continental army. Washington warily avoided general engagements; but an important knoll, lying between the main bodies, was contended for. This gave rise to a lively action, Oct. 28, 1776. During the night following Washington again retired to North Castle, taking a strong position. From this Howe undertook to manœuvre him away by attempting to carry the forts on the Hudson. Divining Howe's intention Washington, leaving two detachments for observation and reinforcement, one under Lee at North Castle, and the other under Heath at Peekskill, crossed the main body into New Jersey. Without delay the patriot Col. Magaw, holding Fort Washington, was now attacked and defeated, but with heavy loss to the British. Fort Lee on the west of the Hudson was abandoned on the approach of Lord Cornwallis, who had taken the field with 6000 men. Washington deeming it unwise, at that epoch, to risk an engagement, retired before Cornwallis, till on Dec. 8 he passed the Delaware. It was a time of much discouragement to the patriots. Congress fled to Baltimore, while Washington as rapidly as possible gathered in his detachments. Gen. Charles Lee under these orders encamped one night in New Jersey far from his command and suffered capture, but Gen. Sullivan, his successor, speedily completed the march to Washington's position.

Battles of Trenton and Princeton.—Now, feeling a little stronger, the general, choosing a winter's night, Dec. 25, recrossed the Delaware, surprised at Trenton a large force of Hessians under Gen. Rahl and defeated them. Rahl was mortally wounded and a large number of prisoners taken.

For precaution Washington again passed the Delaware, but just then getting a moderate accession from recruits he went back again to Trenton. The delighted Cornwallis moved at once to Trenton, anticipating an easy victory. A small stream only was between the two armies as Cornwallis came into position near night, Jan. 2, 1777. Washington, hearing of a British division left back at Princeton, cautiously withdrew. At sunrise he struck that division in motion. His militia in advance acted disgracefully, but the general with other trusted brigades soon checked the hopeful enemies and put them to flight. The patriot Gen. Mercer was fatally wounded and 30 men only put *hors de combat*.

It was during this spring of 1777 that the patriot cause began to receive some help from abroad. The gallant young Marquis de Lafayette from his private funds prepared a vessel and joined, as a volunteer without pay, the Continental army. Soon Congress gave him a commission of major-general. No American forgets his generous and soldierly assistance. Washington, a master of strategy, proceeds to Morristown and Middlebrook and so threatens Howe's communications till, weary of fruitless efforts, he withdraws to Staten Island.

There were several small expeditions on both sides. In that to Danbury, Conn., Gen. Tryon destroyed quantities of stores and burnt the village. The Connecticut militia under Sullivan, Arnold, and Worcester,

accomplished wonders, pestering Tryon's return march. He lost some 300 soldiers before he reached his shipping. The militia suffered considerably, Gen. Worcester being among the slain.

The patriot Col. Meigs about the same time succeeded in burning the British shipping at Sag Harbor and large quantities of supplies.

Third Campaign, 1777.

The next project of the British was for Gen. Howe, co-operating with Admiral Howe, to capture Philadelphia and clear out there all obstructions and hostile forces; also for Gen. Clinton, left at New York, to hold that base, open up the Hudson, and finally form junction with Burgoyne's army coming down from Canada. The admiral took on board 18,000 men and Gen. Howe in command, and set sail. As soon as Washington ascertained their destination to be the Chesapeake and Philadelphia he hurried forward his little army and offered battle. The position was the eastern bank of the Brandywine, Chadd's Ford being the centre. He deployed along the creek. Sullivan commanded the right wing; Wayne had Chadd's Ford; Armstrong took the Pennsylvania militia, *i. e.*, the left; while Greene held one division in reserve. The British commander on Sept. 11, 1777, masked Washington's front by Knyphausen's command. From a road fork to his rear, Howe sent the rest of his army under Cornwallis 17 miles around his enemy's right. The attack on Sullivan's right rear was almost a surprise. There was desperate fighting; Sullivan was defeated, but Gen. Greene got to him in time to cover his retreat. Wayne held his own against Knyphausen till the other operations forced him to retire with the whole left. Washington suffered a great discomfiture, but by Howe's delay he reorganized at Chester. Lafayette, of Washington's staff, served by request with Sullivan and was wounded. Congress left Philadelphia that night for Lancaster. Washington on the 12th succeeded in crossing the Schuylkill to Germantown. Wonderful to tell, this defeated army recrossed the Schuylkill Sept. 14, and again confronted Howe for battle; a fearful storm of 24 hours' duration alone prevented a desperate conflict. With ammunition wet, Washington disappointed drew off. He crossed the river again at Parker's Ford, but sent back Wayne and Smallwood with about 1500 men to strike Howe's trains. The effort brought on the affair of Paoli, Sept. 20, 1777, where the over-confident Wayne allowed himself to be surprised and defeated. Gen. Howe next, on Sept. 21, pushed up the right bank of the Schuylkill. Washington followed the movement abreast on the other bank to Pott's Grove. Suddenly, on the night of the 22d, Howe marched back, crossed the Ford and entered Germantown. This time Washington was out-manœuvred. On the 26th Howe sent Cornwallis to Philadelphia, who with much pomp took possession of the capital city. Meanwhile Gen. Washington remained in position, drawing in detachments and giving his army a much needed repose.

Burgoyne's Operations.—Gen. Burgoyne left Canada the middle of June, 1777, with 10,000 men including Indians. The American Gen. Schuyler, at Fort Edward, N. Y., opposed him, and under Schuyler, Gen. St. Clair with 3,000 men garrisoned Fort Ticonderoga. Burgoyne drawing near seized Mount Defiance and planted batteries completely dominating the fort. St. Clair, too late apprised, retreated, aiming for Fort Edward. Burgoyne pursued and struck his rear division at Hubbardton and routed it and secured a large quantity of provisions. Schuyler, always wary, retired as Burgoyne advanced, obstructing his way and defeating his detachments. Burgoyne sent St. Leger with regulars and Indian allies to besiege Fort Schuyler. The patriot Gen. Herkimer, coming with relief for the garrison, was mortally wounded and his men repulsed, but Arnold's approach dispersed the Indian allies and St. Leger abandoned his effort.

Again Burgoyne detached Col. Baum with a few hundred men to gather supplies accumulated at Bennington. Gen. Stark, a New Hampshire brigadier, quickly gathered his brigade and volunteers 2000 strong. He gave battle near Bennington Aug. 16. Baum was defeated, as was also a reinforcement hastening to his support, 1500 in all. Stark's effort cost him 50 men, while Baum's dead alone were 207.

Battle of Bemis' Heights.—Gen. Schuyler had effected his purpose. Having depleted his enemy and organized against him more than 6000 men, he took position near the mouth of the Mohawk. Just then Gen. Gates, sent by Congress, replaced Schuyler. Arnold chose for him a good position at Bemis' Heights. Kosciuszko, the engineer, fortified it and the army took possession. Gates kept command of his centre and right near the Hudson River; the left was given to Arnold. Burgoyne still had about 7000 men; he assaulted with the usual three columns. The right one under Gen. Frazer sought a ravine on Arnold's left. Gen. Riedesel led a column on the other flank, while Burgoyne himself pushed forward the centre. Early on Sept. 19, 1777, the battle began, and raged for four hours. Gates had effectually stopped his enemy's advance, but yielded the field of battle, retiring a short distance without disorder. The British lost 600, Gates 321. Burgoyne waited for help from New York as long as he could, but receiving none he began, on Oct. 7, a tentative movement to cover a forage train, but so near Gates' camp that it brought on another battle, though not very decisive. The patriots lost 150, with Arnold among the wounded. The British lost between 500 and 600. Gen. Frazer was fatally injured. This is usually called the Battle of Saratoga. Retiring to Saratoga proper, Oct. 17, 1777, Burgoyne surrendered after his losses an aggregate of 5000 men. Gen. Clinton had sought to co-operate. He had attacked and captured Forts Montgomery and Clinton, and had foraged freely upon the country. After Burgoyne's discomfiture he burned Kingston and returned to New York. Ticonderoga and other Northern forts were at once abandoned by the British.

Battle of Germantown.—Gen. Washington left Pott's Grove and moved to Skippack Creek, 14 miles from Germantown. Gen. Howe had detached from this place quite a force to operate against the forts below Philadelphia, and another for supplies. Taking advantage of this, Washington decided to attack the remainder. A sharp engagement took place Oct. 4, but Howe, reinforced by Cornwallis, repulsed the attack. A heavy fog confused a well-planned effort, causing the loss of 1000 men. The British suffered a depletion of about half that number. Forts Mercer and Mifflin, on the Delaware, held by the patriots, were an annoyance to British transports. They were both attacked the same day, Oct. 22, 1777. Fort Mercer, on east bank, was assailed by 2000 men, Count Donop commanding, and Fort Mifflin, on an island, by the British vessels. Donop was mortally wounded, 500 soldiers disabled, and British ships dismantled. Another combined attempt began Nov. 10, using shore battery and war ships for five days. The garrison, driven out, fled to Fort Mercer, which itself was abandoned on approach of greatly increased British forces. Col. Samuel Smith led the heroic defence of Mifflin, Maj. Thayer replacing him when disabled by wounds. Col. Christopher Green, with 400 men, aided by Col. Hazelwood with two or three galleys, conducted the defence of Mercer.

Washington kept his army at Perkiomen Creek up to Oct. 30, when, reinforced by Varnum's Rhode Island brigade and perhaps 1000 besides, he again decided to give battle, advancing to White Marsh. Howe brought his army from Philadelphia to meet him, and after skirmishing for position from Nov. 5 to 8, made a precipitate retreat to Philadelphia. Soon

Washington's small army moved to Valley Forge for winter quarters.

Valley Forge has its own terrible history of privations and suffering, many officers leaving the service for want of pay. The patient commander held the remnant together in spite of rival malice. On the whole the patriot cause had gained during 1777. British sentiment was changing; the French acknowledged the new government, and was sending naval help under Admiral d'Estaing. Gen. Howe resigned, and Sir Henry Clinton took the chief command.

Fourth Campaign, 1778.

The British administration for a time seemed to weaken. During the spring and part of the summer Clinton planned merely to hold what he had. Foraging detachments from each army had bloody encounters at Quintin's Bridge, Hancock's Bridge, N. J., and at Crooked-Billet, Pa. Hearing of the movement of the French fleet, the British ministry feared that Clinton and his fleet might be shut in on the Delaware; so, under instructions, Clinton evacuated Philadelphia and returned to New York. This movement began June 18. Washington marched directly to intercept the British *en route*. He came so near to Clinton at Monmouth, N. J., that Clinton was forced to fight. Gen. Charles Lee, holding the advance and being already suspected of disaffection, ordered a retreat contrary to Washington's instructions. Being on hand, Washington prevented a disaster, but reprimanded Lee severely, who after that behaved well during the battle, and subsequently demanded redress. It resulted in his court-martial and dismissal. The battle of Monmouth was not decisive; but Clinton marched off before dawn the next day. In this retreat Clinton's total loss was 1500 men, and Washington's not to exceed 200. The former, on arrival at Sandy Hook, found Admiral Howe already there, and on July 3 he crossed his command in safety to Staten Island. Washington, on account of the great heat, halted for some time at Paramus, N. J. He then pushed up the Hudson and crossed, encamping again at White Plains: thus at will could he make junction with troops in the Highlands, support a projected eastern movement, or turn southward should Clinton's hostile plans so require.

The Rhode Island Operation.—Admiral d'Estaing at last arrived, but too late for co-operative moves on Philadelphia. Washington planned others against Gen. Pigot's command, then holding the island of Rhode Island and Newport. He was guarding a fortified depôt with eight or nine regiments and a naval squadron. Four or five Continental brigades gathered at Providence were soon reinforced by the brigades of Varnum and Glover. Gen. Sullivan was sent thither to command them. At Washington's solicitation d'Estaing left Sandy Hook and went to Sullivan's aid. He and the general agreed upon a combined assault of an island. Sullivan's militia not "coming to time," he asked of d'Estaing a postponement; after which, hearing that the island was vacated, he pushed over and took possession without consulting the admiral. D'Estaing was greatly offended, and instead of landing men as per agreement he dropped down where he could meet Lord Howe's fleet, reported to be coming from New York. A heavy storm forced both squadrons to sea and badly disabled them. Instead of returning after the storm, d'Estaing put into Boston for repairs. Gen. Sullivan was left to attempt alone what it plainly required a fleet to aid in doing. A battle at Quaker Hill was the result, in which Sullivan had the advantage: but hearing of Sir Henry Clinton's approach by shipping with large reinforcements, he hastened over the mainland and made good his retreat. The hard feelings that grew out of this affair caused great distress to Washington and Lafayette, and for a time injured the American cause.

Gen. Grey, a British officer, became as notorious as

did the Tory Gen. Tarleton, for merciless depredations and massacres, like that at Tappan, N. J.; but probably those massacres perpetrated by Tories and Indians combined, at Cherry Valley, N. Y., and at Wyoming, Pa., during July, 1778, exceed all others in enormity. Such fearful outrages overleaped their intent and reacted against the British.

Fifth Campaign, 1779.

Savannah.—Gen. Clinton planned to subjugate Georgia and the Carolinas. Tories in numbers had assembled in East Florida, Gen. Prevost commanding, and made predatory excursions into Georgia, keeping the country in alarm. To meet this, Gen. Robert Howe, Continental commander, with 500 men, moved over from Charleston to Savannah. He was soon joined by abundant volunteers and militia. An expedition toward Florida was organized and its execution was hopefully commenced, when it was broken up by the Governor of Georgia and other officers refusing to recognize Gen. Robert Howe's Continental commission. Hearing of this dissension Clinton dispatched Lieut.-Col. Campbell with 3500 soldiers and a naval accompaniment. Gen. Prevost was at the same time marching against Savannah from the south. Campbell arrived first, and on Dec. 29, 1778, gave battle. Robert Howe, receiving some accessions from Georgia and vicinity, made resistance; but the battle was of short duration. Howe escaped with a part of his command. The remainder were killed or taken prisoners, or perished in the swamps. Sunbury and Augusta were next taken, and soon Gen. Prevost held in subjection the whole of Georgia. He made one effort to make a permanent lodgment in South Carolina, but Gen. Lincoln, through Col. Moultrie using local militia at the battle of Beaufort, Feb. 3, 1779, thoroughly defeated him. The patriots under Col. Pickens, but 300 strong, had another success at Kettle Creek on Feb. 14, against Col. Boyd, who, with 700 men, was ravaging the neighborhood. Gen. Lincoln, thus encouraged, sent Gen. Ashe to recover Augusta, but Prevost surprised him at Briar Creek and nearly destroyed his command. Again Lincoln with 800 patriots, June 20, 1779, tried his fortune at Stono Ferry, where Maitland with a force of 1200 men was threatening Charleston. Lincoln was repulsed with considerable loss.

Admiral d'Estaing, returning from the West Indies with his fleet, joined Lincoln in an attempt to recover Savannah. After the failure of the assault, Oct. 9, 1779, d'Estaing left for France.

In December of 1778 Washington's army was occupying winter quarters. Gen. Putnam commanded a portion at Danbury, Conn.; Gen. McDougal detachments and forts in the Highlands, and a small army with head-quarters at Middlebrook, N. J. Early in 1779 Sir Henry Clinton undertook but little, except the sending from his own vicinity predatory and foraging expeditions; and therefore Washington continued mainly on the defensive. In July, however, he sent Wayne to recapture Stony Point, then garrisoned by 600 soldiers under Lieut.-Col. Johnson. Wayne attacked at midnight, his followers rushing in two columns from different sides without firing a shot till in possession. Wayne secured the entire garrison with a loss of but 98 men. It was denominated "the most brilliant assault known."

On Aug. 19 Major Harry Lee surprised Paulus Hook, near New York, and captured 150 of the garrison. Gen. Sullivan, during the same month, had extraordinary success in almost annihilating a force of Tories and Indians who were led by the fierce Gen. Brant in "the battle of Chemung."

The incipient patriot navy did something. Paul Jones gained historic renown, commanding a few American and French vessels, by boldly attacking two British frigates on the English coast. Both capitulated, September 23, at 10 P. M.

Sixth Campaign, 1780.

Thus far Sir Henry Clinton had almost undisputed success in the South. He naturally began operations there for 1780. With a good naval force, under Com. Arbuthnot, escorting 7500 troops of the line, Clinton appeared before Charleston about April 1 and commenced a siege. Gen. Lincoln, with some 600 patriots, made a prolonged defence. Col. Huger covered his communications at Monk's Corner with about 300 more. The terrible Gen. Tarleton, with 800 men, fell upon this guard April 14, dispersed it, and so held Lincoln's rear. At last, May 12, 1780, the gallant but unfortunate Lincoln surrendered his entire army.

Sir Henry followed up his victory by expeditions into the interior. Fort 96 was captured. Tarleton surprised Col. Buford's 300 Virginians at Waxhaw and "massacred or maimed every man." Now believing South Carolina subjugated, Clinton, leaving Cornwallis to replace him, returned to New York. The patriots Sumter and Marion were not yet conquered. They would suddenly gather their clans and clouds of battle would seem to burst from a clear sky. Rocky Mount was garrisoned by about 500 New York and South Carolina Tory volunteers, commanded by Lieut.-Col. Turnbull. Sumter, with 600 patriots, assaulted the works with impetuosity several times, but could not carry them; yet a little later, at Hanging Rock, he was victorious over Col. Brown and a similar garrison. Lord Cornwallis had come out as far as Camden, S. C., with 2200 men. Gen. Gates, replacing Lincoln, had gathered 3000 effectives. He and Cornwallis had both determined to attack at daylight, August 16, and each began a night march. They met about 2.30 A. M., skirmishing till dawn and then engaged. Gates was completely out-generalled and his army almost destroyed. Sumter, two days after, was surprised by Tarleton, and of his 700 followers only about 200 escaped death and capture. But already a change had come. One of the most active of the royal officers was Major Patrick Ferguson, 71st Regulars. He had with him at King's Mountain, N. C., 900 soldiers. The patriots of Virginia and North Carolina had run together, hoping to assist Gen. Gates; 1100 under Cols. William Campbell, Cleveland, and Williams had asked for a general officer, but Col. Campbell had charge till his arrival. On the morning of October 7 they rushed upon Ferguson's position, slew him, and completely routed his force.

Seventh Campaign, 1781.

Gen. Greene's Operations in the Carolinas.—Early in January, 1781, Gen. Greene, who relieved Gen. Gates of his command, arrived on the borders of North Carolina. He at once reorganized; the patriots flocked to his standard, and he began to control the partisan leaders. He first sent a detachment of 900 under Gen. Morgan into South Carolina to check depredations. The ubiquitous Tarleton overtook him at Cowpens, and the engagement was a sharp one, but resulted in a thorough victory for Morgan and a loss to Tarleton of over 800 men. To get clear of Cornwallis' pursuit, Morgan retreated till he had joined Gen. Greene in North Carolina. The celerity of Greene and heavy storms coming in quick succession kept Cornwallis at bay till the patriot army was sufficiently reinforced to risk a battle.

At Guilford Court-House Gen. Greene took position with about 4000 men. Cornwallis made an attack March 15, and finally, after a close contest, dislodged and defeated the patriots; yet he suffered so great a loss himself and was so far from his base, that he began to retreat on the 18th, and bore away towards Wilmington, N. C., leaving Lord Rawdon to command what he left behind in South Carolina, a field-force of about 1200. Taking advantage of the division of forces, Gen. Greene pushed off in the direction of Camden, S. C. On April 25 another battle, almost

a surprise to Greene, occurred at Hobkirk Hill. It was only a partial engagement, at the end of which Greene was compelled to retreat. There was but one more important engagement in South Carolina, and that was the well-known battle of Eutaw Springs, where Gen. Greene brought to bear 2000 patriots against 2800 British, mostly regulars, under Lieut.-Col. Stewart. This time Gen. Greene gained a signal victory. His own losses were heavy, but he inflicted a greater, and caused Stewart's rapid flight to Charleston.

Siege of Yorktown.—Arnold, after his attempt to betray and surrender West Point, had fled to the British and been made a brigadier-general in the English army. Before his desperate raid into Connecticut he was sent in charge of a predatory expedition up the Peninsula as far as Richmond, Va. Another British general, Phillips, was also moving to subjugate the belligerent Virginians. To form junction with these forces and keep open their communications with the sea, Lord Cornwallis marched from Wilmington into the lower counties of the State. Washington, knowing of the troubles there, had sent Gen. Lafayette with a small army to watch the raiders and do all that he could to hinder them. Early in May the French minister brought the welcome information that another French fleet, under the command of the Count de Grasse, bringing reinforcements, would soon arrive. A little later, Washington and the Count de Rochambeau, the field commander, met at Wethersfield and arranged for an allied and combined movement against the city of New York. But learning that de Grasse could not stay long, and that he was going directly to the Chesapeake, Washington at once changed his plan, resolving and arranging to move against Cornwallis in Virginia.

He executed this movement with wonderful caution: kept Sir Henry Clinton deceived as to his intentions till all his divisions except Gen. Heath's, which was left to threaten New York, were well across the Delaware and the French fleet between Yorktown and the sea blocking the way. Lord Cornwallis was already at Yorktown with his main body, where, in view of the threatening dangers, he was thoroughly fortifying both banks of the York River.

Washington speedily assembled his army at Williamsburg, and on Sept. 28, 1781, marched it to Yorktown and distributed his troops for a siege. The American forces, resting on the river below the town, deployed so as to occupy the right, the French so as to hold the left, the two meeting at a central morass. On the east, or Gloucester, side of the river, Sieur de Choisey, with a detachment, completed the land investment. Cornwallis had in the aggregate, besides his fleet, 7500 men. Washington, beyond his naval help, had gathered, including the French contingent, about 16,000. Sir Henry Clinton first endeavored to turn Washington back by diversions. He sent Arnold, recalled from Virginia, to lead a cruel expedition against New London, Conn. This failing, he encouraged Cornwallis with the hope of relief by raising the blockade and introducing troops and supplies. But at last, after a closer investment was effected and the impossibility of succor became evident, the proud Cornwallis, on Oct. 19, 1781, surrendered Yorktown and his entire army to Gen. Washington, and his shipping, with all the seamen, to the Count de Grasse.

Though the British held New York and other cities already in their possession till the establishment of peace, this surrender substantially closed the war. Negotiations were soon begun, a truce entered into, and a preliminary treaty effected and signed the 30th of November, 1782. The permanent treaty, with full specifications, was completed and signed at Paris, France, Sept. 3, 1783. (O. O. H.)

REYBAUD, MARIE ROCH LOUIS (1799-1879), French author, was born at Marseilles, Aug. 15, 1799. His father being a merchant destined him also for trade, and the son made several voyages to the Indies.

In his thirtieth year, however, he removed to Paris and began to contribute to the liberal journals. His satiric pen attacked the reign of the bourgeois under Louis Philippe. He was also director of the publication of the *Histoire Scientifique et Militaire de l'Expédition Française en Égypte* (10 vols. besides atlas, 1830-36), a work which Napoleon I. had caused to be prepared at enormous expense. Reybaud also edited the travels of Dumont d'Urville and d'Orbigny. In another direction he achieved success by his *Études sur les Réformateurs ou Socialistes Modernes* (2 vols., 1840-43), which obtained from the French Academy the Montyon prize. It discussed freely but fairly the socialistic schemes of St. Simon, Fourier, Robert Owen, and Cabet; but in later years the author expressed regret that he had not severely denounced "those destroyers of every social principle." In 1850, in consequence of this able work, Reybaud was elected to the Academy of Moral and Political Science. Another work in a lighter vein long retained its popularity. This was *Jérôme Puturot à la Recherche d'une Position Sociale* (1843), in which the manners of French society were held up to ridicule. A later volume of the same kind and partly the same name, but having reference to the Republic of 1848, did not meet the same success. Still Reybaud continued to work this vein for ten or twelve years. Reybaud had been a Liberal, but the revolution of 1848 made him a Conservative. In 1846 he had been elected to the Chamber of Deputies as the representative of Marseilles. He supported Louis Napoleon as president but refused to join in the *coup d'état* of 1851. In later years he contributed to various reviews and encyclopædias on industrial, economic, commercial, and marine topics. Among his works were *L'Industrie en Europe* (1856); *Économistes Modernes* (1862); *Mœurs et Portraits du Temps* (1864). Pres. Thiers in 1872 again called him into public service for a brief period. Reybaud died Oct. 28, 1879.

REYNOLDS, JOHN (1789-1865), governor of Illinois, was born in Montgomery co., Pa., Feb. 26, 1789, of Irish parents, who during his childhood removed to Kaskaskia, Ill. In 1812 he joined a company of scouts in the campaigns against the Indians. Settling at Cahokia, Ill., he became a lawyer, and in 1818 was made a justice of the Supreme Court of the State, then just admitted to the Union. He was elected to the Legislature in 1826 and served till 1830. During the Black Hawk war, in 1832, he had command of a volunteer company. He afterwards edited a daily paper at Belleville, served again in the Legislature 1846-48, and was speaker of the house 1852-54. He died at Belleville, May 8, 1865. He was a Democrat of strong opinions and strict integrity. He published a *Pioneer History of Illinois* (1848), and a bulky volume called *My Life and Times* (1855). This work, badly printed, had but little sale, and nearly every copy was destroyed in the great fire at Chicago in 1871, but its importance as a record of facts being recognized by the Chicago Historical Society, an improved edition was issued in 1883.

REYNOLDS, JOHN FULTON (1820-1863), general, was born at Lancaster, Pa., Sept. 20, 1820. He graduated at West Point in 1841 and entered the artillery. At the outbreak of the Mexican war he joined Gen. Taylor's army, and was distinguished at Monterey and Buena Vista, winning the brevets of captain and major. He afterwards served on the frontier until 1860, when he was appointed commandant of cadets at West Point. In May, 1861, he was made lieutenant-colonel of infantry, and in August brigadier-general of volunteers. He took command of a brigade of the Pennsylvania reserve corps, and led them in McClellan's Peninsular campaign in 1862 until he was taken prisoner at Glendale, June 30. He was exchanged in August, and commanded a division in Gen. Pope's campaign in Northern Virginia. When Lee invaded Maryland, Gov. Curtin, of Pennsylvania, selected Gen.

Reynolds to command the militia called out for defence of that State. He was soon after promoted major-general of volunteers, and the First corps of the Army of the Potomac was assigned to his command. He fought at Fredericksburg, Dec. 13, 1862, but at Chancellorsville his corps was held in reserve, though he requested to be sent to the front. When Lee invaded Pennsylvania in 1863, Reynolds, with the left wing of Meade's army, was hastening to overtake him. Encountering the van of the Confederate army at Gettysburg on July 1, he had already selected the ground for the impending battle, when at the opening of the fight he was killed by a rifle-shot, while cheering on his men. He was beloved by his soldiers and distinguished for ability as a general. A monument to his memory, designed by J. Q. A. Ward, is erected at Gettysburg; a bronze equestrian statue of him by Rogers stands in Philadelphia in front of the city hall.

RHETT, ROBERT BARNWELL (1800-1876), a noted secessionist, was born at Beaufort, S. C., Dec. 24, 1800. He was the son of James Smith, but in 1837 assumed the name Rhett from an ancestor. He was liberally educated and became a lawyer. In 1826 he was elected to the State Legislature, and in 1832 was made attorney-general. Throughout the nullification movement he was an advocate of the extreme view of States' rights. In 1838 he was elected to Congress and there maintained the same extreme position on every question affecting the South. After twelve years in the lower house he was sent to the Senate in 1850, where he openly advised a dissolution of the Union. When these views were disapproved by the people, he resigned from the Senate, but continued to urge the political doctrines of Calhoun in the *Charleston Mercury*, of which he was proprietor. In 1860 he took a prominent part in the State convention which passed the ordinance of secession. At the convention in Montgomery, Ala., he was chairman of the committee which reported the Constitution of the Confederate States. He was also a member of the Confederate Congress, and at the close of the war retired from public life. He died in St. James Parish, La., Sept. 14, 1876.

RHODE ISLAND. The smallest of the United States, it is also the most densely populated, and in the value per capita of its textile fabrics it exceeds every other. In inhabitants to the square mile only four countries of the world, viz., Belgium, British India, the Netherlands, and Great Britain, including Ireland, exceed it.

Population.—In the last census, taken in 1885, the population of the State was 304,284, an increase from 1880 of 27,888. The increase since 1885, judging by the best information that can be obtained, has been at a more rapid ratio. There has been a marked increase in the immigration of French Canadians, Swedes, and Italians.

Education and Illiteracy.—In 1887 the Legislature of the State enacted a law requiring, under a penalty not to exceed twenty dollars, that every person having under his control a child between the age of 7 and 15 shall annually cause such child to attend for at least 12 weeks, 6 at least of which shall be consecutive, some public day-school in the town or city where such child resides. To make this law effective, the same statute requires each town or city to appoint a special constable or truant officer who shall see that the law is complied with; it also requires each town and city to provide a suitable place for the confinement, discipline, and instruction of truants. The same statute forbids the employment of any child under 10 years of age "in any manufacturing, mechanical, or

mercantile establishment, or by any telegraph or telephone company," while the public schools are in session, and forbids that any child between 10 and 15 years of age shall be "so employed," except during the vacations of the schools, or under certain conditions which are minutely specified. Truant officers are also authorized to visit establishments where children are employed, and all owners, superintendents, or overseers of such establishments shall keep on file certificates duly authenticated and minutely specifying that said children have complied with the educational law. In spite, however, of these and all other provisions for the enforcement of the law, alien parents with children born before coming to the State are constantly violating it, through false statements respecting their children's ages. Illiteracy (meaning thereby inability to read and write) in the State, in 1880, was in the ratio of 11.2 to 100 of the whole population; in 1885 the percentage was 10.7. Under the operation of the compulsory law it is hoped and believed it will soon be still further reduced.

Cities.—The State now contains four incorporated cities—Woonsocket, with a population of between 16,000 and 17,000, having in 1888 been added to Providence, Newport, and Pawtucket.

Amendments to the Constitution.—Several of these have been made since 1885. According to a provision of the constitution itself, no amendment to it can be made which has not first been approved by a majority of the whole General Assembly (consisting of a House of Representatives and a Senate), and being submitted to a popular vote shall have been accepted by three-fifths of all the voters of the State. The first of the amendments referred to was made in 1886, prohibiting the manufacture and sale of intoxicating liquors to be used as a beverage. In the May session of the same year the General Assembly (which holds two sessions a year, the first in May, at Newport; the second beginning in January, at Providence), passed a long series of enactments for the enforcement of prohibition. Some of the enactments, and especially some of the officials appointed to carry the enactments into execution, gave great offence to large numbers of citizens of both political parties. The enactments and appointments known as the "May deal" resulted at the next State election in a complete overthrow of the Republican party, under whose administration the "deal" took place. The practical result was, that the prohibitory law became a dead letter, and intoxicating liquors were for sale openly and anywhere. During the present year, 1889, the Republicans are again in power, and the office of attorney-general is filled by an officer who is prosecuting offenders against the law with a vigor and determination that bids fair to secure for it some show of respect.

At the May session of the Legislature in 1888 an amendment was submitted to the people extending the suffrage to all soldiers and sailors of foreign birth from Rhode Island who served in the army or navy of the United States during the late civil war, and, receiving the requisite three-fifths of all the votes cast, it became a part of the Constitution.

A proposed amendment in 1887, extending the suffrage to women, was submitted to the electors, but failed to receive the required three-fifths of the votes polled.

At the January, 1888, session of the General Assembly an amendment was approved and submitted to the electors, extending the suffrage to every male citizen of the United States who had for two years been a resident of the State and for six months a resident in the town or city in which he may offer to vote, and who has been duly registered; provided, however, that he shall not be allowed to vote in the election of the city council of any city, or for the imposition of any tax, or for the expenditure of any money, unless he shall during the immediately preceding year have paid a tax on property assessed at a valuation of not less than

\$134. The assessors of each town or city shall impose on each registered voter a tax of one dollar, "or such sum as with his other taxes shall amount to one dollar," and said tax shall be paid into the public treasury for the support of public schools, the General Assembly, however, retaining to itself the right to prescribe by law for the remission of this tax under given conditions. This amendment received the required three-fifths vote at the general State elections in April, 1888.

Industrial Progress.—No satisfactory information on this point is at present obtainable. The discrepancies between the State census of 1880 and that of 1885 are so great and of such kind as to show that neither one of them can be relied on for exact information. For example, in 1880 the capital invested in cotton manufacture was said to be \$29,260,734, and in 1885 it was \$21,154,255, whereas it is well known that there has been a large increase in the capital so invested. In woollen manufactures the capital invested was reported in 1880 as \$13,016,116, and in 1885 as \$8,568,450, whereas there are good reasons for believing that there could have been only a fractional difference, if any, in the two periods. In 1880 the total value of the products of the State was put at \$108,714,671, and in 1885 at \$104,269,773; the product to each person being in the first \$393.14, and in the second \$342.67. And so on throughout the two censuses. The only explanation given of these differences is, that in 1880 the estimates of value were made by the census-takers, and in 1885 the estimates given were those of the manufacturers themselves. It is the estimate of good judges that the annual increase in the value of the products for the past few years has not been less than five per cent. and probably has been more. (E. G. R.)

RHODODENDRON, a genus of shrubs or small trees of the *Ericaceae*, or heath family, which, including the *Azaleas*, comprises the handsomest and most showy flowering shrubs of both hemispheres. The species of the genus are widely distributed, America possessing several, the blossoms of some of which are unsurpassed for beauty among our wild flowers. These are locally known as Rosebay trees, but more generally by their scientific title of *Rhododendron* (Greek, *rhodon*, rose; *dendron*, tree; from the rose-colored flowers of many plants of the genus). *R. maximum*, the common American species, is an arborescent plant, bearing pale-red, funnel-shaped, wide-mouthed flowers in umbellate corymbs, studded with green, yellow, or purple protuberances, the leaves of elongated oval

Rhododendron.

form, smooth, and of thick coriaceous texture, their length being 5 or 6 ins. The plant varies from about 10 ft. to 20 or 25 ft. in extreme height, and 4 or 5 ins. diameter. It is an evergreen, renewing its leaves every 3 or 4 years, and flowering from June to

August. The flowers, though ordinarily rose-colored, are sometimes pure white, and always occur at the extremities of the branches in beautiful groups which derive an added charm from the luxuriant foliage which surrounds them. The seeds are exceedingly minute, and are contained in capsules which open in autumn for their escape. This species occurs sparingly from Long Island northward along the Hudson to the Highlands, but is rarely found as far north as Massachusetts. It is very common in the mountain districts of the Middle and Southern States, particularly those of Georgia and the Carolinas, and is found almost exclusively on the borders of streams, growing so abundantly on the sides of the mountain torrents of the Alleghenies as sometimes to form impenetrable thickets. It prefers deeply shaded situations, near cool waters, where the atmosphere is full of moisture. The wood is hard, compact, and fine-grained, but too small to be of much use in the arts, and the almost entire use of the Rhododendron is as an ornamental plant. A variety of the species, *R. m. purpureum*, the purple-flowered rosebay tree, a native of Virginia and the Carolinas, bears large purple flowers, and grows to a height of 25 ft., with a stem occasionally as much as 18 ins. diameter.

A second important American species, *R. Catawbiense*, is a shrub from 3 to 6 ft. high, its flowers broadly bell-shaped, and of lilac-purple hue. It is found on the higher Alleghenies from Virginia to Georgia. Of species of less importance may be named *R. Lapponicum*, the Lapland Rhododendron, a dwarf species belonging to the Arctic flora of both continents; *R. punctatum*, a small species with rose-colored flowers, on the mountains of North Carolina and southward; and *R. albiflorum*, a Rocky Mountain species, with drooping, cream-colored flowers. *R. Californicum* is a plant of moderate size with very showy rose-colored flowers.

The Rhododendrons have for many years been cultivated as garden flowers, particularly in England and Europe, very many highly beautiful varieties having been produced. No other shrubs equal them for beauty of form and foliage and profusion and variety of flowers, while they are very manageable and not easily injured. Their cultivation in this country is rapidly on the increase, the principal incentive to it having been a magnificent English display made at the Philadelphia Centennial Exhibition. *R. Ponticum*, an Asiatic species, is the basis of most of the cultivated varieties, but it and other delicate Eastern species have been largely hybridized with the hardy *R. Catawbiense*, greatly to their improvement in beauty and vigor. From this hybridization has arisen most of the fine ornamental forms now so extensively cultivated. *R. Maximum* has proved less adapted to the production of useful hybrids.

The leaves of some species of Rhododendron are said to be poisonous to cattle, yet they have been used in moderate doses as remedies for rheumatism. This poisonous quality is said to pertain to the nectar of the flowers of *R. Ponticum*. In India the natives eat the flowers of *R. arboreum*, and the English prepare a conserve from them. The leaves of *R. campanulatum* are powdered and used as snuff by the natives. Some American Indians are said to employ the dust which adheres to the petioles of Kalmias and Rhododendrons for a similar purpose. (C. M.)

RHUBARB. The root and leaf stalk of several species of the genus *Rheum*, order See Vol. XX. *Polygonaceæ*, the root being used as a valuable medicine, and the leaf stalk as an article of food. All the species of *Rheum* have purgative and astringent properties, this being particularly the case with the roots. It is not certain which species yield the commercial rhubarb, as they grow in regions of Thibet or Western China which have not been explored by naturalists. It has been known as a drug from a remote period,

being long brought to the ports of the Levant, and thence shipped, whence the name of Turkish Rhubarb was given to the best qualities. It is now shipped directly from China. Rhubarb has a peculiar smell, and a disagreeable, bitter, astringent taste. In small doses it acts as a stomach-bitter, but in large ones as an active purgative. Numerous pharmaceutical preparations of it are in use.

Several species, including *R. Rapaonticum*, *R. Tartaricum*, *R. undulatum*, and others, all of Asiatic origin, are now largely cultivated for culinary purposes, their acidulous leaf stalks and unexpanded flower mass being largely used under the common name of Pie Plant. These stalks are from 1 to 3 ft. long and 2 to 3 ins. in diameter in their widest part, of a pale-green color often tinged with red, and are very succulent, with a pleasantly acid taste. They are used as a substitute for fruit in pies, tarts, etc., while the expressed juice forms a palatable wine. Rhubarb has been used for this purpose only since 1800. It is now largely raised by market gardeners, the annual crop being very considerable. It succeeds best in deep and somewhat retentive soil, the richer its condition and the deeper worked the better. It may be propagated by seeds or by division of the roots, the latter being the usual method. It is not usually plucked till the third year, but a plantation not too greatly cut will bear from ten to fifteen years. It lends itself well to the forcing process, and this is practised extensively by gardeners for early supply of the market. (C. M.)

RIBBECK, JOHANN KARL OTTO, a German philologist, was born July 23, 1827, at Erfurt. He was educated at Breslau, Berlin, and Bonn, enjoying at the last the instruction of F. W. Ritschl, with whom he held a life-long intimacy. In 1852 he visited Italy and was afterwards engaged in teaching at Berlin and Elberfeld. In 1856 he was made professor extraordinary in the University of Berne, and in 1859 was advanced to a full professorship, with the direction of a philological seminary which he had himself founded. In 1862 he was made professor in the University at Kiel, in 1872 at Heidelberg, and in 1877 succeeded Ritschl at Leipsic. Ribbeck's chief works are *Scenice Romanorum poesis Fragmenta* (2 vols., 1852-53); *Die Römische Tragödie im Zeitalter der Republik* (1875); his critical edition of Virgil with its *Appendix* (5 vols., 1859-68), his labors on Juvenal and Horace. He also published a memoir of his friend Ritschl (2 vols., 1879-81).

RICASOLI, BARON BETTINO (1809-1880), an Italian statesman, was born at Florence, March 9, 1809. In March, 1847, with some companions he addressed two memorials to the Tuscan government demanding a constitution and a free press. During the revolution following, Ricasoli established *La Patria*. He was then chosen *gonfaloniere* or mayor of Florence, and in the next year entered the Tuscan Parliament. After the battle of Novara he favored the recall of the Grand Duke in the hope of effectual resistance to the Austrian domination. But he was disappointed, and soon abandoning political activity he devoted his energy to the improvement of a newly purchased estate in the Maremma. He was induced some years later to place himself at the head of the National party, and was the chief founder of the *Biblioteca civile dell'Italiano*. In 1859 the Grand Duke fled and Ricasoli, who was minister of the interior in the provisional government, contributed essentially to effect the union with Sardinia, which was formally declared March 22, 1860. He was then appointed governor-general of Tuscany and was also elected to the enlarged Sardinian Parliament and to the first Italian Parliament, which met in February, 1861. After the death of Cavour in June he formed a new ministry, taking for himself the department of foreign affairs. Though he was faithful to Cavour's policy he could not command his followers and in March, 1862, he retired. He was still the representa-

tive of Florence in the Parliament, and in 1866 he was again premier and minister of the interior, though only for ten months. He died in his castle Brolio near Sienna, Oct. 23, 1880.

RICE is the common name of *Oryza sativa*, a plant of the order Gramineae or grasses, the seed of which is more widely used as an article of nutriment than that of any other cereal. The plant has been known and cultivated for ages, particularly in Eastern Asia. Its generic title, *Oryza*, used by Theophrastus, and the Arabic *aruz* are not far from the modern European *riz*, *reis*, or *rice*. The rice plant is an annual, with a stem from one to six feet high, its leaves lanceolate, and flowers borne in a terminal panicle. In Asia two distinct species of *Oryza* are cultivated, the lowland and the upland rice, of which the latter rots if inundated and perishes in sea water. The lowland rice, which is the species cultivated throughout the world, bears more extensive inundation than almost any other food plant, though it can be grown without inundation, and is the basis of both the lowland and upland rice of the United States. The rice plant furnishes more food to mankind than any other grain, as it constitutes the principal food supply of the teeming millions of India and China, while largely used in other parts of the world. It is the grain of the intertropical regions, as wheat is of the temperate and oats and rye of the more northerly latitudes. It is produced in immense quantities in most countries of Eastern Asia, in some of the southern countries of Europe, in parts of the West Indies, Central America, and the United States, and supplies perhaps one-third of the human race with its main article of food. Fifty or more varieties of the plant are cultivated in different countries, the principal differences being in the size, shape, and color of the grain, but these practically resolve themselves into lowland or aquatic rice and upland or mountain rice. As regards the extent and methods of the cultivation of rice in Japan, China, and India, see U. S. *Consular Reports*, No. 96, August, 1888.

As an article of nutriment rice falls below wheat, containing less than half the amount of the gluten. It has one-fourth more starch, however, and this, with its cheapness and large yield, renders it a preferable basis for starch manufacture.

The culture of rice in the United States began in 1694, in which year a vessel from Madagascar, which put into Charleston in distress, had on board a small sack of rice, which was given to the authorities of the city, and was at once tried in garden culture. It yielded abundantly, and the seeds were distributed to planters, which process was continued until it became the staple commodity of the colony. From South Carolina its culture extended through other Southern States, it being now raised extensively in Georgia and Louisiana. It possessed the advantage that it could be profitably grown on land too low and moist for other useful plants, and that its culture required less labor than the other grains. The swamp lands along the South Carolina coast proved well adapted for its culture, and yielded excellent returns, but are now replaced in considerable part by the irrigation of tide lands, which present decided advantages in the culture. American rice has long borne a high reputation for its excellence, its quality being far beyond that of any other locality. This is perhaps partly due to favoring conditions of soil, but largely to care in cultivation, the grain being much sweeter, larger, and better colored than that from Asia, the Bengal rice most nearly approaching it.

The culture of rice in Louisiana was begun in 1718, by Law's French "Company of the West." Recently its production there has greatly increased, the levees along the Mississippi being opened by permission for irrigation of the fields in the adjoining alluvial bottoms. The principal expense there is the ditching and other-

wise preparing the land for irrigation, the seeding and cultivation being comparatively inexpensive. The process pursued is briefly as follows: The sowing being completed, the river water is let on profusely, and kept so until the growing plant appears above its surface. Then the field is drained, and kept dry until the stem begins to form joints, when it is flooded again and left so for about six weeks, till the grain is mature. During this period it is simply necessary to see that the water is kept fresh, and to pull up such weeds as the water fails to kill. Maturity is indicated by the grain turning yellow. The field is then drained, the grain cut, threshed, and winnowed, and sacked for mill or market. An expensive process, however, is necessary to get rid of the inner hull of the rice grain, which it holds more tenaciously than wheat. Special machines are needed for this purpose, in which the grain is so broken that after milling little more than half remains prime rice, the remainder being partly broken rice, partly flour. The upland rice yields a smaller grain than the lowland, though with the advantage of being harder and drier. It is cultivated much like the other small grains, the crops being remunerative, though smaller than that of lowland rice. One disadvantage of the rice culture on the Atlantic is that it proves very detrimental to the health of white men, from the dangerous malarial exhalations from the irrigated soil. The negroes, however, are rarely affected by malaria. The Louisiana culture seems no more injurious to health than in the case of any other crop raised there.

The rice crop of the United States has suffered considerable fluctuations during the several recent decades, as appears by the following statement:

Year.	Crop.
1840.....	80,841,422 pounds.
1850.....	215,312,710 "
1860.....	187,140,173 "
1870.....	73,635,021 "
1880.....	110,131,373 "

The decrease in production is made up by a very considerable importation. During this period the production of South Carolina has decreased, and that of other States advanced, that State producing, in 1850, 159,930,613 lbs., and in 1880, 52,077,515 lbs., while Georgia and Louisiana have correspondingly increased. At present rice is cultivated from near the Southern Virginia line to Texas, and well back from the coast lands into the upper country. In 1880, according to the census reports, 174,173 acres were under cultivation for rice, with the following yield in the four principal States:

	Acres.	Product.
South Carolina.....	78,388	52,077,515 pounds.
Georgia.....	34,973	25,369,687 "
Louisiana.....	42,000	23,188,311 "
North Carolina.....	10,846	5,609,191 "

In Asia rice is used to a considerable extent in the making of intoxicating drinks, a rice beer or "sake," being extensively used in Japan, while a strong spirit, called "arrack," is distilled from rice and molasses, and used throughout the East Indies. Rice sugar yields in Japan a kind of confectionery called "ame." Enormous quantities of rice are now consumed in the manufacture of starch particularly in Great Britain. (C. M.)

RICE, LUTHER (1783-1836), the organizer of American Baptist missions, was born at Northborough, Mass., March 25, 1783. After graduating at Williams College in 1810, he entered Andover Theological Seminary, and there joined in the movement already begun by Samuel J. Mills in advocacy of missions to the heathen. He was ordained with Judson, Newell, and two others at Salem, in February, 1812, and sailed to India. But on the voyage, from fresh study of the New Testament, he adopted Baptist views and was baptized soon after his arrival in Cal-

cutta. As Judson, who had sailed in another vessel, had experienced a similar change of views, it was arranged that he should stay for mission labor in India, while Rice returned to seek support for the work from the Baptist denomination. His return excited a sensation among religious people, and at the General Convention in 1814 a Baptist Missionary Society was formed, of which Rice was made the agent to visit the American churches. After several years thus spent, Rice projected the Columbian College at Washington, and devoted himself to similar labors in its behalf. He died in Edgefield, S. C., Oct. 25, 1836.

RICE, NATHAN LEWIS (1807-1877), Presbyterian theologian, was born in Garrard co., Ky., Dec. 29, 1807. He graduated at Centre College, Danville, and was ordained pastor of a Presbyterian church at Bardonia, Ky., in 1833. He was pastor in Cincinnati from 1844 to 1853, and during this time conducted public controversies with Rev. Alex. Campbell on baptism, with Bishop Purcell on Roman Catholicism, and with others. In 1853 he removed to St. Louis, and in 1858 to Chicago, where he became professor in the Theological Seminary of the North-west. In 1868 he was made president of Westminster College, Mo., and afterwards became professor in the Danville Theological Seminary. He died at Danville, June 11, 1877. He was an able preacher and conservative theologian. His writings were chiefly controversial.

RICHARDS, WILLIAM (1792-1847), missionary, was born at Plainfield, Mass., Aug. 22, 1792. He graduated at Williams College in 1819, studied theology and was sent by the American Board of Commissioners for Foreign Missions to the Sandwich Islands in 1822. There he gave instruction to the royal family, and in 1838 was made counsellor and chaplain to King Kamehameha III. After the Sandwich Islands were recognized as an independent nation by England and other powers, Richards was sent on an embassy to them. In 1845 he was appointed minister of public instruction. He died at Honolulu, Dec. 7, 1847.

RICHARDSON, BENJAMIN WARD, English physician, was born at Somerly, Leicestershire, Oct. 31, 1828. He was educated at Glasgow and graduated in medicine at the University of St. Andrew's in 1854, gaining there a gold medal for an essay on ante-natal diseases. In 1856 he won the Astley Cooper prize for an essay on coagulation of the blood. He then became a member of the Royal College of Physicians and was elected a fellow of the college in 1867 and Croonian lecturer in 1873. He has made special experiments in regard to the poison of contagious diseases, anaesthetics, restoration to life after apparent death, methods of killing without pain animals intended for food. His best known researches, however, have been in regard to the action of alcohol on man. He has received many marks of honor from learned and scientific societies and colleges, including the degree of LL. D. from St. Andrew's University in 1877. His medical brethren presented him in 1868 with a microscope and 1000 guineas in recognition of his contributions to science and medicine.

RICHARDSON, CHARLES (1775-1865), English lexicographer, was born in July, 1775. He studied law but devoted himself to literature. After publishing *Illustrations of English Philology* (1815) he undertook to prepare for the *Encyclopædia Metropolitana* articles on lexicography. These served as an introduction to his *Dictionary of the English Language* (2 vols., 1837), whose peculiarity is that derivative words are classified under their primitives and abundantly illustrated by quotations. The *Dictionary* proved popular, passed through several editions in England and was reprinted in the United States. Richardson continued his philological labors, publishing a *Supplement* (1855), a *Historical Essay in English Grammar* (1845), and a work on *The Study of Languages* (1854). He also published some comments on Shakespeare and contrib-

uted to various literary periodicals. He died at Feltham, Middlesex, Oct. 6, 1865.

RICHARDSON, HENRY HOBSON (1838-1886), architect, was born at Priestley's Point, La., Sept. 29, 1838. His father was a planter of Scotch descent and his mother a daughter of Dr. Joseph Priestley (for whom see *ENCYCLOPÆDIA BRITANNICA*). After graduating at Harvard in 1859, Richardson went to Paris to study architecture. The loss of his property through the civil war compelled him also to exert himself for his own support. Returning to the United States in 1865, he engaged at once in his chosen pursuit and formed a partnership in New York city. The city of Springfield, Mass., was the first field for the display of his powers; there he erected railroad offices, a bank and a church, which gave promise of better work to come. In 1871 his Brattle Street Church, Boston, first strikingly exhibited his originality of design and marked an advance toward his grander Trinity Church in the Back Bay section of the same city. The leading idea of this building, the tower which dominates both its exterior and interior, was derived from the churches of Auvergne. To the decoration of the interior the artist La Farge contributed excellent work. During the erection of this church Richardson removed to Brookline near Boston, and his reputation being firmly established was thenceforth busily occupied with structures for every variety of purpose, warehouses, dwellings, libraries, churches, college and public buildings. All his works are marked by a grand simplicity of design and produce their impressive effect by massiveness rather than elaborate detail. Richardson's artistic sense was not satisfied until he gave each building an individuality characteristic of its intended object. The grand solidity and broad unity of his works set them widely apart from older American architecture. Soon a number of younger architects took him as their master and inspirer, and in all parts of the country his influence is manifest in the new edifices. The State Capitol at Albany, commenced by others, called forth his labor and skill. At the time of his death he was engaged on two important buildings, one for the Board of Trade at Cincinnati, the other the county court-house at Pittsburg. Yet amid his abundant work he had a prolonged struggle with ill health. He died at Brookline, April 28, 1886. For a fuller account of the genius which in a brief life did much for American architecture see Mrs. Schuyler Van Rensselaer's *Life and Works of H. H. Richardson* (1888).

RICHMOND, a city of Indiana, the county-seat of Wayne co., is on the East Fork of Whitewater River, 70 miles N. N. W. of Cincinnati, at the intersection of several railroads. It has a court-house, 3 national banks, 15 churches, a high-school and other schools, a public library, 4 daily and 4 weekly newspapers. Richmond is a settlement of the Society of Friends, whose Indiana Yearly Meeting is held here. Earlham College, founded by them in 1859, is open to pupils of either sex. Richmond has manufactures of agricultural implements, steam-engines, boilers, flour, etc. In 1880 it had a population of 12,742.

RICHMOND, the capital of Virginia, and county-seat of Henrico co., is on the N. bank of the James River, at the head of tide water, 37° 32' N. lat., 77° 28' W. long. Vessels drawing 14 feet of water can come up to Rocketts, at the lower end of the city.

Bridges connect Richmond with Manchester on the south side of the James and with Belle Isle. Richmond is 100 miles nearly due south from Washington, but 116 miles by rail. It is built on a group of hills; the historic capitol, erected in 1796, and noted for its monuments, archives, and portraits, occupies the summit of Shockoe Hill. Other public buildings are the custom-house, governor's mansion, State penitentiary, post-office, city-hall, almshouse, and market-houses. There are 4 national and 8 other banks, 60 churches,

orphan asylums, and church homes. Besides the public schools, there are several educational institutions, among them Richmond College and Virginia Medical College. The falls of the James River furnish immense water-power which is abundantly utilized. There are over 600 manufacturing establishments, including iron-works, flour-mills, paper-mills, fertilizer-works, and tobacco-factories. The Tredegar iron-works are the largest and were of historic note in the civil war. The formerly extensive trade of the city was interrupted and dispersed by the war, but it has since revived and is facilitated by flour, tobacco, and other exchanges. Besides its railroad connections with North, South, and South-west, Richmond has regular lines of steamers to New York, Philadelphia, and Baltimore. Richmond was founded in 1737 by Col. William Byrd. It was incorporated in 1742, and was made the capital of Virginia in 1779. It became a political and commercial centre for the Southern States. When Virginia passed its ordinance of secession in May, 1861, the capital of the Confederate States was fixed at Richmond, which thus became the objective point of the principal military operations of the Union army in the East. It was however strongly fortified with earth-works and bravely defended, so that it resisted the various attacks until April, 1865, when it was evacuated and partly destroyed by the Confederates. For Gen. McClellan's expedition against it in 1862, see PENINSULAR CAMPAIGN, and for Gen. Grant's operations, 1864-5, see the following article.

RICHMOND, GRANT'S SIEGE OF. For the preliminaries of the series of military events in the American civil war comprised under this title, the reader is referred to the articles WILDERNESS CAMPAIGN and COLD HARBOR, which detail the preceding events from the time that Gen. Grant took command of the Army of the Potomac. In the spring of 1864 Gen. B. F. Butler moved up the James River, at the same time that Grant crossed the Rapidan. On May 6 he landed at City Point and Bermuda Hundred, and sent a force to capture Petersburg, but this was turned back by a report that that town was strongly defended. Earthworks were then thrown up at Bermuda Hundred, extending from the James to the Appomattox, a distance of 3 miles. Some fighting took place subsequently, and Butler felt himself obliged to remain in his intrenchments until called to reinforce Grant on his approach to Richmond.

After the battle of Cold Harbor, June 3, 1864, Grant having failed in his effort to capture or disperse Lee's army, and lost very heavily in doing so, decided to replace battle by siege, and to endeavor to wear out that army which he had not succeeded in vanquishing. His new plan was to transfer his army to the south side of the James, and to endeavor to compel the surrender of Lee's army by cutting off its communications, if it could not be vanquished by direct assault. This purpose was skilfully concealed, and Grant was already crossing the river while Lee was awaiting attack within the fortifications of Richmond. On the night of June 14 a pontoon bridge was thrown across the James, over which the whole army had crossed by noon of the 16th. White House, on the Pamunkey, was abandoned as a base of supplies, and replaced by City Point, on the James River, then defended by Butler's works at Bermuda Hundred.

The capture of Petersburg was an important part of Grant's design, as the possession of that city would give him immediate control of two of the railroads leading to Richmond. Butler endeavored to take it by a combined infantry and cavalry attack on June 10, but Gillmore, who was at the head of the infantry, halted when in front of the works, and fell back under the impression that his force was too weak to take them. Kautz, with the cavalry, meanwhile dashed into the town, but was driven back by its defenders, whom Gillmore's retreat had left free to act against him. Thus, by lack of proper co-operation, this prom-

ising effort failed. It was renewed five days afterward. By Grant's order Gen. W. F. Smith and his command crossed the Appomattox to co-operate with Gillmore and Kautz in a second attack on Petersburg. There was good reason to expect success from this movement, but it failed like the former, and from the same lack of activity and vigor. The troops marched in three columns, Kautz on the left, Brooks in the centre, and Martindale on the right. A negro brigade under Gen. Hinks captured some advanced rifle-pits, and the troops moved forward with assurance of success, until checked by a strong line of works in their front, apparently well defended.

Despite the formidable show of these works their defenders were really very few, and a vigorous push would probably have carried them without difficulty, but Smith paused and prepared so carefully for the assault that it was near sunset before he was ready. Meanwhile Lee's army was rapidly crossing the James, and troops were streaming down towards Petersburg. The assault took place at 7 P.M. A part of the force pushed the enemy from their line of rifle-pits, and soon had possession of the entrenchments for a length of 2½ miles, having taken 15 guns and 300 prisoners. Two divisions of Hancock's corps had now come up and joined Smith's command, when the latter ordered a halt. He deemed it wiser to hold what he had than to lose all by attempting more. Yet as Grant afterwards said, Petersburg was, at that moment, at his mercy, there being no other works and no troops of importance. By morning, however, the situation had decidedly changed. The city was then full of Lee's veterans, a new line of works had risen as if by magic, and the coveted prize was lost. The important point, which might have been taken that night in an hour or two, was destined to defy its foes during a siege of ten months' duration, in great part devoted to the capture of the two railroads which ran through the city of Petersburg.

Both armies now being south of the James, and once more confronting each other, a bombardment of the Confederate lines began, which was kept up during the whole night of the 16th. The Union lines made a general advance, and captured some important positions, though at severe loss. The battle continued throughout the 17th, the Confederates regaining some points, but failing to retake others. On the 18th an advance in force on the Petersburg works was ordered, Grant believing that only a portion of Lee's army was yet upon his front. But morning revealed the fact that the Confederates had abandoned their weakened line and retired to a stronger position on an inner line, defended by strongly constructed works. This change delayed the attack till afternoon, and then it only brought disaster to the assailants, who were repulsed at every point. In these three days of battle nearly 10,000 men had been lost, and nothing of correlative importance had been gained. It was evident now that Lee's army was fully before him, and Grant prepared for a siege of the works which he had failed to take by storm.

The next day or two were spent by both armies in intrenching, the beginning being made of those formidable works which for months defied capture from either side. At the same time the Union left was extended towards the Petersburg and Weldon Railroad, being the preliminary step towards breaking Lee's communications with the south. On the 21st the Second and Sixth corps were put in motion towards the left, but on the following morning a division of the Confederate Gen. A. P. Hill's corps projected itself between the two commands, struck Birney's divisions heavily on the flank, and drove them back with heavy loss. A similar attack was made on Wright's corps. They soon reformed, and by order of Meade advanced and retook their ground, Hill retiring with 2500 prisoners, the fruits of his impetuous assault. The advance was resumed the next morning, and the Weldon road

reached, but while the regiments in the van were engaged in tearing up the track, a sudden attack from a part of Hill's corps drove them back, many of them being taken prisoners. The railroad had been reached but had not been held, while the army had suffered a loss of nearly 4000 men, mostly prisoners.

At the same time a cavalry expedition, 8000 strong, was sent for the purpose of breaking up the railroads leading southward. They did considerable destruction to the roads, tearing the rails up for miles, but on their return found the country full of enemies, and had to fight their way back. Reaching Reams' Station on the Weldon road, which they expected to find in the hands of friends, they discovered it to be occupied by a strong force of Confederate cavalry and infantry, and were defeated with heavy loss in attempting to break through this line. They finally reached the army, but had been so severely handled that no similar raid was attempted for months. The profit proved too little for the peril and expense.

This southward movement was followed by a similar one on the north, Butler, on July 10, throwing a brigade across the James River at Deep Bottom, where an intrenched camp was formed. This post was connected with the army at Bermuda Hundred by a pontoon bridge, and was of advantage in enabling Grant to throw heavy masses to the north of the James, if desirable. Lee laid a similar bridge across the river at Drewry's Bluff, by which counter motions could be made.

And now the use of musket and cannon, and destruction of hosts of men, which had continued almost uninterruptedly for nearly two months, was replaced by the use of the pick and shovel. Several months more were busily employed in erecting those long and formidable lines of earthworks which eventually extended for nearly 40 miles, from the left bank of the Appomattox around the western side of Petersburg, to and across the James and to the north-eastern side of Richmond. They consisted of a double series of redans, redoubts, and infantry parapets, with other defences of abatis, stakes, and chevaux-de-frise, facing each other, well mounted with guns, and manned by the tried armies which for years had confronted each other on the soil of Virginia. The war had taken on a distinctly new aspect, and the engineer for the time being had replaced the field-officer in the conduct of operations.

The monotony of engineering operations was broken by brisk field-work at the north. Sheridan early in June was sent with a large cavalry force to break up the Central Railroad and cut the Kanawha Canal, channels of supply to Richmond. He found himself, however, confronted by Wade Hampton with a strong body of cavalry, and after a spirited engagement rejoined the army without having accomplished his chief purpose. On the other hand, Lee, with the hope of creating a diversion in his favor, sent, on June 13, Gen. J. A. Early with a force variously estimated at from 8000 to 15,000 men up the Shenandoah Valley, to threaten Washington and alarm the Federal authorities. Hunter, who had been advancing on Lynchburg, was forced to retreat across the mountains to West Virginia, and Early, by a rapid march, reached and crossed the Potomac without opposition on July 5, defeated Gen. Wallace at the Monocacy on the 9th, and on the 11th appeared before Washington, his approach being heralded by wild reports of the magnitude of the force under his command.

Had Early been a day sooner he might have entered and captured the city with little difficulty, but the delay occasioned by Wallace's defeat at the Monocacy saved the Federal capital. The troops ordered to its defence reached there on the 11th, and when Early, on the morning of the 12th, prepared to attack, he found the intrenchments full of men. He at once began to retreat, and made his way with all haste back to the Valley. His subsequent career may be

quickly disposed of. On the 23d he defeated Gen. Crook at Kernstown. Crossing the Potomac again, he sent a cavalry force into Pennsylvania, which occupied and burned the defenceless town of Chambersburg. Sheridan was now placed in command in the Valley, and defeated Early in the successive battles of Winchester and Fisher's Hill. On October 19 Early surprised the Union force in camp at Cedar Creek, and drove it back in great confusion towards Winchester. Sheridan, who had been absent at Washington, was on his way to the army from Winchester while the battle was going on, and heard in the distance the roar of the cannon. Then took place the remarkable incident of his dashing ride to the front, his rallying of the fugitives by the magnetism of his presence, and his turning of the tide of flight into an irresistible charge on the hitherto victorious enemy. Early's force was defeated and almost destroyed, only a small remnant of the army escaping. This ended the conflict in the Shenandoah Valley. Lee's diversion had signally failed.

Returning to the siege of Petersburg, the next occurrence of notable interest was the mine explosion of July 30. This attempt to mine the Confederate works was originally proposed by Lieut.-Col. Henry Pleasants, of the Forty-eighth Pennsylvania, a skilful mining engineer. The mining operations were placed under his charge, and were conducted so expeditiously that by July 23 the mine was finished and charged with 8000 pounds of gunpowder. It extended under a Confederate salient that was opposite to Burnside's position. The early morning of July 30 was fixed for the explosion, and a large force gathered for the charge, while orders were issued to threaten Lee's right and divert his attention from the real point of attack. At 4.45 A. M. on the 30th the explosion took place. The effect was tremendous. An immense mass of earth was hurled into the air, together with stone, timber, cannon, muskets, and mutilated corpses; 200 men were killed, and a cavity torn in the Confederate lines 135 feet long, 90 wide, and 30 deep. A heavy cannonade was at once opened all along the line, to which the astonished and dismayed Confederates replied but feebly. The way seemed open for the easy capture of this portion of Lee's works.

The opportunity was lost by delay. The charging column moved slowly and feebly, halting in the crater as if seeking shelter. A division of colored soldiers attempted to storm the hill beyond, but the delay had enabled the Confederates to recover from their surprise, and these troops were driven back into the crater. Here were huddled a large body of disordered troops, on whom the Confederates, hurrying from all quarters to the spot, poured a concentrated fire of musketry and artillery. The slaughter was dreadful, and a disorderly flight began. The result was a loss to the Union forces of about 4400 men, mostly captured, and of less than 1000 to the Confederates; all due, as Grant declares, to inefficiency of the corps commander and incompetency of the division commander who led the assault. An hour passed before the Confederate fire was of any importance, and that hour, if diligently employed, would have sufficed for complete success.

The leading purpose of Grant's later operations was to seize and hold the Weldon and Southside Railroads, the latter of special importance from its usefulness as a Confederate channel of supply and since its capture would open the way to the possession of the Danville Railroad, the remaining channel of communication between Richmond and the South. The possession of this road would force the evacuation of Richmond and the desertion of the formidable line of defensive works which Lee's army had erected with such toil. With this object in view Grant steadily extended his lines south and west of Petersburg, while Lee faced him at every point with new earthworks covering the important arteries of travel which his antagonist

wished to seize. The work of intrenching, however, did not yet supersede all active measures of assault. A vigorous attack was made on the Confederate works to the north of the James on Aug. 13, and repeated on the 16th, while on the 18th the Confederates assailed and were repulsed. The result of these operations was a loss of about 5000 Union soldiers and nearly as many Confederates, with no advantage in that quarter beyond that of the depletion of Lee's weakened ranks.

This affair, however, served as a cover to a more important one. Taking advantage of the absence of many of Lee's troops, who had been sent to strengthen the Richmond lines, Grant ordered a vigorous movement, to secure possession of the Weldon Railroad. On the 18th Warren advanced with the Fifth corps, and reached the railroad without opposition. Leaving Griffin to hold it, he moved with his other divisions towards Petersburg, but ere he had advanced far a Confederate force suddenly attacked his flank, taking 200 prisoners. The assailing force was soon repulsed, and Warren held his ground, but with a loss of about 1000 men. On the following day Warren was attacked in flank by a heavy force under Hill, Crawford's and the right of Ayres' divisions being driven back, with a loss of 2500 men as prisoners. But the railroad was held, and reinforcements coming up Hill hastily withdrew, suffering Warren to recover his lost ground. He at once intrenched his position, satisfied that Lee would do his utmost to recover the road. Three days afterwards the expected attack came. A cross fire of thirty guns was suddenly opened upon his lines, and then two columns of infantry advanced, one in his front and the other on his flank. He was well prepared, however, and easily repelled the front attack, while the flanking column was driven back with a loss of 500 prisoners. In this assault the Confederates lost 1200 men. Warren's total loss in the movement was 4450 men, but he held possession of the road, which Lee made no further effort at this point to recover.

On the day of this last battle, Aug. 21, Hancock moved in Warren's rear and struck the Weldon Railroad at Reams' Station, at which point he was vigorously attacked by Hill on the 25th, and after a desperate conflict forced to retire, with the loss of 2400 men, 1700 of whom were made prisoners. Hill's loss was little less, and he also soon after retired. But this success was of no avail to the Confederates. The Weldon road was irretrievably lost, and the first step in Grant's purpose of cutting off Lee's communication with the South gained.

A month passed in comparative quiet, at the end of which time another assault was made upon the Confederate works, this time north of the James, intended, as Grant states, to prevent Lee sending reinforcements to Early. Gen. Butler received orders to cross the river with the Tenth and Eighteenth corps under Ord and Birney, and Kautz's cavalry, and to attempt by a rapid movement to capture Richmond before Lee could move troops to its defence. The river was crossed on bridges muffled with hay on the night of the 28th, and on the 29th Battery Harrison, the strongest fort in that part of the works, was stormed and carried by Ord's corps, while a strong redoubt on Spring Hill was captured by a storming column of colored troops from Birney's command. These positions were strongly contested, both sides losing heavily, and so important did the Confederates consider Fort Harrison that a desperate effort was made to retake it, under Gen. Lee's immediate direction. He massed some of his best troops against it, but they were repulsed with severe loss, and the captured intrenchments held. Meanwhile Kautz with the cavalry had reached a point within three or four miles of Richmond, when he was attacked and driven back with loss, his pursuers in their turn encountering the Tenth corps and being repulsed with considerable

loss. The total Union losses in this enterprise were 2272 killed, wounded, and missing.

The attack on these intrenchments was only a part of Grant's plan. While the Confederates were struggling desperately in the vain effort to recover their lost works, a vigorous movement was made by Warren on the opposite end of the Union lines, in the direction of the Southside Railroad. This movement took place Oct. 1-2, the Confederates, who fought fiercely to maintain their positions, being gradually pushed back towards the Boydton road. As a result a position was gained and held about three miles west of the Weldon road, with a loss of about 2500 men. In this connection it is also necessary to speak of an effort made by Gen. Butler to cut a canal across a narrow neck of land known as Dutch Gap on James River, which would shorten the stream six or seven miles and enable the fleet to flank several important Confederate works. This effort failed, there not being depth enough of water gained for the intended purpose, the bulkhead, which was blown out with gunpowder, falling back and choking the channel.

The next offensive movement was made by the Confederate forces. On Oct. 7, Kautz's cavalry, north of the James River, was attacked and driven back, losing heavily in killed, wounded, and missing, and all its artillery. This was followed by an attack in force on the Union intrenchments, which was repulsed with severe slaughter. On the 13th Butler made an assault on some new Confederate works, and was similarly repulsed. One further advance movement was made before the armies went into winter quarters. On Oct. 27, the Fifth and Ninth corps were put in motion with the hope of flanking the Confederate lines and seizing the Southside Railroad. Part of the force, however, soon found itself in swampy ground covered with dense thicket, which divided and disordered the several divisions. At this juncture a portion of Hill's corps suddenly fell on an advance brigade and drove it back in confusion with the loss of two guns. The triumphant Confederates pursued eagerly, but suddenly found themselves in presence of a supporting column, and were repulsed with a loss of 1000 prisoners, while 200 of their men rushed into Crawford's lines and were also taken. A vigorous push at that moment might have dispersed or destroyed the whole Confederate division, but night was at hand, the Union commanders in ignorance of each other's position, and the country impracticable. Night fell before anything of importance could be accomplished. The losses on both sides were heavy and nothing was gained in position, the Union column being withdrawn during the night to its former position.

This ended active operations for the winter. For a period of nearly six months the armies had confronted each other, fighting many severe battles, while in the interval almost daily cannonading and picket-firing, with occasional sanguinary encounters, took place along the lines, the total loss from May 1 to November 1 to the Army of the Potomac being given at 88,387. If to this be added the loss of the Army of the James the grand total would be nearly 100,000. Of these 30,000 subsequently rejoined the army, making the eventual loss 70,000. The Confederate loss during the same period has been estimated at 40,000.

In was February, 1865, before further movements of military importance took place. Grant's army had been weakened to aid in operations elsewhere, particularly those against Fort Fisher (*q. v.*), and the troops lay at rest for months, the only movements being cavalry raids outside the lines, and an ineffectual effort on the part of the Confederates to send a squadron through the canal at Dutch Gap and destroy the pontoon bridges below. On Feb. 3, 1865, a conference was held at Hampton Roads between Pres. Lincoln, Secretary Seward, and a party of peace commissioners, including Vice-Pres. A. H. Stephens from the Confederacy. Nothing came of this, however, and it was

decided that the war should go on. Two days afterwards (Feb. 5), another effort was made to win the coveted prize of the Southside Railroad. It was decided to throw a flanking column along Hatcher's Run to the right of the Confederate works, take them in reverse, turn north, and seize the road. This movement was led by Warren, and included the Second and Fifth corps and Gregg's cavalry.

The cavalry were successful in clearing the ground in front of Reams' Station, and encamped for the night on Rowanty Creek. Meanwhile the Second corps crossed Hatcher's Run, and, finding the Confederates in a strong position, threw up temporary earthworks which were soon furiously assailed. The assault was twice repeated, but in vain, and at nightfall the Confederates withdrew. During the night the Fifth corps took position on the left of the Second, and other corps were moved up within supporting distance. Severe fighting took place on the 6th. Gregg's cavalry, which now covered the Fifth corps, was heavily assailed by Confederate cavalry, and towards evening pushed back to Hatcher's Run. Ayres and Crawford were successively assailed and driven back, the assault next falling on Humphreys, who held his ground and repulsed the foe in disorder. The troops were now rallied behind the earthworks which had been thrown up on the previous day and stood firm, the result of the conflict being the permanent extension of the Union lines to Hatcher's Run. The Union loss was nearly 2000, the Confederate about 1000 men.

Towards the end of March Grant prepared for still more decided and aggressive movements. As a preliminary it was important to destroy the Confederate power north of the James, and Sheridan was sent with a strong cavalry force for this purpose. With about 10,000 men that dashing leader rode up through the State, the first resistance of importance being met at Waynesboro, where Early, with 2500 men, was strongly intrenched. Yet Custer, in the advance, rode over his intrenchments and captured 1700 of his men, the remainder being thoroughly dispersed. Custer lost less than a dozen men. About a million dollars worth of Confederate property was destroyed at Waynesboro and in the district to the west of it, and on March 3 Sheridan entered and took possession of Charlottesville, where he made a thorough destruction of the railroads and railroad property for eight miles southward. He now pushed for the James River. Here he found the bridges burned and the river too swollen with rains for his pontoons to be available, so he turned eastward, destroyed the James River canal, an important channel of supply to Richmond, burned bridges all over that region, and dashing north-easterly tore up fifteen miles of the Virginia Central Railroad. This done, he swept round by the Pamunkey River and White House, and rejoined the army on March 26. He had ruined 200 miles of railway, destroyed many bridges and great quantities of stores, and effectually disabled the Confederate power north of Richmond, while so alarming the authorities in that city that they began to pack up ready for flight. The field of operations was decidedly narrowed by this vigorous raid.

On March 24 Grant issued orders for a general movement on the 29th. Lee, perhaps expecting this, perhaps in pursuance of some plan which ill success rendered abortive, had devised a counter movement against the Union lines, which was put into effect in the early morning of March 25. It was directed against Fort Steadman, a strong work in the central region of the intrenchments, south of the Appomattox. It was in front of the Ninth corps, and formed a salient about 100 yards distant from the Confederate intrenchments. Gen. J. B. Gordon had command of the assaulting column, of 3000 or 4000 men, with strong forces ready in reserve. At 4 A. M., March 25, the movement began in a stealthy advance over the intervening ground. In a few minutes the column, unobserved, was in front of the fort, and was dashing up its parapets before the

garrison were fairly aware of their danger. No resistance was attempted, those who were not made prisoners fled, and the guns of the captured work were turned upon the neighboring redoubts, compelling their hasty evacuation. The moment was come for the supporting column to press forward, disperse the troops in rear of the fort, seize the City Point Railroad, and force Grant to some hasty action in defence of his base of supplies. This was not done. For some unknown reason the advance was not made, and the promising opportunity was lost. Gordon was left to bear the brunt of the assault which quickly fell upon his late victorious troops. Fort Hascall, to the left of Fort Steadman, opened on it a terrific fire, under cover of which a heavy column of infantry advanced, and a scene ensued not unlike that which followed the mine explosion. The assailants were in a trap. It was impossible to escape, for the space leading to their own works was swept by artillery fire. Of those that sought to fly the greater number fell, and the bulk of the assailants surrendered rather than attempt it. The attack had failed, Lee's army had been depleted to the extent of 4000 men, and Meade, surmising that Lee must have weakened his lines for this movement, ordered a general advance of the Second and Sixth corps. As a result the strongly intrenched picket line of the Confederates was seized and permanently held.

The attempt to create a diversion in favor of the Confederates had signally failed, and the preparations for the designed movement of the Union army went actively on. A movement in great force was designed, for the general purpose, as Grant states, of placing himself in position to check the flight of Lee's army, which he feared might take place at any moment, and also for the capture of the works covering the Southside Railroad, the possession of which would leave Lee but a single avenue of supply. Lee's intrenched line now extended south-westward from Petersburg to and for some distance beyond the junction of Hatcher's Run with the Boydton road, while four miles westward was a detached line of works, stretching along the White Oak road and covering a strategic point at the junction of several highways known as the Five Forks. It was against the latter intrenchments, the extreme right of Lee's works, that the grand turning column began its march, on the morning of March 29. The Ninth corps, under Gen. Parke, and part of the Army of the James, under Gen. Weitzel, were left to hold the line of Federal intrenchments, and the remainder of the army was put in motion.

Sheridan was sent with the cavalry with orders to ride round the Confederate lines and seek to destroy the contested railroads. He rested for the night at Dinwiddie Court-House, several miles south of Five Forks. On the morning of the 30th he received orders from Grant to change his plan, push round the enemy to his rear, and co-operate with the infantry column. The latter, consisting of the Fifth and Second corps, led by Warren and Humphreys, had met some opposition on the 29th, Warren losing 370 men, but repulsing the enemy. They rested for the night in front of the Confederate works on the line of the White Oak road.

Lee made hasty efforts to protect the imperilled point, but left the major part of his army to defend his works, not knowing but the movement might be a ruse to cover an attack elsewhere. The force sent to Five Forks numbered about 15,000 infantry, with Fitzhugh Lee's cavalry. During all day of the 30th it rained furiously, making the roads almost impassable, and the Union troops remained in their lines. On the morning of the 31st the rain had ceased, but the ground was still so muddy that it was deemed inadvisable to move. Lee thought otherwise. His situation was desperate, and he felt it necessary to repel the line before him. Sheridan was too far distant to cover Warren's left flank, and on this flank, which was entangled in the intricacies of a swampy forest, there fell a sudden and

vigorous Confederate charge. Ayres's division was driven back in confusion, falling upon and breaking Crawford's, and for a moment disaster threatened the Union army. But Griffin's division stood firm, the broken troops rallied behind it, and soon a counter-charge was made which struck the Confederates on their left flank and hurled them back behind their intrenchments with a heavy loss, mostly of men made prisoners. At the same time Humphreys tried to carry the works in his front, but failed. Meanwhile, Sheridan had advanced part of his cavalry towards Five Forks. These encountered and drove back the Confederate cavalry, but the latter were reinforced with infantry, and Sheridan's men in turn were driven back to Dinwiddie Court-House. Here they joined the main body, the cavalry were deployed on foot, and the pursuers were in their turn repulsed. Night fell before they could renew the attack.

Early on the morning of April 1 Sheridan was reinforced by an infantry division of the Fifth corps, and at once started in pursuit of his late assailants. As he advanced he was joined by the remainder of the corps. Leaving the infantry at the point where they had joined him, he pressed boldly on with the cavalry, and by 2 P. M. had driven the enemy into their works at Five Forks. Halting here, he ordered Warren to advance to the White Oak road and attack the Confederate works. There was considerable delay in this movement, and the advancing column met with resistance which threw a part of the line into disorder, but this was soon remedied, and Ayres made an impetuous charge on the Confederate right, carrying a portion of the line and capturing more than a thousand men with several battle-flags. At the same time Merritt's cavalry charged the line in his front, and Griffin carried the works on the left, taking 1500 prisoners. While this was proceeding Crawford turned the left of the Confederate line, cut off retreat in the direction of Petersburg, and turning southward struck the enemy in the rear, capturing four guns. The Confederates were now in a desperate situation, with the cavalry on their front and right, the infantry on their left and rear, yet they continued to fight manfully, until simultaneously the cavalry charged over the works, and Ayres and Griffin, turning their flanks, bore down on them in a furious assault. Defence was no longer possible, many of the defenders threw down their arms, while the rest sought safety in a westward flight, in which they were pursued for miles by Merritt's and McKenzie's cavalry. Thus ended the battle of Five Forks, the Union loss being about 1000, the Confederate loss about 6000 in prisoners, besides a large number killed and wounded. It had a much more important result, however. It opened the Southside Railroad to capture, and reduced Lee to a single channel of communication with the South. But Sheridan could not overlook Gen. Warren's want of promptness at a critical time, and on April 2d sent him to Gen. Grant, who approved Sheridan's action and assigned Warren to less arduous duty.

The success at Five Forks was immediately followed by a bombardment of the works around Petersburg, which was kept up throughout the night and followed by a general assault in the morning. This assault was successful at nearly every point. The works in the vicinity of Hatcher's Run were taken, and about 3000 prisoners with much artillery captured, while the Southside Railroad was reached at several points. At the same time the Ninth corps attacked and carried the lines in its front, driving back the enemy to the inner line of works immediately around Petersburg. Here the Confederates were concentrated and strong, Longstreet's corps being brought up from the defences of Richmond. Vigorous efforts were made to regain some of the works which had been carried by the Ninth corps, Heth charging at the head of his division, and pressing so heavily that supporting troops had to be ordered up from City Point. In this movement A. P. Hill, one of the best of Lee's corps commanders,

was shot dead. Heth was repulsed, and two strong works close to Petersburg, Forts Gregg and Whitworth, carried by assault. Meanwhile Sheridan and Miles had captured an intrenched work at Sutherland Station, on the Southside Railroad. The prisoners taken during this series of assaults Grant states at 12,000.

That Richmond must be evacuated, and at once, was now evident. Any delay would have subjected the defending army to the danger of having every avenue of supply and retreat cut off. The Confederate authorities were advised of the necessity of flight. A wild panic prevailed in the city, and about 8 P. M. Pres. Davis left by the Danville Railroad, while by midnight all the Confederate authorities had departed. The army had similarly been making preparations for a hasty departure. Along the north bank of the Appomattox moved long lines of infantry and artillery through the gloom of the night, over the roads leading to Amelia Court-House. By midnight the evacuation was completed. As morning approached the marching troops saw in the distance behind them a blinding flash of light, followed by a loud explosion, while a lurid glare lit up the gloom of the skies. The first was the blowing up of the magazine at Fort Drewry, the second the conflagration of the city itself, which had been left in flames.

This arose from the attempt to destroy certain large warehouses of cotton, tobacco, and other property, which Gen. Ewell had been ordered by the War Department to set on fire, despite the remonstrances of prominent citizens. When the warehouses were in flames a fresh breeze carried the fire to other buildings, while an intoxicated mob, partly composed of soldiers, reeled through the streets, pillaging stores and committing other excesses, perhaps firing other buildings. The fire spread till nearly a third of the city was laid in ashes. The explosion of the magazine and of several Confederate iron-clads that were blown up, and the subsequent glare of the burning city, apprised the besiegers of what was going on. Early on April 3 Gen. Weitzel, in command north of the city, marched in and took possession, and at once endeavored to extinguish the conflagration and check the excesses of the mob.

On the same morning it became evident that the defenders of Petersburg had vanished during the night. They had stolen away so silently as to give no warning of their flight. The abandoned works were at once entered, and the whole army started in pursuit. Sheridan, with the cavalry and the Fifth corps, was already well out to the west, and moved so expeditiously that by afternoon of the 14th he had struck the Danville Railroad at Jetersville, seven miles south-west of Amelia Court-House, and directly across Lee's line of retreat to Danville.

Meanwhile Lee was in unexpected difficulties. He had marched directly to Amelia Court-House, at which point he had directed a provision train to be left, but some stupid official had sent the provision cars forward to Richmond with the remainder of the train, and the much-needed supplies were being consumed in the conflagration of that city at the moment when the hungry troops reached the point where they expected to find them. This error was fatal to Lee's hopes. Whatever his plans, whether to reach the mountains or to attack the detached columns of his pursuers, the need of food became paramount, and a large part of his force had to be sent out to forage for supplies.

Not until the evening of the 5th could the retreat be resumed, and then with a very inadequate supply of food. Sheridan was by this time too strongly reinforced to be safely attacked, and the line of march was directed westward, towards the mountain region. On that evening a Confederate train of 180 wagons, moving westward, had been destroyed by a party of cavalry, and on the 6th the force at Jetersville advanced upon Amelia Court-House to attack Lee, who, however, had left that place, and was marching rapidly towards Deatonville. The cavalry followed at full

speed, while the infantry was pushed forward with all rapidity. Sheridan was seeking to outmarch Lee and head off his columns. Near Deatonsville he sent Crook to attack a Confederate wagon train, which was strongly defended. Crook was repulsed, but meanwhile Custer had reached the line of retreat at Sailor's Creek, a small stream farther on. Here, being joined by Crook and Devens, he pierced the Confederate line, not only capturing 400 wagons, 16 guns, and many men, but cutting off Ewell's corps, which formed the rear guard of Lee's army. Sheridan at once ordered this corps to be attacked and detained till additional troops could come up. Ewell's resistance was vigorous, but his assailants increased until he was enveloped in a network of charging horse and foot, when his men threw down their arms and surrendered. About 7,000 men were made prisoners, among them Ewell and four or five other generals.

At this time Ord was moving rapidly towards Farmville on the line of retreat, and had sent forward a light column of infantry, under Col. Washburn, to destroy the bridges at this point. Later Gen. Read was sent with some cavalry to bring him back, but, on the contrary, he attacked the van of Lee's army and detained it for a considerable time. In the end Read was killed, and all that remained of his force of 600 men captured, the enemy saving the bridges. But Read's daring attack had occasioned the Confederates the loss of much valuable time, during which Ord was rapidly approaching. During the night Lee succeeded in crossing the Appomattox over the bridges at Farmville with what was left of his shattered army. He tried to prevent pursuit by burning the bridges, but the van of Humphreys' corps saved the wagon-bridge, and Barlow's brigade was soon across it. Only a weak rear guard was found, which quickly retreated, abandoning 18 guns, which their draught animals were too weak to draw farther. Of the men numbers had dropped from the ranks, thousands had let fall their muskets from sheer weakness, and the half-starved remnant of the army, worn out with want of sleep and food and the weariness of the march, dragged slowly onward over the muddy roads and the streams swollen with the spring rains.

On the night of April 6 a consultation had been held by a number of Lee's principal officers, at which it was decided that further resistance was hopeless, and that negotiations should be opened for a surrender. Gen. Pendleton communicated this decision to Gen. Lee, but the latter declared that all hope was not yet lost, and that he was still determined to resist. There were supplies at Appomattox Court-House. Could he obtain these and cross the Staunton River he might be able to maintain himself beyond that stream until a junction could be made with Gen. J. E. Johnston, then in North Carolina. A slight success in battle encouraged him. Humphreys had crossed the Appomattox in pursuit with the Second corps, and came up in the afternoon of the 7th with the rear of Lee's army. He found it intrenched, the roads being defended with a line of works extending for a considerable distance. An assault was made by Miles's division, which was repulsed with a loss of about 600 men.

Meanwhile Sheridan was pushing forward with all speed, making every effort to get in Lee's front and cut off the route to Lynchburg which the fugitive army was pursuing. In the rear the infantry forces were moving with the utmost celerity, the whole Army of the Potomac being on the track of the fugitives, who were now reduced to about 10,000 effective men, though they numbered in all about 28,000. Many were defenceless from having thrown away their arms in the hurry of flight. On the 8th the retreat, being uninterrupted, progressed more expeditiously than on the previous day. Two days' rations had been obtained at Farmville on the evening of the 6th, while further supplies awaited the retreating army at Ap-

pomattox Court-House, toward which place it now strained forward.

But Sheridan was advancing rapidly upon the same point. On the 7th Gen. Crook had attacked a body of infantry guarding a wagon-train, but was repulsed and Gen. Gregg made prisoner. On the 8th Gen. Custer, in command of the advance, made a forced march of thirty miles to Appomattox Station on the Lynchburg Railroad, and captured four trains of cars loaded with the supplies upon which the last hopes of the fugitives had depended. The vanguard of the retreating army was just then approaching, and was pushed back by Custer, who had been reinforced by Devlin, to Appomattox Court-House, near which was Lee's main body; twenty-five guns, many wagons, and a large number of prisoners were captured. Sheridan hurried forward the remainder of his command, and on the evening of the 8th the cavalry column stood directly across the pathway of Lee's army, while the infantry were advancing by forced marches upon its front and rear. The last moments of the Army of Northern Virginia were at hand.

During the last two days correspondence had been going on between Grant and Lee in reference to surrender. Grant at 5 P. M. on the 7th wrote, demanding a surrender, as further resistance was hopeless. Lee replied, asking what terms he would offer. Grant rejoined on the morning of the 8th, insisting upon but one condition, that the men and officers surrendered should be disqualified from taking up arms again until properly exchanged. Lee replied that he had not intended to propose surrender, but to ask for terms only, and did not think the emergency had arisen for the surrender of his army, but would be pleased to meet Grant at 10 o'clock on the following morning, to confer on the question of the restoration of peace, but not upon surrender. Grant rejoined that such a conference would be useless, and that only by the Confederates laying down their arms could peace be secured and the destruction of life and property brought to an end.

Lee was well aware that his last hope lay in cutting his way through Sheridan's lines before they could be strengthened by infantry. Orders for an advance were given, and at 3 A. M. on the 9th the Confederate lines moved silently forward. Gordon commanded the advancing column, which was supported with cavalry and thirty pieces of artillery. The charge on Sheridan's men, who had dismounted to meet it, was made with such energy that they were driven back. Sheridan, who had just reached the front, and was hurrying up the wearied infantry, sent orders to the cavalry to fall back slowly, but to offer resistance at every point until assistance could reach them. Gordon's line continued to advance while this movement was being made, when the cavalry suddenly opened its ranks, and revealed to the eyes of the dismayed Confederates a solid line of men in whose hands glittered muskets and bayonets. The infantry had arrived, and the last hope of the fugitive army vanished.

Gordon sent back to Lee, saying that it was impossible to continue his advance without powerful reinforcements. No such reinforcements could be sent and but one course remained—to treat for surrender. The bugles had sounded and the cavalry again sprung to their saddles, ready to charge, when a white flag appeared in token of surrender. At the same time a reply from Lee to Grant's last note was sent across the lines, in which he agreed to a meeting in reference to surrender. Grant, who was hurrying forward to the front when he received Lee's note, at once returned an assenting answer, and arrangements were made for the interview in the parlor of the dwelling of Wilmer McLean, at Appomattox Court-House. Here the meeting between the two commanders took place, at 2 P. M. on Palm Sunday, April 9. The terms of surrender were discussed and settled, and were signed about 3.30. Grant's offer of terms was very

lenient. He simply required that Lee, with his officers and men, should give their parole of honor not to take up arms against the government until regularly exchanged. All military material and public property was to be handed over, but the officers were allowed to retain their side-arms and private horses and baggage. Officers and men were to be allowed to return to their homes, and not to be disturbed by United States authority so long as they observed their paroles and obeyed the laws. In addition to these written terms Grant agreed, at Lee's suggestion, to allow all Confederate cavalry that owned their horses to retain them, saying that they would need them to till their farms.

At Lee's request the exhausted Confederates, who had been living for several days on parched corn, were granted rations, which were served to them out of the car-loads of provisions which had been captured by the cavalry. On Wednesday, the 12th, the captive soldiers were marched to an appointed place near the village, where they stacked their arms and gave their paroles, each company or regimental commander signing the parole for the men of his command. The total number paroled was 2781 officers and 25,450 men, making 28,231 in all. In addition there had been taken prisoners, since March 29, 19,132 Confederates, besides the large number killed and wounded and all those that had dropped from the ranks during Lee's headlong flight, so that Lee's army at the time of the general assault must have numbered considerably over 50,000 men.

Thus ended the career of the Army of Northern Virginia, whose members at once dispersed, the soldiers hastening to their homes in all directions, while Gen. Lee returned alone to Richmond, where for some months he resided as a private citizen. His surrender brought the war to an end in all quarters. Johnston, as soon as he heard of it, at once proposed to surrender to Sherman, and what troops remained in arms throughout the Confederacy quickly followed the example, the last to surrender being a force under Kirby Smith, in Texas, who continued to resist till May 13, when their main body was surrounded and forced to yield. Smith's formal surrender was made on May 26, and with it ended the last show of resistance in the great civil war, which for four years had spread ruin and desolation throughout the country.

(C. M.)

RICKETTS, JAMES BREWERTON (1817-1887), general, was born in New York, June 21, 1817. He graduated at West Point in 1839 and entered the artillery service. He was engaged in frontier duty until the Mexican war, in which he served with distinction at Monterey and Buena Vista. He was again employed on the frontiers and in 1859 had an engagement with the Mexican bandit Cortinas. At the outbreak of the civil war he was placed in command of a battery of rifled guns, which he used skilfully at the battle of Bull Run. But being severely wounded, he was captured and for eight months was a prisoner in Richmond. His commission as brigadier-general was made to date from the battle. He commanded a division in the Third corps of Gen. Pope's army, and was wounded in the second battle of Bull Run. At Antietam, when Gen. Hooker was wounded, Ricketts succeeded to the command of his corps. He was engaged in the subsequent campaigns against Richmond and in the Shenandoah Valley, and reached the rank of major-general. He was retired from active service in 1867, and served in courts-martial for two years longer. He died at Washington, D. C., Sept. 22, 1887.

RIDDLE, MATTHEW BROWN, exegete, was born at Pittsburg, Oct. 17, 1836. He graduated at Jefferson College, Philadelphia, Pa., in 1852, and at New Brunswick Theological Seminary in 1859. After a year's study in Germany, he became in 1861 chaplain of a New Jersey regiment, and then held pastorates of Reformed churches at Hoboken and Newark. After

a second visit to Europe he was in 1871 appointed professor of New Testament exegesis in the Hartford Theological Seminary, and in 1887 was called thence to the Western Presbyterian Theological Seminary at Allegheny, Pa. Dr. Riddle was a member of the American Committee on the revision of the New Testament, translated and edited four Pauline Epistles in Dr. Schaff's edition of *Lange's Commentary* (1869), and contributed to Dr. Schaff's later commentaries. He also revised Dr. Edward Robinson's *Harmony of the Gospels*, Greek (1885) and English (1886). To the American edition of the *Ante-Nicene Fathers* he edited the *Teaching of the Twelve Apostles* and *Second Clement*, and contributed to the *Nicene Fathers*. He has also prepared and edited other works relating to the New Testament, and has contributed to this work several articles on New Testament topics.

RIDGWAY, ROBERT, ornithologist, was born at Mt. Carmel, Ill., July 2, 1850. At an early age he showed fondness for natural history and a correspondence with Spencer F. Baird (*q. v.*) in 1864 led to his appointment a few years later as naturalist in Clarence King's U. S. geological survey of the 40th parallel. In the *Report* of this exploration he edited the department of ornithology. He was afterwards connected with other government surveys, and in 1879 was appointed curator of the department of birds in the U. S. National Museum. He has published over 200 papers on ornithology, including several catalogues. He was associated with S. F. Baird and T. M. Brewer in preparing a *History of North American Birds* (3 vols., 1874), and has since published *Water Birds of North America* (1884), *Nomenclature of Colors for Naturalists* (1886), and *Manual of North American Birds* (1887).

RIEDELSE, FRIEDRICH ADOLPH, BARON VON (1738-1800), Hessian general, was born at Lauterbach, Hesse, June 3, 1738. He studied at Marburg University, and entering the army was employed by the British in the Seven Years' War. Having risen to the rank of major-general in 1776, he was sent to America in command of a division of Brunswick troops, hired to Great Britain. His wife, daughter of the Prussian minister Massow, accompanied him. After a year spent in Canada, Riedesel was called to take part in Burgoyne's expedition. He fought at Ticonderoga, Stillwater, and Saratoga, and surrendered with Burgoyne Oct. 17, 1777. With his wife he was taken to Albany, where Gen. Philip Schuyler handsomely entertained them until they were ordered to Cambridge, Mass. He remained a prisoner until November, 1780, having spent some time in Virginia. He next had command of Long Island, but in 1781 went to Canada and two years later returned to Germany. In 1787 he became lieutenant-general and had command of the Brunswick troops in Holland until 1794, when he was placed in charge of the city of Brunswick, where he died Jan. 6, 1800. Both Baron Riedesel and his wife wrote interesting *Letters and Journals* of their residence in America, which give valuable side-light on the war of the Revolution. They were translated and edited by W. L. Stone (Albany, 1867 and 1868).

RIEL, LOUIS (1844-1885), Canadian rebel, was born at St. Boniface, Manitoba, Oct. 23, 1844. His father was a leader of an Indian revolt against the rule of the Hudson Bay Company in 1849. The son was educated in the Jesuit College at Montreal, and in 1869 was made secretary of a committee of the Metis, or half-breeds, of the North-west Territory, to demand from the Dominion of Canada part of the sum paid to the Hudson Bay Company for its lands. When this was refused, he was made president of a provisional government at Fort Garry. On the approach of Sir Garnet Wolseley's expedition, early in 1870, Riel fled from the country but afterwards returned and was not molested. In 1873 he was elected to the Dominion Parliament, but was not permitted to take his seat, and after a second election he was expelled. In Feb-

ruary, 1875, he was sentenced to banishment for five years, and forfeiture of political rights. He removed to Montana, but in July, 1884, returned to his former haunts and fomented rebellion. In March, 1885, he again attempted to form a government and attacked employes of the Dominion. The rebellion was suppressed by Gen. Middleton and Riel was carried to Regina for trial. He was convicted of treason and executed Nov. 16, 1885. There is strong proof that he was insane, and the French Canadians who sympathized with his actions strongly denounced the government for its harsh measures towards him.

RIGGS, ELIAS, missionary, was born at New Providence, N. J., Nov. 19, 1810. He graduated at Amherst College, Mass., in 1829, and at Andover Seminary in 1832. While here he prepared some Chaldee text-books. He was then sent by the American Board of Missions to Greece, and in 1838 transferred his work to Smyrna. In 1853 he removed to Constantinople, where he has since remained, except when visiting the United States in the interest of his work. In 1857 he came to New York to have his translation of the Bible into the modern Armenian language stereotyped, and during his stay taught Hebrew in the Union Theological Seminary. He translated the Bible also into the Bulgarian language and prepared a *Bible Dictionary* and *Harmony of the Gospels* in that language. The translation of the Bible into modern Turkish, having been thoroughly revised by a committee of which he was a member, was issued in 1886. Dr. Riggs has also prepared grammatical works on the Armenian, Turkish, and Bulgarian languages, and published tracts and hymns in those tongues. He also published suggestions of emendations for the English Old Testament (1873) and modifications of the revised version of the New Testament (1883).

RIGGS, STEPHEN RETURN (1812-1883), missionary, was born at Steubenville, Ohio, March 23, 1812. He graduated at Jefferson College, Pa., in 1834, and having entered the Presbyterian ministry was sent by the American Board to a mission near Fort Snelling in 1837. His service was among the Dakotas, for whom he prepared various books, as well as a *Dakota Vocabulary* (1852) and *Grammar and Dictionary of the Dakota Language* (1852). During the Sioux war of 1862 Dr. Riggs and his family were obliged to flee. He then became chaplain of the expedition that marched against the hostile Indians. His later years were spent in field-work during the summer and in translating the Bible into Dakota during the winter. This translation was published in 1879. Dr. Riggs died at Beloit, Wis., Aug. 24, 1883. Besides his works in the Indian tongue, he published *Tahkoo Wakan, or the Gospel among the Dakotas* (1869) and *Forty Years among the Sioux* (1880). Altogether he published about fifty books relating to the language and the people to whom his life was devoted.

RILEY, CHARLES VALENTINE, entomologist, was born in London, England, Sept. 18, 1843. He was educated in France and Germany and in 1860 removed to the United States. Settling in Illinois he became practically acquainted with farm-life and edited an agricultural journal. In May, 1864, he entered the army and served till the close of the war. He then returned to his editorial work and in 1868 was made State entomologist of Missouri. His later work is sketched under AGRICULTURE, chap. ix., at end. He has contributed several articles to this work.

RINEHART, WILLIAM HENRY (1825-1874), sculptor, was born near Frederick, Md., Sept. 25, 1825. His early life was spent on a farm, but in 1846 he went to Baltimore, where he became a stonemason. Soon his taste for high art was developed and he began modelling in clay. In 1855 he went to Italy and in 1858 he settled at Rome, though he made occasional visits to Baltimore. He completed the modelling of the bronze doors of the U. S. Capitol at Washington, left unfinished by Crawford. Among

his ideal works were *The Angel of the Resurrection*, *The Woman of Samaria*, *Leander, Hero, St. Cecilia*, *Ladona and her Children*, *Atalanta*, and above all, *Clytie*, which he considered his masterpiece. It now belongs to the Peabody Institute of Baltimore, and in that city many others of his works have found owners. Besides numerous portrait busts, he executed for the State of Maryland the heroic statue of Chief-Justice Taney at Annapolis. Rinehart was cut off prematurely at Rome, Oct. 28, 1874. He bequeathed \$45,000 for a lectureship in Baltimore on sculpture and a fund for needy art-students.

RIOTS. The general principles of the law in regard to riots are the same in the United States as in England. The different degrees of criminality on the part of those participating in a riot are defined in substantially the same manner, but the penalties are generally milder than those imposed by the English statutes. The course to be pursued by the authorities in suppressing a riot is essentially the same as in England. The "riot act," which it is the duty of the sheriff, mayor, or other officer to read or attempt to read before proceeding to extreme measures, is almost identical in words and quite identical in substance with the English statute. The circumstances which justify and require the summoning of the military to the aid of the civil authorities are in substance the same, and the duties imposed upon them and their responsibilities are the same.

In law as well as in popular language and thought the chief characteristic of a riot is the sense of insecurity, the terror and distress which it causes among peaceable and quiet citizens. It is a breach of the peace on a great scale, aiming at the injury of individuals and the destruction of property in a tumultuous, disorderly, violent, and unlawful manner. The ultimate cause of a riot may sometimes be found in the existence of evils which afford just ground of complaint on the part of large classes of persons. But it almost invariably happens that an attempt to remedy such evils, by means of a riot, only ends in their aggravation. A large majority, however, of riots originate in prejudice, superstition, or ignorance, and are unmixed evils.

Many riots have become historical from their magnitude and from destruction of property and the bloodshed by which they were accompanied. We can here notice only a few, which may serve as characteristic specimens of such occurrences.

A minute and accurate knowledge of the anatomy of the human body is the indispensable foundation of the science of medicine. Such knowledge can only be acquired by the dissection of the body. But, even in the most civilized countries, large classes of the people, especially the more ignorant, have always regarded this treatment of the human body with aversion and horror, considering it as a kind of sacrilege. Hence the medical profession and especially medical students have in all countries been exposed to outbursts of popular fury. One of the most noteworthy of these outbursts occurred in the city of New York in 1788, and is known as the "Doctors' riot." In 1785 Dr. Richard Bailey obtained permission to use some rooms in City Hospital for delivering anatomical lectures to medical students and for use in making dissections and preserving anatomical preparations. Gradually there sprang up among the working classes a general belief that the medical students were stealing bodies from the cemeteries. On Sunday, April 13, 1788, some boys playing about the hospital found a ladder which afforded access to an upper window, and one, looking in, saw a student engaged in dissecting a body. He told his father, who spread the story among his fellow-workmen, and a crowd armed with their tools and other weapons gathered. The whole city was soon in an uproar; the hospital was surrounded and the doors broken in. The collection of anatomical specimens was destroyed. The

discovery of several "subjects" inflamed the fury of the mob, who now began to threaten the whole medical profession. Physicians took refuge in the jail, where they were guarded by the hastily summoned militia. Dr. Cochrane's house was ransacked in a fruitless search for subjects, while Dr. Hicks escaped by the roof. During the night bands of rioters marched through the streets, and the next morning were joined by some sailors. They now attempted to storm the jail, threatening to hang all the doctors. Gov. Clinton, Mayor Duane, Secretary Jay, Baron Steuben, Alexander Hamilton, and other prominent citizens endeavored to stay the fury of the mob. Appeals and threats were alike in vain. Finally, after Mr. Jay, Baron Steuben, and others had been badly wounded by stones, the governor gave the militia the order to fire. One volley sufficed. Five of the rioters were killed, seven or eight badly wounded, and the rest fled. The riot was at an end.

Whenever a widely extended abuse has become interwoven with the apparent interests, the prejudices, and the passions of large portions of the people, the early reformers who give utterance to protests against it are liable to encounter riotous demonstrations. From 1830 to 1840 riots of which the anti-slavery men were the victims were frequent in different parts of the United States. These riots were not, perhaps, intentionally but none the less effectually stimulated by the language and conduct of the most respectable citizens. In the summer of 1834 a mob attacked the houses of Arthur and Louis Tappan, prominent anti-slavery men. Having sacked the houses, they made a huge bonfire of the plundered furniture in the middle of the street. Mayor Lawrence called out the militia and they assembled in front of the city-hall. Meantime the mob surrounded the residence of the Rev. Dr. S. H. Cox (*q. v.*), barricaded the streets, and were proceeding to demolish the house. The militia, marching to its defence, were assailed with stones and other missiles, but finally succeeded in dispersing the mob without firing upon them.

Of riots originating in religious bigotry one of the most disgraceful that ever occurred in the United States was that which resulted in the burning of the Ursuline Convent in Charlestown, Mass., in 1834. The Ursuline order of nuns of the Roman Catholic Church was instituted in 1536, for the purpose of administering relief to the sick and the afflicted and of superintending the education of female youth.

In 1820, with the aid of funds contributed by a native citizen of Boston, four ladies of this order established a school in that city. In 1826 they removed to Charlestown, where a building erected for them was enlarged as the fame of the school increased. The number of nuns varied from four to ten, and the only restrictions upon their intercourse with outside society were such as are considered proper in any well-regulated female seminary. The number of pupils varied from 40 to 60, mostly children from respectable Protestant families, and the teaching was entirely free from any attempt to influence the religious convictions of the pupils. But the fact that the institution was called a convent and was under the patronage of the Roman Catholic Church excited the hostility of many people of Charlestown and the adjoining towns, who gave credence to absurd rumors. On Aug. 10, 1834, an inflammatory handbill was posted in various places. On the 11th the select men of Charlestown applied for permission to examine the interior of the building. Accompanied by the very lady who, it had been reported, had been forcibly detained and put to death for attempting to escape, they searched every nook and cranny, and when they left they assured the lady-superintendent that they would the next day in the public press inform the people that everything about the institution was of the most exemplary character. Yet, about 9 P. M. a mob began to gather around the building, which then contained 10 adults and 60 children. At 11

o'clock the rioters commenced their attack. The lady-superintendent twice appeared upon the piazza and endeavored to reason with the mob. Finding this in vain, she and her assistant gathered the children and led them to the garden, where they remained terrified spectators of the destruction of their home. Beds, clothing, furniture, including costly pianos and harps, were piled in the middle of the rooms. About 1 A. M. the torches were applied and the whole was soon in flames. The mob next attacked the library, or, as it was called, the Bishop's lodge, which was burned to the ground. Next they set fire to the farm-house and barn belonging to the convent. Finally they even broke open the tomb and wrenched the silver plates from coffins. While these things were going on thousands of people had assembled from Boston and the adjoining towns, but the authorities to their lasting disgrace did nothing to stay the work of destruction.

Scarcity of food has, in all ages and countries, been a prolific source of riots. Such scarcity in almost all cases is the effect of natural causes entirely beyond human control. The immediate result is a rise in prices, which the poorer classes of society almost always attribute to the action of speculators, and often by a riotous destruction of the very thing needed aggravate the evils from which they are suffering. The distress arising from the great financial revulsion of 1836 was augmented by a partial failure of the crops. It became necessary to import large quantities of wheat from Europe. During the winter of 1836-37 the price of flour in New York city rose to \$15 a barrel, and the distress among the poor was very great. Early in February placards were posted in streets headed: "BREAD! MEAT! RENT! FUEL! Their prices must come down," and calling a meeting in the park. About 6000 persons, mostly foreigners, assembled, and after listening to inflammatory harangues, started to attack the dealers in flour and grain. Mr. Eli Hart was reported to have over 50,000 bbls. of flour in his store, besides a large quantity of wheat. Thither the mob proceeded, and though the mayor with a large force of police endeavored to defend the building, his men were soon overpowered, the doors were broken in, and hundreds of barrels of flour were pitched into the street. They were broken by the fall, and the strange spectacle was presented of men who claimed to be starving trampling knee-deep in flour. Other stores were attacked, but large numbers of citizens joined with the police, and by nightfall the rioters were dispersed.

Of riots founded upon personal considerations stimulated by national prejudices, perhaps the most remarkable that has ever occurred in the United States was that known as the "Astor Place Riot." The tragedian Edwin Forrest, having met an unfavorable reception in England, attributed the hostile criticism of the English press to the influence of W. C. Macready. In 1849 the latter came to the United States to play a farewell engagement, which was so successful that he undertook a second engagement. Forrest's admirers determined to prevent this. On the first night of Macready's appearance in his second engagement, May 7, he was driven from the stage by the violence of a portion of the audience. Again on May 10 he presented himself before a brilliant audience, among whom a large number of policemen were interspersed. Champions of Forrest were also present, and when Macready appeared not only received him with hisses and yells, but hurled at him chairs, eggs, and other missiles. By the joint efforts of the respectable portion of the audience and the police, order was restored and the play went on. But a crowd of 20,000 persons had gathered outside, many being attracted merely by curiosity. Some active participants claimed to be defending the cause of an American against an English actor, but the larger part of the mob—roughs, rowdies, and thieves—were actuated solely by the love of disorder and the hope of plunder. While some were armed with pistols, others found a supply of weapons in stones

which had been piled up in repairing adjoining streets. A body of 300 policemen, detailed to defend the opera-house, were soon overpowered. Stones fell among the audience, and women in their terror crawled under the seats. The outer doors of the opera-house were of iron, very strong, and all opened outwards; now locked and barred, they withstood the assaults of the mob until succor arrived. At the request of the civil authorities Gen. Sanford, the division commander, had kept the Seventh regiment, N. G., in readiness, and now ordered them to the scene. Preceded by a company of cavalry ten abreast, they arrived at Astor Place about 9 o'clock; the cavalry charged through Astor Place from Broadway to Third avenue, but the showers of stones rendered the horses unmanageable. Then the Seventh regiment, under Col. Duryea, charged through Astor Place from Broadway to Third avenue, through Eighth street to Broadway, down Broadway to Astor Place again, and formed in line in front of the opera-house. The mob returned to the attack, and Gen. Sanford, Gen. Hall, Col. Duryea, Capt. Shumway and Pond were all severely wounded, together with a large number of the men. The mayor still declined to give permission to fire, but sheriff Westervelt assumed the responsibility. Recorder Tallmadge gave a last warning to the mob, and this being disregarded, the order to fire was given. The first volley, directed over the heads of the crowd, produced no effect upon the mob, but unfortunately resulted in killing and wounding some innocent persons in other streets. The next volley was fired point-blank into the midst of the mob with terrible effect. The regiment then charged and the mob fled. But their leaders rallied them again in Eighth street and Lafayette Place and renewed the conflict. A third volley was enough. The rioters fled in all directions, and the struggle was ended. Twenty rioters were killed, and over 50 more or less severely wounded. None of the regiment were killed, but 150 were wounded, 70 so severely that it was necessary to carry them to their homes. Many of them carried the scars for the rest of their lives. Eyewitnesses were unanimous in the statement that the conduct of the regiment throughout was perfect. The regiment has on later occasions been called upon to aid in the suppression of riots, but generally all disorder has ceased the moment it appeared upon the ground.

The "Draft Riots" in New York city in July, 1863, occupy altogether too large a place in the history of the civil war to be treated here. But it may be remarked that the simple love of plunder was far more powerful than is generally supposed in prolonging the disturbance. Before the Colored Orphan Asylum was set on fire, all that was portable of the furniture was carried off uninjured, not only by the rioters themselves but by their wives and children.

Nearly all the riots which have occurred in the United States in recent years have been connected with what are called "labor troubles." Most of these disturbances have been brought to end without any extensive destruction of property and without bloodshed. (See STRIKES.) The great "Haymarket Riot" in the city of Chicago was of a different character. The great and acknowledged political and social evils existing in Europe have, during the present century, given rise to multifarious and contradictory schemes of reforms. One class of those who profess to seek the reformation of these evils regard the accumulation of property by individuals as the source of all the misery in the world. Their doctrine may be stated thus: the destruction of capital and the slaughter of capitalists is the indispensable preliminary to the removal of social evils. The name of "Anarchists" has been applied to these men, and they themselves have accepted the designation with alacrity and pride. Almost all the Anarchists have emigrated from Europe to the United States, some from fear of the law, others because they supposed that the greater freedom of speech and of the press in this country would afford them a better oppor-

tunity to propagate their doctrine. They also quickly observed the difference in the means available for enforcing the law and preserving public order in this country and in Europe. In Europe not only were the laws far more severe and the civil authorities more strict and less scrupulous in their execution, but every attempt of the Anarchists to carry out their designs was immediately and relentlessly crushed by a vast and well-disciplined standing army ever present and always ready and obedient. In the United States the preservation of law and order, as the Anarchists saw, depends almost exclusively upon the civil authorities. The only military force which they in case of necessity could call to their aid is the militia, composed of citizens who are usually engaged in their ordinary peaceful avocations. The regular U. S. army, only a handful when compared with that of any of the great powers of Europe, is widely distributed in small garrisons, mostly on the frontiers, and the assistance of any portion of it in the suppression of a riot could only be obtained after a compliance with tedious formalities. As a rule no military power is anywhere visible.

Various circumstances had made the city of Chicago a sort of head-quarters of the Anarchists. There they established an organ, the "*Arbeiter Zeitung*," in which the advocacy of arson and murder was hardly disguised. They held frequent meetings and labored vigorously to excite the enmity of the working people against their employers. On Saturday, May 1, 1886, about 40,000 laboring men struck work demanding that eight hours instead of ten should thereafter be considered a working day. Large processions of workmen marched through the streets, visiting the great industrial establishments and urging those who had returned to their work to join them. Business was almost entirely stopped. The railroads were at a standstill. The freight-houses were closed and barred, and the few freight-handlers who had not joined in the strike worked under the protection of guards with revolvers in their hands. The processions of strikers, especially those in which Germans, Poles, and Bohemians predominated, halted at intervals to listen to the inflammatory harangues of Anarchist orators. But no actual violence of any account was committed. On Monday morning, May 3, a great crowd gathered about the McCormick reaper-works and endeavored to prevent the hands from returning to work. They succeeded in forcing or frightening about 700 of the men into a compliance with their demands. About the same number entered the building and resumed work. At noon the company announced to these that the eight-hour day would be adopted, and that the men could also have a half holiday. But the crowd outside, unaware of the fact, assailed the men as they left the building. Some of them escaped by flight, and the others retreated into the building. The mob then began demolishing the windows with stones. A volley fired over their heads by the small guard within was greeted with shouts of derision, and the mob proceeded to attack the doors with crowbars. A patrol wagon filled with policemen drove into the crowd; the policemen alighted and drew their revolvers. But a large portion of the mob were also armed, and after discharging a volley of stones, followed it up with a volley of bullets. The policemen returned the fire. None of them were hurt but some of the crowd were wounded, and when a reinforcement of the police arrived the rioters fled. In the evening handbills printed in English and German were posted about the city calling upon workmen to meet on the evening of the next day, Tuesday, May 4, in an open place known as the "Old Haymarket," at the corner of Des Plaines and Randolph streets. At the appointed time about 1400 men assembled, many of whom had been prominent in the riot of the previous day. A violent rainstorm compelled some to retire, but the rest remained to listen to the speeches of the Anarchist orators. A police force of about 200 men, stationed at a short distance, were

kept informed of the proceedings of the meeting. The first speaker was quite moderate, the second more violent, and the third was so outrageous and his advice was received by the crowd with such marks of approval that the police captains decided that a serious riot could only be prevented by dispersing the meeting. A line of 170 policemen was formed and marched up Des Plaines street. When near the wagon from which the Anarchist orators had been speaking, the police halted and Capt. Wood ordered the crowd to disperse. Their answer was as terrible as it was unexpected. First a dynamite bomb was thrown into the midst of the police and this was immediately followed by a murderous fire from the revolvers of the rioters. Seven policemen were killed and more than fifty wounded. But the well-disciplined force did not quail; drawing their revolvers, they charged and dispersed the rioters after killing and wounding a large number.

Eight of the Anarchist leaders were arrested and tried in the following July. They were all convicted of murder, and according to the laws of Illinois their punishment was fixed by the jury which convicted them. One was sentenced to fifteen years' imprisonment, and seven were condemned to death. They were defended by able counsel and after conviction every resource known to the law was exhausted in the endeavor to escape the verdict. The case was carried to the State Supreme Court and then to the U. S. Supreme Court. By both these courts the verdict was affirmed. As a last resort recourse was had to the pardoning power and the mercy of the governor was invoked. This was so far successful that the sentences of two of the criminals were commuted to imprisonment for life. One of the others succeeded in obtaining the means of manufacturing a small dynamite bomb, with which he committed suicide by exploding it in his mouth. The other four were hanged Nov. 11, 1887.

An impartial examination of the history of a riot will in almost every case show that it is an unmitigated evil. By far the greater part of the terror and destruction by which a riot is accompanied falls upon those who are in no way responsible for the causes which have produced it. For this reason a riot tends to array the opinions and sentiments of the majority of peaceable and law-abiding citizens not only against the rioters themselves but also against the objects the accomplishment of which the rioters are striving to advance. Hence a riot is almost invariably not only a crime but a blunder. When a riotous assembly assumes the dimensions of a mob the great majority of the crowd is, in almost every case, composed of persons whose presence is due to curiosity alone. There is abundant evidence to show that many riots which have appeared formidable in extent, which have been accompanied by immense destruction of property, and which have required the united efforts of large civil and military forces and the loss of many lives for their suppression, would have dwindled to ridiculously small proportions if all persons who were peaceably disposed had retired the moment they saw that violence was contemplated. The safest course for the law-abiding citizen, the most effectual aid he can render to the authorities, and the highest duty he can perform, is simply to go home. If all good citizens adopt this course, in nine cases out of ten the riot will end without the destruction of property and without the shedding of blood.

(W. M. F.)

RIPLEY, ELEAZER WHEELLOCK (1782-1839), major-general, was born at Hanover, N. H., April 15, 1782, being son of Rev. Sylvanus Ripley, D.D. (d. 1787), professor of divinity in Dartmouth College, and nephew of Rev. John Wheelock, president of the college. He graduated there in 1800, practised law in Maine, and was elected to the Massachusetts Legislature in 1810, and to the Senate in 1812. He then entered the army as lieutenant-colonel, and was engaged in Canada, being wounded at York (now Toronto). In 1814 he was made brigadier-general and took part in the battle

of Chippewa, and was wounded at Niagara. In the defence of Fort Erie he was shot through the neck, but recovered and received from Congress a gold medal. Resigning from the army in 1820, he settled in Louisiana, where he practised law. In 1835 he was elected to Congress and was still a member when he died at West Feliciana, La., March 2, 1839.

RIPLEY, HENRY JONES (1798-1875), Baptist minister, was born at Boston, Jan. 28, 1798. He graduated at Harvard in 1816, and at Andover Theological Seminary in 1819. For some years he was a pastor in Georgia, and in 1826 he was made professor of Biblical literature in Newton Theological Institution, and in 1839 he became professor of sacred rhetoric in the same. Resigning in 1860, he again engaged in evangelistic work in Georgia, but in 1865 he returned to Newton as librarian, and afterwards was associate professor of Biblical literature. He died May 21, 1875. Among his publications are *Christian Baptism* (1833); *Notes on the Gospels* (2 vols., 1837-38), and on some other parts of the New Testament; *Sacred Rhetoric* (1849); *Church Polity* (1687).

RIPLEY, ROSWELL SABINE (1823-1887), Confederate general, was born at Worthington, Ohio, March 14, 1823. He graduated at West Point in 1843 and entered the artillery service. In the Mexican war he was aide to Gen. G. J. Pillow, and was brevetted for gallantry at Cerro Gordo and Chapultepec. Resigning from the army in 1853, he took up his residence at Charleston, S. C. During the secession movement he was active in the military service of South Carolina, and took part in the siege of Fort Sumter. In May, 1862, he commanded a brigade in defence of Richmond, and he was wounded at the battle of Antietam. He returned to the defence of Charleston, and when that city was evacuated by the Confederates went again to Richmond. After the civil war he resided in Paris for some years, but subsequently engaged in business at Charleston. He died at New York city, March 26, 1887. His history of the *War with Mexico* (2 vols., 1849) is an excellent piece of work.

His uncle, **JAMES WOLFE RIPLEY** (1794-1870), general, was a native of Connecticut and graduate of West Point. He served in the war of 1812, the Seminole war of 1818, and the Mexican war. He was thereafter connected with the ordnance department until his retirement in 1863, having in August, 1861, been made chief of that department. In March, 1865, he received the brevet of major-general, and he died at Hartford, Conn., March 16, 1870.

RIPON, GEORGE FREDERICK SAMUEL ROBINSON, MARQUIS OF, was born in London, Oct. 24, 1827. He is the only son of the first Earl of Ripon, better known as Viscount Goderich, which title he held while prime minister for a few months in 1827. The marquis succeeded to his father's and uncle's titles in 1859, thus becoming Earl de Grey and Ripon, and in 1872 received his present title as an acknowledgment of his services as chairman of the High Joint Commission which arranged the Treaty of Washington in 1871. He had entered in diplomatic life as attaché at Brussels in 1849, and in 1852 was elected to parliament from Hull, but in the next year stood for Huddersfield and won that seat for the Liberals. In 1857 he was chosen from the West Riding of Yorkshire. In June, 1859, having entered the House of Lords, he was made under-secretary of war; in 1861, under-secretary for India; and in 1863, secretary of war. In 1866 he was made secretary of state for India, and in 1868 lord-president of the council, which office he resigned in August, 1873. In April, 1870, he was installed as grand-master of the Freemasons of England, but in September, 1874, he resigned without assigning any reason. But in a few days it became known that he had been admitted to the Roman Catholic Church at Brompton. When Mr. Gladstone returned to power in 1880, the Marquis of Ripon was appointed viceroy of India. The act called forth much animadversion. The new viceroy's admin-

istration was marked by an endeavor to extend the rights of the natives and to limit the privileges of Europeans. When he departed from India the Hindoo population of Bengal and Bombay testified their regard by extraordinary manifestations. In 1885, when Mr. Gladstone returned to power for a short time, Lord Ripon was made first lord of the admiralty. In 1882 he was chosen president of Yorkshire College, Leeds.

RISTORI, ADELAIDE, Italian tragic actress, was born at Cividale, in Friuli, in 1821. Her parents were actors and brought her on the stage when only four years old. Afterwards she was attached to a dramatic company at Turin and received instruction from Marchioni. At the age of fourteen she was allowed to act the part of Francesca da Rimini in Pellico's drama. In 1841 she removed to Parma, playing chiefly in comedy. In 1846, when she was married to the Marquis Giuliano del Grillo, she retired from the stage at the request of his family. But in 1849 she was induced to appear at Rome for the benefit of one of her former managers and created such a sensation that her relatives allowed her to follow her inclination. She now devoted herself to tragedy, and easily attained the foremost rank on the Italian stage. Her career was interrupted by the siege of Rome, and for a time she was busily employed as nurse in the hospitals. In 1855 she was called to Paris, where Rachel was at the zenith of her fame. Although the French actress bitterly resented the intrusion of the Italian, Ristori's splendid genius soon disarmed the national prejudice, and turned the current of popularity in her favor. For five years she appeared regularly for a season in the French capital. Legouve's *Medea*, written for Rachel, but refused by her, was translated into Italian for Ristori, and gave her a new triumph. She extended her tours to England, Germany, and Spain with equal success. She passed even to St. Petersburg, Alexandria, Athens, and Constantinople, winning fresh applause. In 1866 she crossed the Atlantic and reaped a rich harvest in the United States. She then visited South America. She played only in Italian, her chief characters being *Medea*, *Mary Stuart*, *Queen Elizabeth*, *Francesca da Rimini*, *Lady Macbeth*, *Adrienne Lecouvreur*. In 1873, after an extended and successful tour in the European capitals, she bade farewell to the English stage, but she visited the United States again in 1875. Later she took up the study of the English language, and in 1882 she appeared in London, and afterwards visited the United States again, acting *Lady Macbeth* and *Queen Elizabeth* in English. She is accomplished as an artist, and has the gift of beauty. Her moral character is above reproach, and she is an excellent mother.

RITCHIE, ANNA CORA MOWATT (1819-1870), actress, daughter of Samuel G. Ogden, a New York merchant, was born at Bordeaux, France, and spent her childhood in that vicinity. Soon after her removal to New York she made a runaway match with James Mowatt, a lawyer. Still a child in years, she was pardoned by her parents, and varied the instruction received from her husband with private theatricals and the composition of an epic poem which was published under the title *Polygo*. Then her husband lost his fortune in speculation and Mrs. Mowatt began to give public readings, though her friends strongly disapproved. Her husband became a publisher and failed again. Determining to try her fortune as an actress, she made her first appearance as Pauline, in *The Lady of Lyons*, in June, 1845. She also appeared in her own plays, *Fashion* and *Arnand*, and achieved success in England as well as America. After the death of her husband, in 1851, she returned to the United States, but continued her professional work until 1854, when she was married to William F. Ritchie. Her *Autobiography of an Actress* (1855) is a graceful narrative of her experience. In 1860 she went to Europe, residing at first on the continent, and afterwards near London, where she died July 28, 1870. Among her later

writings were some novels, *Two Roses* (1857) and *Italian Life and Legends* (1870).

RITCHIE, THOMAS (1778-1854), journalist, was born at Tappahannock, Va., Nov. 5, 1778. Deprived of his father at an early age, he received an academical education, studied medicine, and taught school, but in 1804 found his proper element in editing the *Richmond Enquirer*. During the forty years of his connection with it as editor and proprietor, it wielded great influence in the Democratic party. In 1845 Ritchie was called to Washington by Pres. Polk to edit the *Union*, as the organ of the administration. He then transferred the *Enquirer* to his sons, Thomas and William. In 1849 he returned to Richmond, and died there July 12, 1854. His son Thomas had died some weeks earlier, but William lived to fight in the Confederate army.

RITSCHL, ALBRECHT, German theologian, was born at Berlin, March 25, 1822. He was educated at the Universities of Bonn and Halle, and taught theology at the former from 1846 until 1864, when he was called to Göttingen, where he still remains. In his early works he belonged to the Tübingen school, but he afterwards took his position on the doctrines of the Lutheran Reformation. His characteristic work is *Die Christliche Lehre von der Rechtfertigung und Versöhnung* (3 vols., 1870-74), translated as *A Critical History of the Christian Doctrine of Justification and Reconciliation*. Other works are *Die Christliche Vollkommenheit* (1874); *Unterricht in der Christlichen Religion* (1875); *Ueber das Gewissen* (1876); *Theologie und Metaphysik* (1881); *Geschichte des Pietismus* (3 vols., 1880-86).

RITTER, FREDERIC LOUIS, musician, was born in Strassburg, Alsace, in 1834. He began the study of music under Hauser and Hans M. Schletterer, later had some instruction from Georges Kastner in Paris, and continued his studies in Germany. In 1852 he received the appointment of professor of music in the Protestant seminary of Fénéstrange, Lorraine, and later conducted a series of concerts at Bordeaux. About 1856 he came to the United States, settling at first in Cincinnati, where he advanced the cause of music in many ways. The Cecilia and Philharmonic societies were organized by him, and many works produced for the first time in America. In 1861 he removed to New York, and in 1867 was appointed professor of music at Vassar College, which position he still (1888) holds. His compositions include a number of instrumental works, many of which have been performed in New York, Boston, and other cities, by the principal orchestras and organizations for chamber-music, some sacred music, and a large number of German songs. He has gained distinction as a writer on musical topics, and is the author of *A History of Music in the Form of Lectures* (Boston, 1870-74; 2d ed., London, 1876); *Music in England* (New York, 1883); *Music in America* (1883); *Manual of Musical History, from the Epoch of Ancient Greece to the Present Time* (1886); and *Musical Dictation* (London, 1888). He edited also *The Realm of Tones* (New York, 1883), and published a *Practical Method for the Instruction of Chorus Classes*, and, with Rev. J. R. Kendrick, *The Woman's College Hymnal* (Boston, 1887). The degree of doctor of music was conferred on him by the University of New York in 1878. He has contributed to this work on "Music in America."

His wife, **FANNY RAYMOND RITTER**, has become well known through her pamphlets on musical subjects: *Woman as a Musician* (New York, 1877); *Some Famous Songs* (London, 1878); *Troubadours and Minnesingers*; *Haydn's "Seasons"* (Poughkeepsie, 1881); and *Madrigals* (1882). She has also written a volume of poems, *Songs and Ballads* (New York, 1888), and has translated Louis Ehler's *Letters on Music to a Lady* (London, 1877), and Robert Schumann's *Music and Musicians* (London, 1877).

(F. L. W.)

RIVES, WILLIAM CABELL (1793-1868), senator and diplomatist, was born in Nelson co., Va., May 4, 1793. His grandfather, William Cabell (1730-98), was noted as a patriot during the Revolution. Rives graduated at William and Mary College, and studied law with Thomas Jefferson. He volunteered in the defence of Virginia during the British invasion in 1814-15, and was a member of the State constitutional convention in 1816. After service in the State Legislature, and in Congress from 1823 to 1829, he was sent as U. S. minister to France. After his return he was U. S. senator until 1845; was sent again to France in 1849. Retiring then from public life he devoted his leisure to his *Life and Times of James Madison*, of which three volumes were published (1859-69), but the valuable work was never completed. In February, 1861, Rives was member of the peace conference at Washington, but two months later he attended the Confederate Congress. He died near Charlottesville, Va., April 26, 1868. He had published a *Life of John Hampden* (1845), *Ethics of Christianity* (1855), and some minor works. His wife wrote a narrative of her *Residence in Europe* (1842), and other books.

His granddaughter, **AMÉLIE RIVES CHANLER**, author, was born at Richmond, Va., Aug. 23, 1863, and educated by private tutors. She was married in June, 1888, to John Armstrong Chanler, of New York city. She had already become noted by some short stories and poems, and a novel, *The Quick or the Dead* (1888). Her productions have been sharply criticised as both in style and contents a startling mixture of the recondite and sensational.

RIVES, JOHN CABELL (1796-1864), journalist, was born in Kentucky and received but slight education. He became cashier of a bank at Edwardsville, Ill., and in 1824 was appointed clerk in a government office at Washington. He joined Francis P. Blair in founding the *Congressional Globe* for the support of Pres. Jackson's administration. After Pres. Polk established the *Union* as his organ Rives became the sole proprietor of his paper. He introduced the practice of full reports of Congressional proceedings. During the civil war he was liberal in contributions for the cause of the Union. He died near Georgetown, D. C., April 10, 1864.

RIVIERE, BRITON, English painter, was born in London, Aug. 14, 1840. His first studies were pursued under his father, who was a drawing-master in London and Oxford, and he afterwards entered the University of Oxford, and graduated B. A. in 1867. As early as 1858 he had exhibited rural scenes at the National Academy, and among his later pictures are, *Strayed from the Flock* (1866); *The Long Sleep* (1866); *A Midsummer Night's Dream* (1870); *Circe Transforming the Friends of Ulysses* (1871); *Argus* (1873); *Genius Loci* (1874). He had now become recognized as especially successful in pictures of animals, and many of his works have been made familiar by engravings. Among his later works are, *An Anxious Moment* (1878), representing a flock of geese frightened at a hat on the ground; *The Poacher's Widow* (1879); *A Roman Holiday* (1881); *Old Playfellows* (1883); *Actæon* (1884); *The King and his Satellites* (1884); *The Sheepstealer* (1885); *Stolen Kisses* (1886).

RIVINGTON, JAMES (1724-1802), Tory, was born in London, and became a bookseller there. In 1760 he removed to Philadelphia, but soon settled in New York. The *Gazetteer*, which he founded April 22, 1773, was a bitter opponent of the patriotic movements, and on Nov. 23, 1775, the "Sons of Liberty" destroyed its press and melted its type into bullets. Rivington, who had been sent to jail by the Congress, on his release went to England and obtained appointment as King's printer for New York. Returning he commenced in October, 1777, to publish the *Loyal Gazette*, or, as he afterwards called it, the *Royal Gazette*. In 1781, deeming the British cause hopeless,

he began to furnish secret information to Gen. Washington, and after the close of the war he again changed the title of his *Gazette*, but was soon obliged to suspend its publication. He died in New York in July, 1802.

ROACH, JOHN (1815-1887), shipbuilder, was born at Mitchellstown, Ireland, in 1815, and in 1829 emigrated to America. Getting employment in iron-works he became a machinist, and then started a foundry, which afterwards became known as the *Ætna Iron-works*. The demands of the civil war gave him splendid opportunities, and he constructed many large engines. Enlarging his own works, and purchasing others, he engaged largely in construction of iron vessels. In 1871 he purchased shipyards at Chester, Pa., and established the Delaware River iron-shipbuilding and engine-works, which covered 120 acres, while the plant was valued at \$2,000,000. Here he built 63 large vessels for the U. S. government, and for leading steamship lines. When the navy department, in 1885, by a strict construction of contract, refused to accept the despatch-boat *Dolphin* as being too slow, Roach made an assignment, and closed his works. The trouble affected his health, and he died at New York, Jan. 10, 1887. The vessel was subsequently accepted and the works reopened.

ROANOKE COLLEGE is an institution of learning at Salem, Roanoke co., Va. Salem is a town of 2500 inhabitants, on the line of the Norfolk and Western Railroad, 240 miles from Washington and 60 miles from Lynchburg. The Roanoke Valley, in which the college is situated, lies between the Allegheny and Blue Ridge at an average elevation of 1100 feet above the sea-level, and is noted for the fertility of its soil, the healthfulness of its climate, and the picturesque beauty of its scenery.

The germ of Roanoke College was the Virginia Institute, established in 1842 at Mount Tabor, Augusta co., Va. This institution was removed to Salem in 1847, Rev. C. C. Baughman being principal. In 1853 it was chartered by the Legislature of Virginia as Roanoke College. Rev. David F. Bittle, D. D., was elected first president, and served with untiring energy for 23 years. Rev. Thomas W. Dosh, D. D., served as president during the sessions of 1877-78. Since that year the present incumbent, Julius D. Dreher, A. M., Ph. D., a graduate of the college (class of '71), has held the office. Prof. S. C. Wells, A. M., Ph. D., senior member of the faculty, dates his connection with the institution to the year 1849, when he was elected first assistant teacher in the Virginia Collegiate Institute. Rev. Wm. B. Youce, A. M., Ph. D., next oldest professor, was elected tutor in 1854. The college owns 20 acres of land well situated in Salem, the campus proper being very attractive. There are four large brick buildings for college purposes, the entire front being 313 feet. A separate building—Bittle Memorial Hall—was erected in 1879 for the accommodation of the library, which now contains 16,000 volumes, including many rare and valuable works. The college owns a collection of more than 12,000 mineralogical and geological specimens, a numismatic cabinet, and valuable chemical and philosophical apparatus.

The board of trustees has power to hold property, elect professors, prescribe courses of study, and confer degrees. The college offers to candidates for degrees a choice among the following courses of study: 1. Ancient classical course, with degree of Bachelor of Arts. 2. Modern classical course, with degree of Bachelor of Arts. 3. Scientific course, with degree of Bachelor of Science. In these courses the instruction is thorough and practical. In mathematics, students have practical field-work, and learn the use of instruments; in chemistry and natural philosophy there are frequent experiments; in geology, excursions. French and German are spoken in the classroom. The course in both French and German extends through three years.

The college was in operation throughout the war, but up to 1865 had graduated only 41 men. Its main results have been accomplished almost entirely within a later period, under many disadvantages, and with very inadequate means. The whole number of graduates is now nearly 300, the majority of whom are engaged as professors, teachers, clergymen, lawyers, and physicians. Graduates of the college may be found in 28 States and Territories, and in two foreign countries. Many students at the South pursue only a partial course at college; of this class Roanoke has received fully 1500. The college draws its students from nearly every Southern State, and from some parts of the North and West. The first Mexican to complete the course of study received his diploma in the class of 1888. For 18 years Roanoke has been educating Indians. The Choctaws support a small number of students at the college at the expense of their government. Three Choctaw superintendents of schools have visited the college in the discharge of their official duties. In 1883 Wm. H. McKinney graduated at Roanoke with the degree of A. B., being the first Indian to take a diploma at a Virginia college, and also the first one to win that honor at Yale University, where he was made a bachelor of divinity in 1886. The number of students in attendance in 1888-89 is nearly 150, coming from 14 States, Indian Territory and Japan. The students maintain two excellent literary societies. There is also an alumni association composed of the graduates. A General Reunion Association embracing former students, as well as graduates, holds triennial reunions at the college during commencement week. The college has always been noted for its high moral tone and its positive but not sectarian religious character. An active Young Men's Christian Association exerts a strong influence on the moral life of the college. Candidates for the ministry and sons of clergymen pay only half the regular tuition fee. The entire expenses of a student for a session of nine months range from \$150 to \$205. The faculty endeavor to aid young men of small means in availing themselves of the advantages afforded by the college. The *Roanoke Collegian*, the organ of the graduates and students, is published monthly during the session. Prof. F. V. N. Painter, A. M., of the faculty, has published a *History of Education* (1885). (J. H. D.)

ROBBINS, THOMAS (1777-1856), antiquary, was born at Norfolk, Conn., Aug. 11, 1777. He was of a family which contained many Puritan preachers of local note. He graduated at Yale College in 1796 and was pastor successively at East Windsor, Stamford, and Rochester, Mass. In 1842 he took up his residence at Hartford and founded the Connecticut Historical Society, to which he bequeathed his valuable library. An early series of articles from his pen was collected under the title *First Planters of New England* (1815). He also published *View of all Religions* (1824) and some other works. He died at Colebrook, Conn., Sept. 13, 1856. A bulky biography of him was published (1887).

ROBERTS, BENJAMIN STONE (1811-1875), general, was born at Manchester, Vt., graduated at West Point in 1835, and was first lieutenant of dragoons when he resigned in 1839 to become railroad engineer in Northern New York. He was afterwards assistant geologist of that State and in 1842 went to Russia to assist in railroad construction. In 1843 he settled in Iowa and engaged in the practice of law, but the outbreak of the Mexican war called him to arms again. He was made first lieutenant of mounted rifles, and distinguished himself at Chapultepec and Matamoros. He was a major of cavalry serving in New Mexico when the civil war broke out and soon was engaged in defending Fort Craig against Texans under Sibley. In June, 1862, he went to Washington and was made brigadier-general and chief of cavalry in Gen. Pope's army. With that commander he was afterwards sent to Minnesota, but in June, 1864, he had command of

a division in Louisiana, and afterwards in West Tennessee. He retired from the army in July, 1866, and died at Washington, Jan. 29, 1875.

ROBERTSON, JAMES (1742-1814), pioneer, was born in Brunswick co., Va., June 28, 1742, and was brought up on his father's farm. In 1759 he accompanied Daniel Boone on his third expedition across the Alleghenies and discovered the Watauga Valley. Next spring he led a band of settlers there and arranged with the Cherokees a treaty on terms of which the whites and natives lived at peace till 1776. Troubles then broke out, but Robertson succeeded in subjugating the red men, and, at the instance of the governor of North Carolina, took up his residence at their capital in order to keep them in check. In 1779 he removed with a number of the Watauga settlers to the region of the Cumberland, where on Christmas of that year they founded Nashville, and organized themselves into a civil and military body with Robertson at their head. Their conflicts with the savages who swarmed around them were almost incessant. In 1781 the fort of Nashville was besieged by 1000 Indians and Robertson's life was saved by his wife. Notwithstanding severe losses by the tomahawk and desertion, Robertson maintained the settlement. During the Revolutionary war he supported the patriot cause, and on being later urged by the Spaniards, with the promise of many advantages, to establish an independent government west of the Alleghenies, he refused their offer. In 1790 he was made by Washington a brigadier-general and, as such, commanded the Tennessee militia. During his later years he was U. S. agent to the Chickasaw Indians, and died at the Chickasaw Agency, Tenn., Sept. 1, 1814. See A. W. Putnam's *Life and Times of Robertson* (1859), and J. R. Gilmore's *Advance-Guard of Western Civilization* (1888).

ROBIN, CHARLES PHILIPPE (1820-1885), French physician and naturalist, was born at Jasseron, June 4, 1820. He studied medicine at Paris and in 1845 was employed in an exploration of the coasts of Normandy and Jersey for enriching the museum of natural history and comparative anatomy in the Paris École Pratique de Médecine. He obtained the doctor's degree in 1847, and was made professor of histology in 1862. His works relate to comparative anatomy, physiological chemistry, and parasitism. With M. Littré he thoroughly revised Nysten's *Dictionnaire de Médecine*. With M. Verdeil he published *Histoire Naturelle de Végétaux Parasites* (3 vols., 1853). Among his other works are *Les Substances Organisées* (1866); *Les Humeurs du Corps de l'Homme* (1867); *Anatomie Microscopique* (1868). In 1871 he assisted in founding a sociological society.

ROBINSON, EZEKIEL GILMAN, President of Brown University, was born at Attleborough, Mass., March 23, 1815. He graduated at Brown University in 1838 and at Newton Theological Institution in 1842. He was ordained pastor of the Baptist church in Norfolk, Va., in 1842, and in 1846 was called to the theological seminary at Covington, Ky., as professor of Hebrew. He afterwards had charge of a church in Cincinnati, but in 1852 was made professor of Biblical theology in the Baptist Seminary at Rochester, N. Y., of which he became president in 1860. While holding this position he was also editor of the *Christian Review* for six years. Since 1872 he has filled with ability the presidency of Brown University.

ROBINSON, HENRY CRABB (1775-1869), best known by his entertaining *Diary and Correspondence*, published posthumously, was born at Bury St. Edmund's, England, May 13, 1775. He studied law and at the age of twenty-five went to Germany, where besides attending some of the principal universities he associated with the most eminent literary men, including Goethe and Schiller. When the Peninsular war began in 1808 Robinson wrote letters from Spain to the *London Times*, and afterwards in England was

an editorial contributor. At the age of thirty-eight he was called to the bar and for fifteen years practised his profession with diligence and success. In later life he was active in promoting the London University and other institutions for the benefit of art and literature. His *Diary and Correspondence* (1869) is filled with pleasant gossip and graphic sketches of prominent men with whom he came in contact. He died at London, Feb. 5, 1867.

ROBINSON, STUART (1816-1881), Presbyterian minister, was born at Strabane, Ireland, Nov. 26, 1816, but in early life he was brought to America. After graduating at Amherst College in 1836, he studied theology at Union Seminary, Va., and at Princeton. He held pastorates in Virginia, Kentucky, and Baltimore and edited the *Presbyterial Critic*, in which he maintained High Church views of Presbyterian polity and doctrine. In 1856 he was called to the Danville Theological Seminary as professor of ecclesiology, but in 1858 he removed to Louisville, where he edited the *True Presbyterian* and also ministered to a church. During the civil war his paper was suppressed by the Union authorities, but it was afterwards allowed to appear under the name *Free Christian Commonwealth*. He was the leader of the Louisville Presbytery and in 1866 was expelled from the General Assembly which met at St. Louis for signing the "Declaration and Testimony," which censured that body for making political deliverances. He afterwards induced the Synod of Kentucky to withdraw from the Northern Church and join the Southern. In 1869 he was elected moderator of the Southern General Assembly by acclamation. He died at Louisville, October 5, 1881. His most important works are *The Church of God* (1858), and *Discourses of Redemption* (1866). Several of his pamphlets related to controversies between the Northern and Southern Presbyterians.

ROBY, HENRY JOHN, an English educator, was born at Tamworth, Aug. 12, 1830. He was educated at Bridgnorth and at St. John's College, Cambridge, graduating in 1853, and being made fellow of the college in 1854, and tutor in 1855. He took part in the movement for university reform and published a pamphlet on the subject. In 1861 he was made under-master of Dulwich College Upper School, and in 1866 professor of jurisprudence at University College, London. He was appointed secretary of the schools inquiry commission in 1864, and to the endowed schools commission in 1869, and was a member of the latter 1872-74. He has since been engaged in business at Manchester. Besides preparing the *Report of the commissioners* and editing several volumes connected with it, he published an excellent *Grammar of the Latin Language, from Plautus to Suetonius* (2 vols., 1871-74).

ROCHAMBEAU, JEAN BAPTISTE DONATIEN VIMEUR, COMTE DE (1725-1807), a French general noted for his services in the American Revolution, was born at Vendôme, July 1, 1725. Entering the army at the age of sixteen, he served in Germany under Marshal Broglie and in 1745 became aide to the Duke of Orleans. He had reached the grade of lieutenant-general when in 1780 he was sent with 6000 men to the United States. He arrived at Newport in July and after fortifying Rhode Island he acted in concert with Washington against Clinton in New York. In the next year he went to Virginia and rendered important service, resulting in the capture of Cornwallis at Yorktown, Oct. 19, 1781. Two captured cannons were presented to Rochambeau. Returning to France he received the decoration of Saint Esprit, and was made governor of Picardy and Artois. In 1791 he was made a marshal of France, but his conduct in command of the Army of the North disappointed public expectation and he narrowly escaped the guillotine. Thenceforth he lived in retirement, but Bonaparte in 1804 conferred on him a pension and the grand cross of the Legion of Honor. He died May 10, 1807. His *Me-*

moirs were published in 1809 and translated into English in 1838.

His son, DONATIEN MARIE JOSEPH DE VIMEUR, VICOMTE DE ROCHAMBEAU (1750-1813), became a general in the French service and was chiefly employed in Santo Domingo, of which he became governor in 1802. On his return voyage in the next year he was captured by the English and remained prisoner nearly eight years. He was killed at the battle of Leipsic, Oct. 18, 1813.

ROCHEFORT, HENRI, French journalist and politician, discards the title "Marquis de Rochefort-Luçay" to which his birth entitled him. He was born at Paris, Jan. 30, 1830, and early adopted the republican views of his mother rather than those of his royalist father. Before devoting himself to journalism he had studied medicine and had been in employ of the municipality of Paris. He also composed many popular plays and vaudevilles, as his father had done before him. To the journals of Paris he contributed for some years art and dramatic criticisms and social sketches. While connected with the *Figaro* he gradually turned from social topics to caustic satire of the imperial administration. These sketches were collected into three volumes, *Les Français de la décadence* (1866-8). Obligated to leave the *Figaro*, Rochefort founded the famous *Lanterne*, of whose first number 80,000 copies were issued. After eleven weekly numbers had been published, the proprietor was brought before the tribunals, and sentenced to fine and a year's imprisonment. But he had fled to Belgium, where he continued to edit the offensive paper, which was still circulated in France in spite of vigorous efforts of the police for its suppression. In 1869 he was twice a candidate for the Chamber of Deputies, and having been elected he braved the sentence of imprisonment and proceeded to Paris. Napoleon III. granted him a safe-conduct, which Rochefort accepted, though many of his supporters had hoped for a collision with the authorities. He now founded *La Marseillaise*, whose attacks on the imperial family provoked Prince Pierre Bonaparte to kill Victor Noir, one of Rochefort's assistants. In January, 1870, the journal was seized and the proprietor was sentenced to six months' imprisonment. The catastrophe of Sedan restored him to liberty and gave him a place in the government of national defence. He kept aloof from the Communists, but tried to induce the government to make some concessions to them. When this was not done he resigned his office, though he still had charge of the barricades. In February, 1871, he founded *Le Mot d'Ordre*, and was elected deputy. He instigated some of the worst excesses and outrages of the Communists. Arrested at Meaux, May 20, he was sent to Versailles for trial, and in September was condemned to imprisonment in a fortress. Victor Hugo interceded for him with Pres. Thiers, but in vain. His friends declared that his mind was shattered and his death at hand. He was permitted to leave the prison in order to be married to Mlle. Renaud, who had borne him several children. In 1873 he was transported to New Caledonia, but some months later he escaped to an American vessel and was taken to San Francisco. Thence he made his way to Geneva, where he resided until the general amnesty of 1880 permitted his return to Paris. There he established in opposition to Garibaldi's policy of opportunism a new journal, *L'Intransigeant*. In recent years less attention has been paid to his utterances on public questions.

ROCHESTER, a city of Minnesota, county-seat of Olmsted co., is on the Winona and St. Peter Railroad, 75 miles S. E. of St. Paul. It is also on the Zumbro River, which is spanned by three iron bridges, and furnishes water-power for three flour-mills. Cockle-separators (see Vol. III, p. 95) are manufactured here, as well as wagons, furniture, and agricultural implements. There are also several foundries. The largest building is the Insane Hospital, erected at a cost of \$325,000,

and having capacity for 700 patients. Besides the city high-school, which cost \$75,000, there are other schools, including a Roman Catholic seminary. The total valuation of property is \$1,750,000 and there is a public debt of \$18,000. The city was incorporated in 1858. In 1883 a destructive cyclone levelled the lower town, causing the death of 27 persons. That portion of the city has since been rebuilt. The population by the State census of 1885 was 5313.

ROCHESTER, a flourishing city of New York, the seat of Monroe co., is on both banks of the Genesee River, 7 miles from Lake Ontario. The city is about 250 ft. above the level of Lake Ontario, and the river has here three falls, of 96 ft., 26 ft., and 83 ft., respectively, which afford immense water-power, abundantly utilized in all kinds of manufactures. At the Upper fall the New York Central Railroad crosses the city, and it has here three branches. The other main railroads are the Erie; the Buffalo, Rochester, and Pittsburg; the Buffalo, New York, and Philadelphia; the West Shore; and the Rome, Watertown, and Ogdensburg. There are short roads to Lake Ontario and to Brighton River. The Erie Canal crosses the river by a stone aqueduct, 850 ft. in length, and supported by 7 arches. Among the public buildings are the city-hall, court-house, which are also surrounded by buildings of fine architecture. There are also the spacious city-hospital, St. Mary's Hospital, county-jail, arsenal. Among the 75 churches are several of fine architecture, including the First Baptist, First Presbyterian, St. Peter's, and the Roman Catholic Cathedral. There are many charitable institutions, including orphan asylums, homes for the friendless, and church homes. The University of Rochester, which is under control of the Baptist denomination, has handsome buildings and grounds, comprising 23 acres. The Baptist Theological Seminary has a fine 4-story brick building. The public school system comprises 31 schools of various grades, including the Free Academy. There are also 44 private and parochial schools, the chief of which is St. Andrew's Seminary. A public library connected with the public schools, the Athenæum, has a large library and reading-room, and the Law Library in the court-house is of great value. The State has a House of Refuge for juvenile delinquents, there being separate buildings for males and females. The grounds cover 42 acres and there are accommodations for 500 boys and 200 girls. The object of this institution is to reform the inmates and train them in morality and industry. Near the city are also Monroe county penitentiary, the almshouse, and insane asylum, which have well-constructed buildings.

The city has an excellent supply of water for drinking and fire purposes. It is derived partly from the river and partly from Hemlock Lakes, nearly 30 miles south. The receiving reservoir has a capacity of 85,000,000 gallons, and the distributing reservoir a capacity of 45,000,000. There are two gas companies, one on each side of the river. There are 9 hotels, 3 national banks, 8 other banks, 7 daily and 4 weekly newspapers. The leading industry during the most of the city's history was flour manufacture, and this is still extensively carried on. There are 11 iron-foundries, iron-bridge-works, cotton-factories, and manufactories of clothing, boots and shoes, furniture, cigars and tobacco, India-rubber goods, carriages, glass, perfumery, agricultural machinery, steam-engines, etc. There are large breweries, fruit-canning establishments. Coal is largely distributed from this port to other places on the Lakes. The fertility of the Genesee Valley has greatly contributed to the prosperity of Rochester, and the nursery business is extensively carried on. The city was settled about 1810, and incorporated in 1832. Its property is valued at \$75,514,275; the public debt is \$5,515,000, and the expenses for the year 1886 were \$1,123,460. The population in 1880 was 89,366.

ROCHESTER, UNIVERSITY OF. The movement to establish a University at Rochester originated

with prominent Baptists of the State of New York, and first took definite shape in an effort to remove Madison University from Hamilton, N. Y., to Rochester. An organization was first effected Sept. 16, 1850, under a provisional charter granted by the Board of Regents, at which time the trustees elected the usual officers, appointed an executive committee consisting of 9 members of their own body, created 6 professorships, and adopted a course of instruction. No president was elected. The actual work of instruction began on the first Monday in November, 1850. The first catalogue reported 8 instructors and 71 students. In July, 1851, a class of 10 was graduated. On Feb. 14, 1851, a permanent charter had been granted by the Regents which vested the control of the institution in a self-perpetuating Board of Trustees—24 in number—holding office for life, and which conferred upon the institution "all the privileges and powers conceded to any college in this State."

The executive duties of the president were performed by Dr. A. C. Kendrick, the eminent Greek scholar and exegete, who had been elected to the chair of the Greek language and literature. Coming from Madison University with a reputation already established, he gave to Rochester for over thirty years the full strength of his splendid powers, and, with the exception of Pres. Anderson, has been more completely identified with the history of the University than any other member of its faculty. On April 6, 1853, Martin B. Anderson, of New York, then editor of the *New York Recorder*, the leading paper of the Baptist denomination, was elected president of the institution, and entered upon his duties in the fall of the same year. To no one man does the University of Rochester owe so much as to Pres. Anderson. His moulding and shaping influence has been constant and pre-eminent in all the factors of substantial growth, notably in the development, expansion, and organization of the course of study, methods of instruction and discipline, and the characteristic features referred to below.

One of the most potent influences in determining the organization and location of the institution was the fact that the wealthy and populous district known as Western New York, with a population as early as 1850 of half a million, was at that time almost wholly wanting in facilities for higher education. This region contains the immediate constituency of the University; but it has always drawn a considerable percentage of its students from the country at large, and its last catalogue (1887-88) shows that 11 States and Territories, as well as Germany and England, are represented among its students.

The founders of the University acted from the deep-seated conviction that higher education should be distinctively Christian—carried on under influences which would tend to develop and strengthen the moral and religious life. Most of them were Baptists, and this denomination has always controlled the institution, 20 out of 24 members of the first Board of Trustees being connected with it. The movement was, however, not sectarian in any exclusive sense. From the first, the enterprise enlisted the hearty and effective co-operation of eminent citizens of other denominations, and such have been among its most munificent benefactors. Its spirit, management, and instruction have been entirely free from sectarian influence. Other denominations are liberally represented in its board of trustees and faculty of instruction, while students of all faiths, including Catholics and Jews, freely avail themselves of its privileges.

The limits of this article forbid any but the briefest reference to its numerous benefactors. The list of those who have contributed \$5000 or upward to its various purposes includes over 30 names. A much larger number have given smaller sums, while many have given business or professional services invaluable to the institution. Full information regarding the men who have founded, endowed, and administered

the institution may be found in Gilmore's *Outline History of the University of Rochester*.

The University has been characterized by steady growth in all the features which give strength and stability to such an institution. It began its work in 1850 in rented quarters in an old hotel. It now owns a beautiful campus of 23 acres on which are situated 3 large, costly buildings, amply providing for a library of over 23,000 volumes, one of the best and most complete geological and mineralogical collections in the country, consisting of over 40,000 specimens, chapel and lecture-rooms, and a chemical laboratory new and complete in all its appointments. The value of property and endowment has grown from \$13,000, the amount raised at the organization of the University, to very nearly \$1,000,000. The faculty has been nearly doubled in numbers and now consists of 12 members, while the courses of instruction have been more than doubled in scope.

There are several features which distinguish the University of Rochester from most other colleges and some which are peculiar to it. Among the former may be mentioned the absence of dormitories, which are rendered entirely unnecessary by the ample accommodations furnished to the students in private families. Among the former is a system of "Honor courses," which include a wide range of studies supplementing and extending the regular curriculum, and designed to develop to the utmost the capacity for independent study and investigation. They are open to all students who attain a certain standing in the regular course. In most of them regular instruction is given, and they all terminate in a written examination, entitling the student to honorable mention, if successfully passed. Another feature consists in Saturday morning lectures, affording every student supplementary instruction for one hour per week throughout the course, and including elocution and composition, the Greek, Roman, French, and German literatures, historical geography, comparative philology, chemical physics, embryology, sanitary science, and history of art and principles of æsthetic criticism.

Pres. Anderson introduced at the beginning of his administration a feature which he called "chapel talks," consisting in the brief discussion before the whole body of students of questions suggested by the events of the day, especially with a view to pointing out their significance, and exhibiting the historical, social, and ethical principles involved.

The University of Rochester exists primarily to give, under Christian influences, that general and liberal culture which is felt to be essential to the highest success in life, and to be the best preparation for special and professional study. In the establishment and modification of the curriculum, therefore, the aim has been to secure a natural, logical order of studies; thorough, continuous discipline; and the greatest possible symmetry of culture by grounding the student in the fundamental principles of all the great departments of human knowledge. Election of studies is permitted to a limited extent in the junior and senior years, and even earlier when such election will not interfere with the objects above mentioned. Of the scope of instruction Pres. Anderson says: "The organic law of the University is such as to give free play to all the elements in education which modern progress has developed. In our curriculum we have retained the studies which the world's experience has tried and proved, and welcomed all new subjects whose promise justified trial;" and he has further defined the end which the institution seeks to attain for the student as: "The foundation of correct moral and intellectual habits through the scientific comprehension of specimen portions of the field of organized knowledge."

Of these Pres. Anderson says: "The true aim of the teacher is to give breadth, culture, elevation, and power to the minds of his pupils. This aim we have set before ourselves in this institution. Each instructor

is expected to bring before his classes the results of original thought and independent investigation, and instead of a mere *memoriter* recitation, the student is trained and encouraged to raise questions and suggest difficulties. We have sought to make our instruction at once historical, comparative, scientific, practical, and personal."

The alumni of the university now number about one thousand, and nearly as many more have taken partial courses. Of the alumni over 200 have entered the Christian ministry, about 160 have studied law, 30 have studied medicine, 12 have become journalists, while more than one hundred have made teaching their life-work. Of the teachers, above 50 per cent. have become professors in or presidents of colleges or professional schools.

At the close of the college year 1887-8 Rev. M. B. Anderson, D. D., retired from his work as president, and Rev. David J. Hill, D. D., LL. D., who had already discharged with conspicuous ability the duties of president in the Bucknell University, Lewisburg, Pa., was chosen his successor. (G. M. F.)

ROCKFISH, the common name given to *Roccus lineatus*, a member of the family *Percidae*, which is known also as the Striped Bass, and extends from the Gulf of St. Lawrence to the Gulf of Mexico. From the New Jersey coast northward it bears the name of striped bass, but is called rockfish in the Delaware River and southward. It is a strong, active, and voracious fish, which annually ascends the rivers to spawn, and remains in them through a considerable portion of the season. It is non-migratory, being found on the coast summer and winter, and caught in all the rivers of the Eastern United States. Great numbers are taken during the winter in Chesapeake Bay and its tributaries. In the rivers of New Brunswick it is taken in abundance in the winter by spearing through the ice.

At the time of the spring run of the shad the rivers are well supplied with rockfish, which are then plump and well fed, preying on the small river fishes. The rockfish is said to lay as many as 2,250,000 eggs. The young grow very rapidly, the mature fish attaining a weight of 20 lbs., though individuals of 50 lbs. have been caught, and there is record of one weighing 112 lbs. The rock is one of our most valuable food-fishes, the flesh being firm and of fine flavor. As a game-fish it ranks next to the salmon in popularity. It was formerly very abundant in the waters of Cape Cod Bay, but has been greatly reduced there, though not evidently so farther south, from which region great quantities are annually sent to market. It is taken largely in the shad seines in the spring. It was introduced by the U. S. Fish Commission into the waters of California some years ago. A related species, *R. labrax*, is an important European fish. There are three other North American species of *Roccus*, of which *R. Americanus*, the white perch, is a favorite pan or frying fish.

Fishes of several other families are known as rockfish, this name being given in Bermuda to all the species of the subgenus *Mycteroperca*, which are large and important food-fish. The log perch, *Percina caprodes*, little perch-like fresh-water fishes, are also known as rockfish. On the Pacific coast fishes of the family *Scorpenidae* are commonly known as rockfish and rock-cod. They are enormously abundant, of large size and brilliant color, and are caught largely, all the species being excellent food-fish. In average size they are about 15 inches long, and 2 or 3 lbs. weight, and their rich and attractive hues give great brilliancy of color to the San Francisco fish-stalls. (C. M.)

ROCKFORD, a city of Illinois, the seat of Winnebago co., is on both sides of Rock River, 91 miles W. of Chicago, on branches of the Chicago, Burlington, and Quincy, the Chicago, Milwaukee, and St. Paul, the Chicago and Northwestern, and the Illinois Central Railroads. Three railroad bridges and one wagon

bridge cross the river. The principal buildings are the court-house and other county buildings, opera-house, and high-school. There are 7 hotels, 4 national banks, 1 private bank, 2 daily and 4 weekly newspapers, 20 churches, 12 schools, a female seminary, and a business college. The industrial works comprise 2 flouring-, 2 paper-, 1 woollen-, and 1 cotton-mill, and many factories, producing agricultural implements, boots and shoes, furniture, watches, silver-plated ware, cutlery, bolts, churns, carriages, pumps, culinary extracts, wood-engravings, knit-goods, clothing, and soap. The city is well built, has wide, well-shaded streets, and two parks. It is lighted with gas and electric light, and is supplied with water by the Holley system. It was settled in 1834, and in 1880 had 13,129 inhabitants, while the State census of 1886 gave 19,420.

ROCK ISLAND, a city of Illinois, seat of justice of Rock Island co., is on the Mississippi River, nearly 3 miles above the mouth of the Rock River. It is 181 miles west of Chicago. A fine wrought-iron bridge, built by the U. S. government in 1870, at a cost of \$1,300,000, connects Rock Island with Davenport, Iowa. On the island which gives name to the city the government has erected a vast armory and arsenal, and expended large sums of money in its improvement. The navigable channel of the river is west of the island, while that on the east has been dammed, and furnishes immense water-power. The city has a court-house, 3 national banks, 20 churches, a high-school and other schools, and is the seat of Augustana College, which is under the patronage of Swedish Lutherans. The industrial works comprise saw-mills, flour-mills, machine-shops, stove-foundries, glass-works, and other manufacturing. The city was incorporated in 1849, and in 1880 it had 11,659 inhabitants.

ROCKLAND, a city of Maine, is on the west side of Penobscot Bay, 10 miles from the ocean, and 60 miles E. N. E. of Portland, with which it has railroad connection. It has a U. S. government building of granite, a court-house of brick and granite, 2 national banks and other banks, 10 churches, graded schools, a public library, and 3 weekly newspapers. The water-supply is from a lake, 2½ miles distant. Rockland has an iron-foundry, brass-foundry, and minor manufactures. The chief articles of export are lime and granite, the latter being obtained from the neighboring islands. The town was incorporated in 1848, and received a city charter in 1854. Its population in 1880 was 7599.

ROCKVILLE, a manufacturing village of Tolland co., Conn., is on the New York and New England Railroad, 17 miles N. E. of Hartford, and 4 miles from Vernon, from which a branch road runs. Hockanum River, the outlet of Snipsic Lake, gives abundant water-power, having here a fall of 280 feet. There are 5 woollen-mills, and factories producing cotton goods, spool-silk, and stockinets. There are 3 hotels, an opera-house, 2 national banks, 2 savings banks, 8 churches, a high-school and other public schools, and 2 weekly newspapers. It is lighted with gas, and supplied with water by aqueduct from the lake. It is part of the town of Vernon, which was organized in 1808. Its first church was built in 1838. Its population in 1880 was 5902.

RODES, ROBERT EMMETT (1826-1864), Confederate general, was born at Lynchburg, Va., March 29, 1826. He graduated at the Virginia Military Institute in 1848, and was afterwards made instructor there. He went to Mobile, Ala., early in 1861, to become captain of cadets, and on the outbreak of the civil war was made colonel of the Fifth Alabama regiment. He was soon promoted to brigadier-general, and in 1862 was wounded at Seven Pines and at Antietam (Sharpsburg). He fought also at Fredericksburg and Chancellorsville, gaining at the latter his promotion to a major-generalship. He fought at Gettysburg, and was afterwards with Gen. Jubal A. Early in the Shenan-

doah Valley. He was killed in battle at Winchester, Va., Sept. 19, 1864.

RODGERS, JOHN (1771-1838), commodore, was born at Havre de Grace, Md., July 11, 1771, and entered the U. S. navy in 1798 as lieutenant. He was with Com. Truxton on the *Constellation*, when he captured the French frigate *L'Insurgente* in February, 1799. Being then made captain, he cruised in the West Indies, and in 1802 went to the Mediterranean. In June, 1803, he made a successful attack on the Tripolitan fleet, and in 1804 had command of the Congress (38 guns). In 1805 he succeeded to the command of the fleet, and brought the wars with Tripoli and Tunis to a close. In 1811, while commanding the President, a 44-gun ship, he engaged in pursuit of a British vessel which had impressed an American sailor off Sandy Hook. On his coming up with the *Little Belt* (22 guns), Capt. Bingham, an engagement ensued, in which the British vessel was crippled. The two captains give varying accounts of the origin and progress of the fight. Although war between the two nations was averted for a time, the action greatly increased the hostile feeling. At last, in June, 1812, Rodgers sailed from New York in command of a squadron, but two days later, while he was chasing a British frigate, a gun burst, wounding him and others, and killing some. In the same year he captured some British merchant vessels. In 1814 he was employed in the defence of Baltimore. After the war he was president of the board of navy commissioners until 1837, with the exception of the years 1824-27, when he commanded the Mediterranean squadron. He retired in 1837, and died at Philadelphia, Aug. 1, 1838.

His son, **JOHN RODGERS** (1812-82), rear-admiral, was born in Maryland, Aug. 8, 1812, and became a midshipman in 1828. In 1853-56 he commanded the steamer *John Hancock* in an exploring expedition in the North Pacific. At the outbreak of the civil war he had risen to the rank of commander, and early in 1862 he superintended the construction of the iron-clads for service on the Mississippi. In May he conducted an expedition of gun-boats on the James River, and attacked Fort Darling. In June, 1863, with the monitor *Weehawken*, he captured the Confederate iron-clad *Atlanta* near Savannah, Ga., after a very brief contest. For this exploit he was made commodore. In 1866 he made the perilous voyage around Cape Horn in the monitor *Monadnock*. In 1869 he was promoted rear-admiral and had command of the China fleet. In August, 1871, he captured the Korean forts, and put an end to the outrages which Koreans had committed on American commerce. He afterwards had charge of Mare Island navy-yard at San Francisco. He was made superintendent of the U. S. Naval Observatory at Washington, in 1877, and in the next year became also chairman of the Lighthouse Board. He was noted for his scientific attainments and did much to promote scientific work by the national government. He died May 5, 1882.

RODMAN, THOMAS JEFFERSON (1815-1871), inventor, was born at Salem, Ind., July 30, 1815. He graduated at West Point in 1841, and entered the ordnance department. His chief invention was a method of casting guns hollow and cooling them from the inside. For its results, and the comparative merits of his guns, see **ORDNANCE**. He also introduced the use of mammoth powder, and was constantly engaged in making and testing devices for the improvement of ordnance. During the civil war his guns were used by the navy as well as the army, and the method of cooling from the inside was applied to shells. Rodman had command of the Watertown arsenal during the war, and in June, 1863, was made major, and at the close of the war received the brevet of brigadier-general. In 1865 he was placed in command of Rock Island, where he constructed the arsenal. In 1867 he was promoted lieutenant-colonel. He died at Rock Island, June 7, 1871.

RODNEY, CÆSAR (1728–1784), a signer of the Declaration of Independence, was born at Dover, Delaware, Oct. 7, 1728. From his grandfather, William Rodney, an early settler of that State, he had inherited a large estate. In 1750 he was sheriff of Kent co.; for many years he was a member of the colonial assembly, and its speaker from 1769 to 1774. Here he zealously advocated a measure forbidding the importation of slaves, which was negatived by only two votes. In 1765 he was sent as a delegate to the Stamp-act congress at New York, and, on repeal of the obnoxious act, was one of three commissioners appointed to prepare an address of thanks to the king. When the tax on tea was proposed in the British Parliament of 1767, he was again one of three to frame an address to the king, in which resistance to oppression was foreshadowed. When the colonies entered into correspondence regarding common defence, Rodney became president of the Committee of Safety for Delaware. In 1774 popular meetings were held at Dover and Newcastle to demand the assembling of a convention, whereupon he, as speaker, summoned the representatives of the people to meet at Newcastle Aug. 1. Here he was made chairman, and he was further sent as a delegate to the Continental Congress of that year, where he was on the committee that drew up a statement of the colonies' grievances and rights. In 1775 he was re-elected to the Congress, and made at first colonel, and then brigadier-general, of the State militia. In 1776 he was constantly employed in patriotic activities. Being warned by friends, when the vote on the Declaration was imminent, he rode with all speed to Philadelphia, and was the means of casting Delaware's vote for independence. Failing in re-election to Congress, he went directly to Trenton, where Lord Stirling made him post-commander, but soon left to join Washington at Morristown. Returning home in 1777, he suppressed an insurrection in Sussex, and, when the British advanced into Delaware, he put himself at the head of some militia and annoyed the enemy's flank, with the view of cutting them off from their fleet. For his services here he was promoted major-general. In December he was re-elected to Congress, but did not take his seat, owing to his having been, in the meantime, chosen President of Delaware, a post he held for four years. In 1782 and in 1783 he was re-elected to Congress, but on both occasions declined, as he had done re-election to the presidency of Delaware in 1782. He had long suffered from cancer of the face, and died from it at Dover, June 20, 1784.

His nephew, **CÆSAR AUGUSTUS** (1772–1824), statesman, was born at Dover, Delaware, Jan. 4, 1772. He graduated at the University of Pennsylvania, studied law, was admitted to the bar in 1793, and practised in Wilmington. From 1803 to 1807 he was a prominent member of Congress, taking Jefferson's side, and from 1807 to 1811 he was U. S. attorney-general, under both Jefferson and Madison. During the war of 1812 with England he commanded an artillery corps which served on the Canadian frontier. In 1817 he went to South America as a member of the commission to report upon the propriety of recognizing the newly formed Spanish-American republics, which course he strenuously advocated. In 1821 he returned to Congress, and in 1822 was made U. S. senator. In 1823 Rodney was appointed minister to the Argentine provinces, and while discharging the duties of this position died at Buenos Ayres, June 10, 1824. With J. Graham he published *Reports on the United Provinces of South America* (London, 1819). His memory is still highly cherished in the Argentine Republic for the excellent counsel and other aid which he rendered at a critical time.

ROE, EDWARD PAYSON (1838–1888), author, was born at Windsor, N. Y., March 7, 1838. From his father he inherited a taste for horticulture which clung to him through life. He studied at Williams College with a view to the ministry, and after a year at Auburn

Theological Seminary became in 1862 chaplain of the Second New York Cavalry, whence he was transferred by Pres. Lincoln to the chaplaincy of Fortress Monroe hospitals. After the war he accepted a call from the Presbyterian church at Highland Falls, and here gathered materials for his *Nature's Serial Story*. In 1874 he removed to Cornwall-on-Hudson, and in this beautiful retreat, surrounded by fruits and flowers, most of his books were written. On the burning of Chicago, in 1871, he felt irresistibly drawn to visit the scene. Here, when sitting on the steps of Robert Collyer's church, his first story, *Barriers Burned Away*, began to take form in his mind. It had sale of 69,000 copies, and, encouraged by the unforeseen success, he now devoted himself to literature, and soon realized an income larger than any other American writer. His 16 works, mostly novels, have had a sale of 750,000 copies. Among his best-known works of fiction are: *Opening of a Chestnut Burr*; *Near to Nature's Heart*; *A Knight of the XIX Century*; *He Fell in Love with his Wife*. His horticultural productions are: *Culture of Small Fruits*; *Success with Small Fruits*; *Play and Profit of a Garden*. On July 19, 1888, he suddenly succumbed to neuralgia of the heart. Roe was pre-eminently a writer for the people, with whom he was in fullest sympathy, and whom it was his aim to elevate as well as to please. His style is simple, direct, and, though somewhat sensational, ever permeated by a strong feeling of morality. It has been said of him that he never wrote a line he could not preach.

ROEBLING, WASHINGTON AUGUSTUS, engineer, was born at Saxenburg, Pa., May 26, 1837. He is the son of the famous bridge-builder, John Augustus Roebling (1806–1869), for whom see *ENCYCLOPÆDIA BRITANNICA*. After graduating at Rensselaer Polytechnic Institute in 1857 he began work under his father at Pittsburg. In 1861 he enlisted in a New York artillery company and served in the Army of the Potomac. He was appointed on the staff of Gen. McDowell, and later on that of Gen. Pope, and engaged as military engineer, bridge-builder, and aeronaut. After rising to the rank of major in April, 1864, and winning higher brevets, he resigned in January, 1865, and resumed work with his father, who was then engaged on the railroad suspension bridge at Cincinnati. Of these Washington soon took nearly entire charge till its completion in 1867. In the next year he studied in Europe the system of pneumatic caissons for foundations, and on the death of his father, July 22, 1869, he was called to finish his plans for the construction of the famous Brooklyn bridge. After a severe attack of caisson fever in 1872, he endeavored, while still so weak as to be unable to leave his room, to continue his superintendence of the bridge, but was compelled in 1873 to recruit his health by a visit to Europe. On his return he resumed work and finally completed the bridge in 1883. He has since been engaged chiefly in conducting at Trenton, N. J., the wire manufactory established by his father.

ROGERS, CHARLES, Scotch author and antiquary, was born at Dunino, Fife, Scotland, April 18, 1825. He was educated at St. Andrews and was ordained in the established church in 1846. He was chaplain of Stirling Castle from 1855 until 1863, and succeeded in arousing such national interest in behalf of that early residence of Scotch kings that he was able to effect its complete restoration and to erect monuments to Wallace and the Bruce. He also induced Dean Ramsay to take the lead in the movement for the erection of a statue of Dr. Thomas Chalmers in Edinburgh. The organization of the Royal Historical Society in 1865 in London was due to his efforts, and he was its secretary until 1881. Much of his time has been devoted to genealogical investigations. His principal works are: *Scotland Social and Domestic*; *Monuments and Inscriptions in Scotland*; *A Century of Scottish Life*; *Traits and Stories of Scottish People*. He also com-

piled *Lyra Britannica*, a collection of hymns, and *The Modern Scottish Minstrel*, edited various fragments of early Scotch poetry, and wrote some popular religious books. He claims to have suggested to the British government, in 1868, the use of postal cards.

ROGERS, HENRY DARWIN (1808-1866), geologist, was born at Philadelphia Aug. 1, 1808, being the son of Dr. P. K. Rogers, who taught chemistry and physics successively in Philadelphia, Baltimore, and at William and Mary College. Henry was made professor of natural philosophy at Dickinson College, Carlisle, in 1831. He conducted a geological survey of New Jersey, and published a *Report and Map* (1835-40). Meantime he had been placed in charge of a similar survey of Pennsylvania, on which he was engaged from 1836 till 1855. Besides five annual *Reports* he prepared *The Geology of Pennsylvania* (3 vols., 1858, with 5 maps), which was published at the expense of the State. Having gone to Edinburgh to supervise the execution of the maps, he was called to the chair of natural science in the University of Glasgow, which position he held till his death, May 26, 1866. He edited the *Geological Atlas of the United States* (Edinburgh, 1861).

His brother, WILLIAM BARTON ROGERS (1805-1882), began to lecture on chemistry in 1827 and succeeded his father in his professorship in William and Mary College in 1829. He was made professor in the University of Virginia in 1835, and commenced a geological survey of that State which was discontinued in 1842. In 1853 he removed to Boston, where in 1864 he organized the Massachusetts Institute of Technology, and held the presidency of this institution ten years. He had in 1840 been active in forming the Association of American Geologists, from which eventually grew the American Association for the Advancement of Science. The latter body chose him to be its president in 1876, when distinguished scientists of Europe were expected to attend its sessions. He died at Boston, May 30, 1882. He contributed many important papers to the scientific bodies of which he was a member.

Two other brothers, JAMES BLYTHE ROGERS (1803-1852) and ROBERT EMPIE ROGERS (1814-1884), were eminent professors of chemistry, and were successively connected with the University of Pennsylvania.

ROGERS, JOHN (1505-1555), an English martyr, was born at Deritend, near Birmingham, in 1505. Having graduated at Pembroke Hall, Cambridge, in 1525, he became rector of a church in London. In 1534 he was made chaplain of the Merchant Adventurers at Antwerp. He had already embraced the doctrines of the Reformation and was intimate with Tyndale and Coverdale. He edited from Tyndale's manuscripts a revised English version of the Bible, which was issued in 1537 under the name of Thomas Matthew. Returning to England in 1545 he was again rector in London, and Bishop Ridley made him prebendary of St. Paul's in 1551. His sermon at St. Paul's Cross after the accession of Queen Mary caused him to be summoned before the Privy Council. He was then imprisoned in his own house and afterwards at Newgate. He was tried for heresy, condemned to death, and burnt at Smithfield, Feb. 4, 1555. The rude wood-cuts of Fox's *Book of Martyrs* and the *New England Primer* have perpetuated the scene. J. L. Chester (*q. v.*) prepared a careful biography of Rogers (1861), which disproves the claim of certain New England families to be descended from the martyr.

ROGERS, JOHN, statuary, was born at Salem, Mass., Oct. 30, 1829. After some youthful experience of mercantile life, he studied civil engineering and afterwards became a practical machinist, and had charge of a railroad repair shop at Hannibal, Mo. But his desire to study art led him to Paris in 1857, and afterwards at Chicago he modelled clay groups called *The Checker-Players* and *The Slave-Auction*, which attracted considerable attention. His famous series of war groups, beginning in 1861 with *The Picket-Guard*, made his name a household word. This series included

Taking the Oath, *The Home Guard*, *One More Shot*, *Union Refugees*, *The Camp Fire*, *The Returned Volunteer*. Before the close of the war he had greatly improved the mechanical execution of his works. Then other phases of American life began to furnish subjects. Among the most popular have been *Uncle Ned's School*, *The Country Post-Office*, *The Town Pump*, *The Visit to the Parson*, *The Doctor's Visit*, *School Examination*, *The Favorite Scholar*, and *Rip Van Winkle*. His groups are graceful and lifelike, sometimes pathetic and often humorous. They number altogether 64. Rogers has also executed statuary for lawns and gardens.

ROGERS, RANDOLPH, sculptor, born in Waterloo, near Auburn, N. Y., July 6, 1825, did not begin the study of art until twenty-three years of age. He studied under Lorenzo Bartolini, in Rome, from 1848 to 1850, then for five years he had a studio in New York, after which he returned to Italy in 1855. His works include the ideal busts, *Ruth* (1851) and *Isaac* (1865); *Nydia* (1856); *Boy Skating* (1857); *Angel of the Resurrection* (1861-2), which is on the monument to Col. Samuel Colt, in Hartford, Conn.; *Lost Pleiad* (1875); *Genius of Connecticut* (1877), on the State capitol at Hartford; memorial monuments for Cincinnati (1863-64), Providence (1871), Detroit (1872), and Worcester, Mass. (1874), an equestrian group of *Indians* (1881), and portrait statues of John Adams (1857), placed in Mt. Auburn cemetery, Abraham Lincoln (1871), in Fairmount Park, Philadelphia, and William H. Seward (1876), at Broadway and Fifth avenue, New York. The bas-reliefs on the bronze doors of the capitol at Washington, one of his best known works, representing scenes from the life of Columbus, were designed in 1858. He also completed the Washington Monument at Richmond, which Thomas Crawford had left unfinished. Crawford had made no designs for the statues of Mason, Marshall, and Nelson, and these, as well as some allegorical figures, were added by Rogers.

(F. L. W.)

ROHLFS, FRIEDRICH GERHARD, a German explorer, was born at Vegesack, April 14, 1831. After studying medicine he went to Algeria in 1855 as a surgeon in the French army. In 1860 he passed to Morocco, and in the disguise of a Mohammedan was the first European to enter the Oasis Tafilet. On his return journey he was severely wounded. In 1863 he crossed the Atlas Mountains, visited the Oasis Tuat, and returned by the way of Rhadames and Tripoli. In a third expedition in 1866 he reached Lake Tchad and crossed through Soudan to the Niger and the Guinea coast. In 1867 he joined the English expedition into Abyssinia, and in the following year sent Nachtigal (*q. v.*) with the king of Prussia's presents to the sultan of Borneo, while he himself explored Cyrenaica and went thence to Egypt. In 1873, under the patronage of the Khedive, he led an expedition through the Libyan desert. A visit to the United States in 1875 gave him an agreeable relief from these African journeys, but in 1878 he resumed his explorations of the Sahara and in 1880 delivered to King John of Abyssinia a letter from the German emperor. In 1884 he was made German consul-general at Zanzibar, but did not long retain the post. Since 1870 Rohlf's residence has been at Weimar, when he has not been engaged on foreign travel. His publications comprise narratives of his various expeditions and essays on the exploration of Africa and development of its resources. The most important are *Quer durch Afrika* (2 vols., 1875); *Entdeckung und Erforschung Afrikas* (1876-81); *Meine Mission nach Abessinien* (1883).

ROLLING-MILLS. For the general history of the manufacture of iron in the United States see IRON, of which the present article is a continuation.

The approved American practice in rolling iron is to use "three high" trains so that the hot iron passes through between the lower and the middle rolls in one

direction, and returns in an opposite direction between the middle and the top roll.

While a majority of existing rolling-mill trains are driven by steam-engines through gearing, new plants are generally directly connected; that is, the engine giving the motive-power has its shaft coupled to the driving-shaft of a roll train, which revolves at the same speed as the engine, and in some cases the engine drives a muck train direct, and is geared to run a merchant train at higher speed, or *vice versa*. In large plants a reversing engine is employed which changes its motion with each pass through the rolls. Some of the older rolling-mills receive all or a part of their power from water-wheels.

Prominent specialties of manufactured iron form the bulk of business at a number of rolling-mills. Among these are plate, sheet, skelp, bar, nail-plate, wire beams and angles, etc., and the practice of making one or two specialties is becoming more common continually. Smooth or grooved rolls of various design or sizes are required for each purpose, and many mills require a large stock of extra rolls to fill the orders of different sizes and shapes. For certain purposes chilled rolls (made of iron cast in chills so as to give a hard surface) are employed. These are principally used for cold rolling or finishing, and are often highly polished.

Nail-plate is rolled from 12 to 20 inches in width, and of thickness required for different sizes of nails, so that the plate can be sheared transversely into bars which are fed into machines which cut nails, preserving the grain of the iron.

Plate-iron for boilers or ships is made in smooth three-high trains of large diameter, and as the weight of some of the plates is great the pile is of corresponding size. The best brands of boiler plate-iron are known as "C. H. No. 1," and "flange" iron—C. H. being an abbreviation for charcoal hammered, and indicating that the iron was made with charcoal in sinking fires, hammered into blooms, and rolled out into bars which were piled for plate-iron. The U. S. secretary of the treasury publishes in the rules governing the construction of boilers for steam-vessels provisions that the tensile strength shall be stamped on plate, and that the ductility shall be as follows: "Iron of 45,000 pounds per square inch tensile strength shall show a reduction of area of 15 per cent., and each 1000 lbs. tensile strength shall show 1 per cent. additional contraction of area up to and including 55,000 lbs. tensile strength. Iron of 55,000 lbs. tensile strength and upwards showing 25 per cent. reduction of area shall be deemed to have the lawful ductility."

Sheet-iron has been rolled to such small gauge as to be thinner than paper; this was merely experimental and required a superior quality of iron. Most of the sheet-iron is made from metal above the ordinary character. There is no defining line between sheet and plate-iron, the terms being affected as much by the purpose for which the product is used as by its thickness; but iron under 3-16th inch is generally considered as sheet and above that thickness as plate-iron.

Skelp-iron is a term applied to long, narrow sheets of iron rolled for the purpose of making wrought-iron tubing or flues, of which large quantities are demanded for plumbing, gas-fitting, water or gas supply, oil or gas wells, etc.

The manufacture of beams, channels, angles, and special shapes is rapidly extending, and demands a plant of large proportions and powerful machinery. Fire-proof construction, bridge and roof-building, ship-building, and modern architecture constantly call for new shapes and sizes. Beams up to 20 inches in height have been rolled. The development of this specialty is the growth of but a few years, but it promises to continue to increase both in quantity and variety of product.

For the statistics of the production of Rolled Iron in the United States see the end of article IRON.

Wire Rods.—The general features of puddling, heating, and regenerative furnaces, squeezers, hammers, roll-trains, etc., are given in the *ENCYCLOPEDIA BRITANNICA*. There are numerous improvements peculiar to American practice which apply to various specialties, but the advance has been more marked in the rolling of rails, particularly in connection with the Bessemer steel-works. In another specialty American practice has been remarkably progressive, viz., the rolling of wire. The requirements of this country are not less than 350,000 tons of wire rods per annum. Since on an average 125,000 to 150,000 tons are imported, there is a balance of at least 200,000 to 225,000 tons to be provided for by American works. These possess about 30 trains of roll, some of which roll small iron and merchant shapes during a part of the time. Steel wire rods are made a specialty by about a dozen firms.

The iron wire rod trains and modern steel rod mills do not work under the same conditions. For both rapid rolling is desirable, but for different reasons. With the first it is aimed at on account of its influence upon the character of the product; with the second, for the effect it has upon the cost. In order to reduce the number of passages through the wire draw-plate, rods for wire-drawing must be rolled to small dimensions, while avoiding anything that injures the quality of the iron. Speed in rolling tends to completely utilize the welding and to allow of making the small sizes aimed at before the wire grows too cool. If this temperature should be reached before the last pass, the transformation of the previous oval into round cannot be effected without affecting the molecular structure of the metal and robbing it of certain properties. The iron will be hardened, and in cooling will not be covered by the blue oxide but by reddish oxides. In order to manufacture No. 7 and No. 8 B. W. gauge, it is therefore necessary to increase the speed of rolling and to be content to roll pieces of moderate length, according to the softness of the metal treated.

It is a different matter with steel wire rods, which are rarely smaller than No. 5 B. W. gauge. With them the question of maintaining quality is not the ruling one. Steel is more easily rolled than iron, and in this case high speed is aimed at chiefly to reduce cost of labor and general expenses.

The oldest wire rod mill, the English train, consists of five stands of rolls in a line, viz., an 8½- to 10-inch three-high roughing set and four sets of 7- to 8-inch continuous rolls. In this system the speed of the rolls is limited by the skill of the workman. Its defects have led to its being generally replaced by what the Americans call the "Belgian" system. In it the roughing train is separate, having a speed below 200 revolutions, being a set of three 12- or 13-inch rolls, with the pinions placed at the outer end, in order to interfere less with the finishing train. The latter, placed parallel to it and 40 to 50 feet from it, consists of a stand of pinions and five to seven two-high sets, which may be driven at greater speed.

In some mills a further step has been taken. Instead of increasing regularly the size of all the finishing rolls, those or the two last sets have been increased half an inch, by which the corresponding passes, leaving injurious loops of wire between the last two, have been diminished.

An essentially American train is arranged to roll 4-inch blooms about 4 feet long, which are directly converted into rolls of wire several hundred feet in length. It suppresses one reheating, the loss, the cost and the waste of oxidation which that implies. This idea necessitates certain special arrangements. The passage from one set of rolls to the next must be prompt. Two to three blooms pass per minute, and 90 to 100 seconds suffice for the complete reduction of each one of them.

A train resembling the above, running since 1884, used 4-inch steel blooms weighing from 125 to 130 lbs. In one week, making 11 single turns, the mill rolled

420 gross tons of No. 6 rods direct from a 4-inch bloom. In one day of 10½ hours a record of 111,220 lbs. of No 6. has been made. A special feature is the use of natural gas at the boilers and two bloom reheating furnaces. The entire force for the operation of the mill was 40 men and boys.

The general arrangement and working of the last-mentioned plant are as follows: The boilers occupy one corner of the building, the heating furnaces and shears the front, the ingot-reheating furnaces one side, and the reels the other side. The blooming, billet, intermediate and continuous trains are located centrally, the axes of the three trains being parallel. After the bloom is reduced to the section and length desired it is heated in the furnaces before undergoing further work. It first goes through the billet train. When rolling steel the last set of this train, in which the billet is generally given only one pass, the rolls may be flat; when rolling iron, however, they must be grooved. The bloom is thus reduced to a 1 by ½-inch rectangular or oval section. It then goes through the intermediate train, where it is given a round, oval, or square section equivalent to a section of ½ by ¾-inch. It is then finished in the continuous train. The single set of rolls which constitutes the intermediary is placed behind the delivery pair of the billet train and in front of the first set of the continuous train, and in the same line of feed. The billet is carried from the billet train and fed to the intermediate train by a guide, and from this train to the continuous train by another guide tube. This last train consists of two parts and is composed of eight sets of rolls through which the billet passes in succession, conducted from one pair to the other by guides. In leaving the last pair of rolls the rod goes through a guide which conducts it towards the reels on which it is wound. One man handles the reels. He seizes the end of the rod, attaches it to one of the two reels, and while one is winding the other is emptied and got ready to receive the following rod. In this continuous rod-mill the wire is passing in opposite directions through different rolls simultaneously, and while the finished end is being wound on a reel the balance of the now reduced billet is still passing through several pairs of rolls.

The following represents the geographical distribution and general equipment of the rolling-mills of the United States not connected with steel works:

ROMAN CATHOLIC CHURCH. This article treats only of the history of this church in the United States. This church is coeval with the earliest attempted settlements by the Spaniards at the South, by the French in Maine, along the Lakes, and down the Mississippi Valley, and by English Catholics in Maryland after ineffectual projects in Maine. Ponce de Leon, after discovering Florida in 1513, attempted a settlement in 1521, accompanied by priests; and in 1526 Ayllon began a settlement on James River, Va., two Dominican priests, Fathers Anthony de Montesinos and Anthony de Cervantes, beginning the regular ministrations of religion. The expeditions of Narvaez and Soto were attended by priests, but no settlement was made. A Franciscan Father, Mark of Nice, on information given by survivors of Narvaez's force, penetrated to the Zuñis, of New Mexico, and missionaries with Coronado's expedition, 1540-42, penetrated to the country near the Missouri and Mississippi, where Father Padilla and a companion were killed by the natives. Father Luis Carcer met the same fate in Florida in 1549, while attempting to found a mission, unprotected by soldiery or colonists. An expedition under Luna near Pensacola, 1558-61, failed, the Catholic service being regularly offered there by priests who accompanied them. The first permanent settlement at St. Augustine, Sept. 8, 1565, was begun with the celebration of mass by Rev. Martin Francisco de Mendoza Grajales, the first parish priest, and the service of the church has been continued in Florida with brief interruption (1763) to the present time. The parish registers of St. Augustine are extant from Jan. 1, 1594. From St. Augustine Indian missions were extended north and south, and an attempt was made even on the Rappahannock, where several Jesuit missionaries were put to death (1571), as Franciscans were on the Georgia coast (1597). The Catholic clergy in Florida were subject to the Bishop of Santiago de Cuba. In the West the Franciscan Rodriguez and his companions penetrated to New Mexico to found a mission, but perished (1581). This led to the occupation of the country by Don Juan de Oñate in 1595. He began a settlement at San Juan de los Caballeros, where a church was erected (August-September) and the regular services of the Catholic worship begun; missions were established among the Pueblo Indians, and as converts were made churches were established in most of their towns. These continued till 1680, when the Indians rose against the Spaniards, massacred most of the missionaries, and drove all whites from New Mexico. When the territory was reoccupied by Vargas in 1692 the clergy of the Catholic Church resumed their labors among whites and Indians, and continue them to this day. The churches were under the charge of the Bishop of Guadalajara, and subsequently under the Bishop of Durango. In 1696 the Jesuit Father Kühn founded the mission of San Xavier del Bac and others in the present Arizona, and during the eighteenth century priests of that order pushed their California missions northward.

At the North, after laboring in Nova Scotia, the Jesuit Father Biard attempted to found a mission settlement on Mount Desert Island, which was broken up by Argall (1613). As the Jesuit missions in Canada extended, Dreuillette founded a mission among the Abnakis on the Kennebec (1646); Jogues (*q. v.*) among the Mohawks (1646); Le Moyne among the Onondagas (1654); Menard among the Chippewas (1660). The missions thus founded were followed up with wonderful zeal and courage. The Indians from the Passamaquoddy and Penobscot to the Kennebec became and remain Catholic; numbers of converts were made among the Five Iroquois nations, whose descendants are found now at Caughnawaga, the Lake of the Two Mountains, and St. Regis. The remnant of the Tionontate Hurons were gathered on Lake Superior, and finally at Sandusky, and missions were established among the Ot-

tawas, Chippewas, Sacs, Foxes, Menominees, Winnebagoes. Father Marquette sought to extend Christianity to the Illinois, Miami, and other tribes in the valley of the Mississippi, and accompanied Joliet on his exploration of the Mississippi to the Arkansas. He died after founding a mission in Illinois. These Jesuit missions under Dreuillettes, Jogues, Lamberville, Menard, Allouez, Gravier form a remarkable chapter in American history. The Franciscan Recollects followed with missions in Illinois, and churches at Niagara and Detroit, Father Hennepin reaching the country of the Sioux and naming St. Anthony's Falls. Priests of the Foreign Missions from Quebec then established parishes among the colonists at Cahokia and Mobile, and attempted Indian missions among the Natchez and other tribes. When Louisiana was settled, the care of the settlements was confided to the Capuchin Fathers and the Indian missions to the Jesuits, several of whom perished at the hands of the Natchez and their allies. All these parishes and missions were subject to the Vicar Apostolic of Canada (1658), who became Bishop of Quebec in 1674. The Indian missions were annihilated by the hostility of the French government to the Society of Jesus and the loss of the country in 1763.

The colonies of Virginia, Plymouth, and Massachusetts Bay excluded Catholics, and they were not tolerated by the Dutch in New Netherland. Projects of Catholic settlement were attempted by Sir Thomas Gerard under Sir Humphrey Gilbert and by Lord Arundell of Wardour under Capt. Weymouth, but failed. Sir George Calvert, Lord Baltimore, after being repulsed from Virginia as a Catholic, obtained a patent for lands lying south of that colony in his own name and that of Sir Thomas Arundell, and when that patent was revoked obtained another for Maryland, lying north. Here his son Cecil founded the colony of Maryland, most of the landed gentry and many of the settlers being Catholic, and ministers of no other religion appearing for years. The services of the Catholic Church began on St. Clement's Island, on the Potomac, March 25, 1633, under Revs. Andrew White and John Altham. This was the nucleus from which the organization of the church in the British provinces in colonial days grew. The Catholic Church in Maryland enjoyed a period of comparative freedom till 1645, when Clayborne overthrew the power of Lord Baltimore, carried off Father White and others to England, and compelled the rest of the Catholic priests to seek refuge in Virginia, where they lay concealed, suffering greatly, two dying soon after. When Lord Baltimore's authority was restored, other priests came over, and in 1649, under the impulse of the lord proprietor, a general act of religious toleration was passed. But in 1652 Clayborne and Bennett in the name of the Commonwealth overthrew the proprietary government, excluded Catholics from the Assembly, which then passed an act disfranchising them completely. The priests again took refuge in Virginia, from which they visited their flocks by stealth. On the Restoration the Jesuit Fathers resumed their work in Maryland, and in 1672 the English Franciscans founded a mission in that province which lasted about half a century. When James, Duke of York, took possession of New Netherland and made it the English colony of New York, religious liberty was granted and Catholic officers and settlers arrived. Jesuit Fathers came over in 1683, and the services of the Catholic Church commenced. A Latin school was established here as one had been in Maryland, the New York Assembly in its Bill of Rights establishing religious freedom. Penn. in settling Pennsylvania, adopted the same liberal policy, and Catholics began to settle in that province. The Revolution of 1688 was followed by a reaction. Lord Baltimore was deprived of the administration of Maryland; Catholics were again disfranchised there and in most of the colonies; in Maryland they were compelled to support Protestant clergy and

contribute to the erection of Protestant churches, subjected to double taxes; and in Virginia their testimony could not be received in any case, civil or criminal. This state of things continued to the American Revolution. No churches could be erected, and Catholics had only private chapels connected with houses and under the same roof. In Pennsylvania alone were there Catholic churches, at Philadelphia, Lancaster, Conewago, Goshenhoppen.

The conquest of Canada by England in 1763 crippled the church in that province, and the churches at Detroit, Vincennes, and other points in the West suffered; the action of the French government against the Society of Jesus cut off the supply of priests for the Jesuit missions among the Indians; and the complete suppression of the order by Pope Clement XIV. in 1773 left the Catholics in Maryland with no source for a supply of priests. They had been subject to the Vicar Apostolic of the London District in England, who had no means of sending clergymen. Bishop Challoner endeavored to have a bishop appointed as Vicar Apostolic for Maryland and Pennsylvania, but failing in this, sought to have the Catholics there after 1763 placed under the control of the Bishop of Quebec. England obtained Florida also by cession from Spain, but the old population withdrew. Minorcans were introduced at New Smyrna by Dr. Turnbull and they were accompanied by priests. This colony finally rebelled against their cruel treatment and removed to Saint Augustine, accompanied by the priests, and their descendants at this day form part of the population. Mobile also passed into the hands of England, but the French settlers and their priest remained. This was the position of the Catholic body in British territory when, in 1774, the Quebec Act recognized the Catholic Church in the country north-west of the Ohio and reannexed that district to Canada, a step which precipitated the American Revolution and gave that movement in its early stages a strong anti-Catholic character.

When the struggle between the Thirteen Colonies and Great Britain actually began, the desire of conciliating and winning the Canadians, who actually raised two regiments, as well as the hope of gaining sympathy, if not direct aid from France and Spain, dictated a more kindly policy. Washington checked in his camp the celebration of Pope-Day on Nov. 5, and Congress appointed a Catholic chaplain in the army. Envoys from France and Spain, the service of the Catholic Church by French army and navy chaplains, attended by State and Federal officials, soon made the once hated church less odious, while the adherence of Catholics to the national cause secured a degree of favor. At the close of the Revolutionary war there were bodies of Catholics scattered through the country, chiefly in the large ports. The number in all probability exceeded 50,000: the clergy in Maryland, who during the war had been disowned by the Vicar Apostolic of the London District, applied to the Pope for a national organization and a local superior. A French intrigue sought to subject American Catholics to a bishop nominated by the French king, but Pius VI. in 1784 appointed the patriotic Rev. John Carroll Prefect Apostolic in the United States, and in 1789 erected the see of Baltimore, creating as first bishop the Rev. Mr. Carroll, who had been nominated by the almost unanimous voice of the clergy. At this time there were Catholics not only in Maryland, Pennsylvania, and New Jersey, with a few in Virginia, but also in Boston, New York, Charleston, and Savannah, Catholic Indians in Maine and New York, and a considerable body of French origin north-west of the Ohio and on the banks of the Mississippi. Bishop Carroll, whose diocese was coterminous with the limits of the republic, soon asked to have it divided, as the number of Catholics was gradually increasing by emigration from Europe. A coadjutor was at first assigned to him, but in 1808 new sees were erected at New York,

Boston, Philadelphia, and Bardstown, Ky., and Dr. Carroll was made Archbishop of Baltimore, retaining jurisdiction over the Catholics in Maryland and the States to the southward on the Atlantic and westward to the Mississippi. Some parts held for a time by England and Spain had eventually come under national control. The French Revolution sent to the United States many priests of great learning, zeal, and piety. The Sulpitians founded a theological seminary at Baltimore, the members of the old Society of Jesus founded Georgetown College, and established a high-school at New York, reorganized in connection with the body in Russia, and were finally fully restored by the Pope in 1815. English Dominicans driven from Belgium founded a province of the order in Kentucky; a community of Carmelite nuns from Europe was established at Port Tobacco, Md.; one of the Visitation order was organized by Bishop Leonard Neale, the coadjutor and successor of Carroll; the Sisters of Charity were founded by Mrs. Eliza A. Seton, a New York lady who entered the Catholic Church, and similar bodies were founded in Kentucky by Bishop David and Rev. Charles Nerinckx. A combined seminary and college was established at Emmitsburg, Md., and schools in various parts. The printing of Catholic books almost impossible in colonial days began: the Bible was printed in 1790 and 1805, as well as devotional, instructive, controversial, and apologetic works.

The cession of the vast province of Louisiana to the United States in 1803 and of Florida in 1820 added a considerable Catholic element to the population. These provinces after being made subject ecclesiastically to the Bishop of St. Christopher of Havana in 1787 had been erected into a diocese in 1793, but at the time of the cession were without a bishop, and in a state of disorder, with few clergymen and neglected parishes. Bishop Carroll was appointed Administrator, but could do little to restore discipline or revive religion. He finally under authority from the Pope appointed Rev. William Du Bourg Administrator, who, in 1815, was consecrated Bishop of Louisiana and the Floridas.

The Catholic population in the United States up to this time was mainly of native birth, with some accessions by immigration and the children of those who reached the country after 1783, but the close of the wars of the French Revolution was followed by a great tide of emigrants from Great Britain and in time from other parts of Europe, a large proportion of which was Catholic. These new-comers followed the lines of the great public works, and improved means of communication and helped to build up the North and West, where the Catholic body rapidly increased in numbers and influence, the slave labor at the South generally excluding them from that section. In the movement of the older population westward Catholics were also largely represented. Sees were established at Richmond and Charleston in 1820; at Cincinnati in 1821. A few years afterwards the great diocese of Louisiana was divided and sees erected at New Orleans and St. Louis, while Alabama and Florida were assigned to a Vicar Apostolic, who soon became Bishop of Mobile.

The necessity of concerted action as to discipline had been felt, and in 1829 the first Provincial Council of Baltimore was held, Archbishop Whitfield presiding, nearly all his suffragans, and Bishop Rosati of St. Louis, though not of the province, attending. Great difficulties had arisen in Charleston, Norfolk, and Philadelphia, from the action of trustees of churches, who claimed the right of nominating and instituting priests, and refused to admit or recognize priests appointed by the bishop of the diocese. The trouble in Philadelphia lasted for years and the diocese was at this time actually managed by an administrator. The council declared expressly that no right of patronage vested in the trustees and maintained the right of each bishop to appoint and remove priests in

his diocese, and directed the interdiction of any church where the trustees refused to receive the priest appointed or refused him the usual salary. By this time the Catholic body numbered about 500,000, under an archbishop, 9 bishops, about 200 priests, and with as many churches, several theological seminaries, 8 colleges, and 20 academies for young ladies. The strong prejudice against the Catholic Church about this time was increased by publications issued in England in opposition to the emancipation of the body in the British isles. Similar publications appeared here, like that fiction ascribed to Maria Monk, and one of the results was the destruction by a mob of the Ursuline Convent at Charlestown, Mass., in 1834, resulting in the death of one of the nuns. (See Riots.)

In spite of this movement the growth of the Catholic Church increased. Bishops were established at Detroit in 1832, Vincennes, Ind., in 1834, Dubuque, Iowa, Nashville, Tenn., and Natchez, Miss., in 1837. Each new see became a centre where a bishop labored to build up churches and institutions. Aid was afforded to these struggling churches by the Association for the Propagation of the Faith, a society established in France to aid foreign missions, mainly through the influence of Bishop Du Bourg of Louisiana, and by the Leopold Verein, a similar organization at Vienna, emanating from the appeals of Bishop Rézé, first Bishop of Detroit. Catholic papers, magazines, and books increased in number and circulation, and attempts were made to revive and extend the old Catholic missions among the Indians. Those in Maine had always been maintained; that in Northern New York was attended from Canada; work was renewed among the Ottawas, Chippewas, Pottawatamies, Kickapoos, and Kansas, by the Redemptorists, Jesuits, and secular priests like Baraga and De Seilles. Tribes on the Rocky Mountains hearing of the Catholic faith sent to St. Louis for priests, and Father Peter J. De Smet became the apostle of the Flatheads and other mountain tribes. In 1843 bishops were established at Little Rock, Ark., and Pittsburg, Pa., and the next year at Hartford, Chicago, and Milwaukee, and Oregon Territory was formed into a Vicariate Apostolic in 1843.

About this time a question arose which has often inflamed the public mind. The early schools of the country were all under church control, but others grew up, all aided by the State. In New York frauds brought church schools into disrepute, and the schools of the Public School Society at New York alone received aid. These were distinctly Protestant in management, teachers, books, and tone, and Catholic children were subjected to constant annoyance. The petition of the Catholics for the revival of the former aid to their schools raised the famous school question, never yet satisfactorily adjusted. Bishop Hughes, of New York, distinguished himself in a debate before the New York Common Council, and a system of State schools grew up and spread to many States, but the original difficulty remains. The discussion in 1842 roused great opposition, and a political party, "Native Americans," opposed to Roman Catholics, and to the influx of foreign mechanics, was formed. The attempt of the party to hold meetings in a part of Philadelphia largely populated by Irish Catholics led to furious riots in 1844, in which two Catholic churches, a convent, and many houses of Catholics were destroyed before the authorities could restore order. At this time (1844) the Catholic churches in the United States numbered 21 dioceses, 1 vicariate, 634 priests, 611 churches, with a population of 1,300,000.

The annexation of Texas in 1845 added an old Catholic district, and the subsequent war with Mexico added to the national domain New Mexico, California, and Arizona, with white and Indian Catholics. Texas had been from 1689 the scene of missions founded by a remarkable man, the Ven. Anthony Margil; New Mexico had been directed for two cen-

turles by Franciscan and other priests, and in California was a series of missions founded by Father Juniper Serra and other Franciscans; while Arizona had missions founded by F. Eusebius Kühn, S. J. Texas was made a prefecture apostolic in 1840, and a see erected at Galveston in 1847; a bishop had been appointed for California in 1840, and one was established at Monterey in 1850, and a vicar apostolic at Santa Fé, New Mexico, in the same year. In these parts the church had labored to revive religion in the Spanish and Indian elements, and to meet the wants of the new body of Catholics from the older States and Europe. In the older parts the growth of the Catholic Church continued, and to meet it Oregon City was made an archbishop's see in 1846, St. Louis in 1847, New Orleans in 1850, and San Francisco in 1853; and bishops' sees were erected in 1847 at Albany, Buffalo, Cleveland, and in 1850 at Nesquehly, St. Paul, Savannah, and Wheeling. The great province of Baltimore, which from 1808 included all east of the Mississippi, was divided in 1850 by the erection of archbishoprics at New York and Cincinnati; New York, Cincinnati, St. Louis, Oregon City, and San Francisco thus became centres, and each archbishop with his suffragan held provincial councils, and stimulated the erection of churches and institutions, the establishment of discipline, the care of the religious education of the young.

To secure uniformity on several points of ecclesiastical discipline a plenary council of all the archbishops and bishops of the United States was held at Baltimore in May, 1852, and has been followed by two others in 1866 and 1884. Sees were erected at Brooklyn, Burlington, Covington, Erie, Natchitoches, Newark in 1853; Portland in 1855; Fort Wayne and Sault Ste. Marie in 1857. Progress had been steady although a political party was formed about 1853, a priest tarred and feathered in Maine, and churches destroyed in some parts of the country. In 1861 when the civil war broke out the Catholic Church in the United States comprised 7 provinces, 45 bishops, 2317 priests, 2517 churches, 49 theological seminaries, 300 colleges and female academies, 660 parochial schools, 230 charitable institutions. The war checked immigration and crippled greatly the feeble churches and institutions in the Southern States. In 1888 the Catholic Church in the United States numbered 11 archbishops, one of them a cardinal, 68 bishops, 7596 priests, 6829 churches, 91 colleges, 588 academies, 2606 parochial schools, with 511,063 pupils, 472 charitable institutions, and with a population of nearly 10,000,000.

In promoting and conducting this remarkable progress of the church the eminent men have been Archbishops Carroll, Kenrick, and Spalding, of Baltimore, Cardinals McCloskey and Gibbons, Bishops England and Lynch, of Charleston; Hughes, of New York; Henni, of Milwaukee; Cheverus and Fenwick, of Boston; Flagnet, of Louisville; Du Bourg, of New Orleans; Neumann, the holy bishop of Philadelphia; O'Connor, of Pittsburgh; Ireland, of St. Paul; Archabbot Wimmer, who introduced the Benedictines into the country; Very Rev. Edward Sorin, founder of Notre Dame, Ind.; Prince Demetrius Galitzin, Rev. Charles Nerinckx, Kentucky; Rev. Peter J. De Smet, S. J., and Bishop Baraga, in Indian Missions; Mgr. Corcoran and Rev. I. T. Hecker, Father Müller, C. SS. R.; Rev. Charles I. White, Rev. F. X. Weninger, Rev. C. C. Pise; Dr. O. A. Brownson, eminent in philosophy; J. A. McMaster, editor. Among women Mrs. Seton, foundress of the Sisters of Charity; Teresa Lalor, of the Visitation Nuns; Mme. Galitzin, of the Ladies of the Sacred Heart.

At the present time few countries have so many religious orders as the United States, where there are Benedictines, Cistercians of La Trappe, Franciscans, Dominicans, Augustinians, Carmelites, Jesuits, Redemptorists, Passionists, Sulpitians, Sanguinarians, Oblates, Priests of the Holy Cross, of the Resurrec-

tion, of Mercy, Capuchins, Lazarists, Fathers of the Holy Ghost and of St. Viator, Paulists, Servites; Nuns of the Benedictine, Carmelite, Franciscan, Dominican, Ursuline Orders, Sisters of Charity, Mercy, the Good Shepherd, the Holy Cross, St. Joseph, Christian Charity, Felician Sisters, Sisters of Providence and of Loretto, School Sisters of Notre Dame, Bon Secours Sisters, Sisters of St. Agnes, St. Anne, St. Clare, of the Holy Child, of the Holy Name of Jesus and Mary, of the Immaculate Heart, Incarnate Word, Presentation, Alexian Brothers, Brothers of the Christian Schools, Brothers of Mary, Franciscan Brothers, Brothers of the Holy Cross, Xaverian Brothers, Brothers of Charity, Brothers of Good Works. The communities of Sisters and Brothers are engaged in teaching, or the direction of hospitals, asylums, and other charities.

The latest step has been the foundation at Washington, D. C., of a great Catholic University, of which Rt. Rev. John J. Keane, D. D., Bishop of Richmond, has been appointed rector. The leading periodicals of the church are the *American Catholic Quarterly*, the *Catholic World* (monthly), *Ave Maria*, *Messenger of the Sacred Heart*, the *Freeman's Journal*, *Catholic Universe*, *Workeits Freund*, *Propagateur Catholique*, *Revista Catolica*, *Catholic Standard*, *Catholic Review*. (J. G. S.)

ROMANS, EPISTLE TO THE. The article in the *ENCYCLOPÆDIA BRITANNICA* on the See Vol. XX. Epistle to the Romans presents few p. 727 (p. 746 points open to censure, though opinions Am. Rep.). necessarily differ in regard to some of the positions taken. The present article proposes to treat of the two earlier groups of Pauline epistles, indicating some of the questions which arise in discussing them, whether from the historical or exegetical point of view.

The general view taken of the epistles, the order of writing, purpose, etc., may be found in the article **PAUL**.

I. The earlier group of Epistles.—The first written were 1 and 2 Thessalonians. These stand by themselves in some respects, while the four other epistles, written during the third missionary journey, are closely related to each other. The genuineness of 1 Thessalonians is accepted in the *BRITANNICA*, but doubts are cast upon 2 Thessalonians. These doubts arise entirely from exceptions taken to the contents of the epistles, especially the admonition against the expectation of the speedy coming of the day of our Lord (2 Thess. ii. 1-3, etc.). But the second epistle seems a very natural sequel to the first, and the external testimony supporting its genuineness is conclusive to those who duly weigh such evidence.

The four other epistles, written within one year (A. D. 57-58), are Galatians, 1 and 2 Corinthians, Romans. They are frequently spoken of as the "undoubted" Pauline epistles, since the genuineness of all is undisputed.

The Epistle to the Galatians.—There is a difference of opinion as to the chronological position of Galatians; some place it before 1 Corinthians, regarding Ephesus as the place of writing; others think it was written at Corinth, shortly before Romans (Conybeare, Lightfoot, and others). In favor of Ephesus we may urge the nearness to Galatia, the strong emotion showing that the news of the defection had come to the apostle quite recently. In favor of Corinth it is urged that the epistle resembles 2 Corinthians in tone and Romans in thought, and that the later date accords better with the history of Paul's conflicts. But the difference between the *tone* of Galatians and that of Romans, in spite of the similarity of thought, seems to indicate a longer interval between the two. We therefore prefer the earlier date, at Ephesus, which is usually accepted by German and American scholars.

The contents of the Epistle to the Galatians are readily analysed. Chaps. i., ii., the apostle's defence

of his apostleship; chaps. iii., iv., a defence of his preaching (justification by faith, life by the Spirit, not according to the flesh); chaps. v., vi., practical exhortation, to stand fast in the freedom for which Christ freed us.

The Epistles to the Corinthians.—In these we also discover the apostle attacking error and defending himself. But the error is by no means so fundamental. There is no evidence of Judaizing opposition. The evils in the Corinthian Church were mostly practical; party spirit prevailed, some sexual sins were tolerated, disorders were allowed in the public assemblies, and among the believers there were erroneous views respecting the resurrection. News of all this having come to Ephesus, the apostle writes thence his first letter, probably just before the riot spoken of in Acts xix. This letter deals first with the party divisions and Paul's mode of teaching; chaps. i.-iv. (It is not at all certain that these parties were fully developed divisions in the church, though some attempt to prove this.) In chaps. v.-vi. he alludes to the sin of unchastity, and to the habit of going before heathen magistrates. Then follow replies to questions that had been submitted to him about marriage, and meat that had been offered to idols; chaps. vii.-viii. A digression of a personal character then occurs; chaps. ix.-xi. A direct censure of the disorders in church assemblies (chap. xi.) prepares the way for a discourse about spiritual gifts (chaps. xii.-xiv.), in the midst of which (chap. xiii.) is placed that remarkable eulogy on "love" as "a still more excellent way." The discussion about the resurrection (chap. xv.) is the only portion of the epistle that is distinctly doctrinal, and the latter part of it assumes a prophetic character. Injunctions respecting the collection for the saints at Jerusalem, a matter which the apostle was now pressing upon many of the churches, and personal notions and greetings make up the conclusion in chap. xvi.

After writing this epistle Paul left Ephesus, and passing through Troas (2 Cor. ii. 12) sailed to Macedonia (Acts xx. 1, 2). From some point in this province he wrote 2 Corinthians (2 Cor. viii. 1, ix. 2-4). It is possible that he wrote a brief letter previous to this, but nothing can be proven on this point. Some have thought that he made a brief visit to Corinth before writing 2 Corinthians, but this also lacks sufficient proof. Yet the occasion of the second letter preserved for us was evidently intelligence received from that city (chap. vii. 7-16), and this, too, not altogether reassuring. The larger part of the Corinthian Church seems to have accepted the admonitions given in the first letter, but Paul's opponents were embittered. The second epistle, in its abrupt changes of style, tone, and topic, shows the conflicting feelings of the apostle. He strives to win the malecontents, but evidently intends to exercise severe discipline upon them, should they remain refractory. Hence no one letter of Paul's reveals the man more fully; none of his writings show greater tact, power, and eloquence. The epistle is usually divided into three parts: chaps. i.-vii., a representative of the apostle's character and labors, but with constant appeals to the Corinthians themselves; chaps. viii., ix., further directions about the collection for the poor saints at Jerusalem; chaps. x.-xiii., a defence of his apostolic dignity, varied in tone and method, full of tenderness, yet very forcible in its appeals. This defence differs greatly from that in Galatians; the defection at Corinth was not doctrinal, but practical and personal. Hence he seeks far more to win by personal appeals. To the Galatians he speaks as by direct authority, making known the one revealed gospel; to the Corinthians he speaks as the pastor, clothed with authority, but desirous to win back those who have erred. It is, therefore, difficult to analyze this epistle, which for this very reason remains the most interesting picture at once of the apostle and of the early Gentile Christian Church.

The Epistle to the Romans.—1. The purpose. Com-

ing to Corinth the apostle remained there three months (Acts xx. 3), and during this time wrote the Epistle to the Romans; a fuller, more didactic setting forth of the same great truths of salvation which formed the theme of Galatians. But the polemic tone has largely disappeared. This would indicate that the state of things in Corinth was more satisfactory. At all events it enables us to determine more certainly the purpose of the epistle.

The article in the *BRITANNICA*, while clearly right in maintaining that the church at Rome was made up mainly of Gentile Christians, attempts to show that the purpose of the epistle was largely polemic, that is, directly in opposition to the false views of Jewish believers, if not of Judaizing teachers. No doubt there are abundant indications of such opposition. The conflict in Galatia was quite recent, and indeed there was a permanent antagonism between the universal scope of the gospel as maintained by Paul and the narrower view. But in this epistle the positive statement of the universal aim of the gospel is dominant; the polemical purpose is incidental. The apostle sets forth his own views, knowing that most of the Roman Christians are in sympathy with him. Being unable to visit them on account of the collection he is to carry to Jerusalem, he writes to them by Phœbe, xvi. 1, in order to strengthen and instruct them. It is the comparative freedom from a polemic purpose that makes the epistle what it is, the fullest statement of Paul's soteriological views. On the other hand it is a letter, not a theological treatise, and as a letter adapted to the needs of the church it includes references to the tendencies that were likely to penetrate wherever Jewish influence was felt. Moreover, as a letter it deals with the great matter of salvation by faith, not abstractly, but in vital and personal fashion.

2. The theme of the epistle, so far as its doctrinal contents (chaps. i.-xi.) are concerned, is given in chap. i. 16: The gospel "is the power of God unto salvation to every one that believeth; to the Jew first, and also to the Greek." The next verse shows that justification by faith is an essential part of this statement; but the theme is a wider one; salvation by faith to all classes. The three leading ideas, presented in varied order and relations, are these: universality, grace, and faith. Salvation is for all classes, therefore, it must be of grace, and hence is accepted by faith; or being of faith, it is of grace, and hence universal. The three ideas enter everywhere, and always in vital relation, distinguishable, but not divisible from each other.

3. The contents of the epistle. Accepting the usual division into didactic (i.-xi.) and hortatory (xii.-xvi.) portions, it is only necessary to indicate the leading parts of the former. After the address, introduction, and theme (i. 1-17), we find four main divisions: (1) All men, Gentile and Jew, need salvation, for all are sinners; i. 18-iii. 20. Hence (2) righteousness from God (justification) is by faith, as the Old Testament indicates; iii. 21-iv. 25. (3) Thus men are saved; this is the power of God unto salvation; v.-viii. (4) Historically, it was for the Jew first, but also for the Greek, and despite the unbelief of the former, God's promise stands; ix.-xi. (It is to be noted that according to another analysis, chaps. iii. 21-v. may be regarded as treating of justification by faith, and chaps. vi.-viii. of sanctification by faith.)

It is clear to every one who accepts the exegetical method that Paul in the earlier part of his letter lays stress upon the way God accounts men righteous, and that he afterwards meets the objections arising from the ever recurring notion that such justification fails of resulting in actual righteousness. Midway between these two points the apostle inserts the remarkable parallel and contrast between Adam and Christ as representations of fallen and saved humanity. The relation in both instances is at once representative and vital. Hence chap. v. 12-21 is not an episode, but

leads the way to the discussion in chaps. vi.-viii., in which the gospel is shown to be the power of God unto salvation, over against sin (chap. vi.), over against the powerless law (chap. vii.), and as introducing a new life of the Spirit over against the life of the flesh. The term "flesh," here and in Galatians, is readily shown to be ethical, not merely referring to the physical side of man's nature; mistakes on this point have led to asceticism and to misapprehensions of Paul's anthropology. It is implied, though not directly asserted, that the life in the flesh stands related to Adam, the life in the Spirit to Christ. Human nature as a whole, turned away from God, constitutes the "flesh." The Holy Spirit renews this human nature and it becomes "spirit." Hence it is sometimes difficult to determine whether Paul refers to the personal Holy Spirit or to the renewed spirit in which the Holy Spirit dwells. This Holy Spirit is given to the justified believer, and thus he triumphs; nothing can separate him from the love of God. Chaps. ix.-xi. discuss with profound pathos the unbelief of the Jews, and rest the difficult problems on the sovereignty of God in chap. ix., but in chap. x. on the unbelief of the Jews. The prospective solution of the dark mystery is given in chap. xi.; the triumph of the gospel will yet be universal, ever of grace and by faith.

The practical exhortations have some reference to special matters, notably the scruples about eating (chaps. xiv.-xv. 13), which divided the Roman believers into "strong" and "weak," the former having no scruples, the latter disposed to judge their freer brethren. The principles here laid down remain of permanent validity. The conclusion of the epistle (xv. 14-xvi.) reverts to the apostle's plans of visiting Rome, and then follow (in chap. xvi.) a number of somewhat detached passages; greetings and doxologies. It is this chapter that has occasioned the main critical question respecting the Epistle to the Romans.

4. The integrity of the epistle. The doxology (xvi. 25-27) is found at the close of chap. xiv. in one uncial MS. and in many cursives, and in both places in the Alexandrian MS. and a few others. No authorities omit chaps. xv., xvi., though Marcion rejected them. This variation in position, despite Schürer's assertion, is not sufficient to prove that the doxology is not genuine. The objection of Baur to chap. xv. is of no weight. That Paul wrote chaps. xv. and xvi. is well-nigh certain. But did they form a part of the Epistle to the Romans? Certainly this is by far the most probable view. No serious objection arises from the names occurring in chap. xvi.: Priscilla and Aquila travelled a great deal, and the great number of acquaintances in Rome need occasion no surprise. The view that this chapter was a postscript addressed to Ephesus, intended for Phœbe, or as an appendix to a copy of the Roman epistle sent to that city, is plausible, but lacks proof. Bishop Lightfoot thinks a briefer form (without chaps. xv., xvi.) was sent to other churches, probably by the apostle himself. Other theories have been suggested, but the Roman destination of the entire epistle is in every way most probable, however the phenomena in the Greek text are accounted for.

II. The Epistles of the Roman Imprisonment.—This group consists of four letters: Ephesians, Colossians, Philemon, and Philippians; three of them undoubtedly written about the same time, and sent by the same person or persons.

1. The three epistles, Ephesians, Colossians, and Philemon, have been fully and fairly discussed in the *BRITANNICA*. The genuineness of all is defended; the place of writing has been assigned to Rome, not Cæsarea, and the questions of similarity, etc., handled with fulness and candor. The main perplexity grows out of the reference in Col. iv. 16 to "the epistle from Laodicea," and the absence of the phrase "in Ephesus" from the text of important MSS. in Eph. i. 1. The current opinion now is that the Ephesian letter was intended to be circulated in other churches, and

that this letter is referred to in Col. iv. 16. But that it was designed for Ephesus first seems on the whole most probable. These epistles give no indication of the previous conflict with Judaizers, and reveal a higher stage of theological thought, dwelling more on Christological and ecclesiastical truths. This would favor the view defended by Bishop Lightfoot, that they belong to the later period of the Roman imprisonment (see below), but the views here presented by the apostle do not of themselves prove this.

2. The Epistle to the Philippians.—The occasion, purpose, and contents of this epistle are fairly set forth in the *BRITANNICA*, but on two points supplementary statements seem called for.

(1) The date. Until recently this epistle was regarded as the last one written during the first imprisonment at Rome. But the influence of Bishop Lightfoot has made a change in the opinion of English Biblical scholars. He reverses the order, basing his argument mainly upon the resemblance of Philippians to Romans, and the advanced development in the church implied in the other epistles. On this we may remark, as in the similar question respecting Galatians, that the presence of the same thoughts and language does not establish nearness of date. The Epistle to the Philippians indicates a more fully developed church organization than do the others, and it is this, rather than the development (if it may be so termed) of the apostle's thought, that gives the most positive argument in regard to the time of writing. Bishop Lightfoot himself has shown the importance of this epistle for questions of church polity. (See his Dissertation on the Christian Ministry, *Commentary on Philippians*, pp. 181-269.) In favor of the usual view, despite his exceptions, there may still be urged the following reasons: (a) the enlarged condition of the Christian community at Rome; (b) the length of time called for by the various journeys alluded to in the epistle; (c) the companions of Paul at the time of writing; (d) the tone of the epistle, indicating a sense of weariness in captivity, etc. It is impossible to do more than name these reasons, which have been regarded by most scholars as convincing.

(2) The important Christological passage in chap. ii. 5-11 is deprived of much of its force in the *BRITANNICA*. The meaning is fairly given in the revised version, and most of those who are not prejudiced against the view commonly taken of the Person of Christ will accept the following paraphrase of Lightfoot (vers. 6, 7), as fairly explaining the apostle's statement: "Though existing before the worlds in the Eternal Godhead, yet he did not cling with avidity to the prerogatives of his divine majesty, did not ambitiously display his equality with God; but divested himself of the glories of heaven, and took upon him the nature of a servant, assuming the likeness of men." This paraphrase of Lightfoot accords with the rendering (and marginal notes) of the revised version, as can readily be perceived. The question respecting the phrase "emptied himself" (ver. 7) has been very fully discussed, and the phrase has given rise to the terms "Kenosis" and "Kenotists," as applied to certain views of the Incarnation. So far as the statement of ver. 6 is concerned, if we are in doubt as to the apostle's view here, we can scarcely trust the results of historical exegesis. It is quite unfortunate that the authorized version, by its faulty rendering ("thought it not robbery to be equal unto God"), has made it more difficult to explain the full force of the apostle's argument. The divinity of the pre-incarnate Word is far more fully set forth by the correct rendering: "counted it not a prize to be on an equality with God."

We may add that the genuineness of this epistle cannot be denied with any good reason.

The pastoral epistles have already been discussed (see PASTORAL EPISTLES). The present article has been made to cover only those epistles and questions that seemed to require supplementary remark.

Literature.—The *BRITANNICA* in the earlier volumes gives due attention to English and American works on the Pauline epistles, but the more recent volumes almost entirely ignore these. The fullest discussions will be found in the American edition of *Lange's Commentary, New Testament* (vols. v.-viii.). The articles in *Smith's Bible Dictionary* (Am. edition) are quite full on all the historical questions, and contain valuable lists of commentaries; P. J. Gloag, *Introduction to the Pauline Epistles*. For English readers there have been published a number of commentaries of a popular character, aiming to bring out the exact meaning of the epistles and to set forth the historical questions. Among them the *Speaker's* and those of Schaff and Ellicott rank high. An explanation of *Romans* by the present writer, based on the revised version, was published as a part of *International Revision Commentary* (N. Y., 1884.)—For students of the Greek Testament may be recommended the Commentaries of Ellicott (1 *Corinthians*, *Galatians*, *Ephesians*, *Colossians*, *Thessalonians*, and *Pastoral Epistles* have already appeared); Lightfoot (*Galatians*, *Colossians*, *Philippians*); Godet (*Romans*, 1 *Corinthians*); C. Hodge (*Romans*, *Corinthians*, *Ephesians*); Vaughan (*Romans*), and many others. (M.B.R.)

ROME, a city of New York, half-shire of Oneida co., is situated on the Mohawk River, 15 miles west of Utica, at the junction of the New York Central, the New York, Ontario, and Western, and a railroad to Ogdensburg. Here, also, is the junction of the Erie and Black River Canals. It has a fine court-house, opera-house, 4 national banks, 1 daily and 3 weekly newspapers, 16 churches. The industrial works comprise iron, brass, copper, knitting, lumber, and other mills and factories. The town is handsomely laid out, with wide, well-shaded streets and flagged sidewalks. It is lighted with gas and has water-works. The total valuation of property is \$6,000,000. Rome was first settled in 1765, being at the portage between the Mohawk River and Wood Creek, which gave an outlet to the St. Lawrence. Here was Fort Stanwix, of Revolutionary fame, whose successful defence prevented St. Leger's division of Burgoyne's army from invading the Mohawk Valley. During the siege the battle of Oriskany (6 miles east) was fought August 6, 1777, in which Gen. Nicholas Herkimer was killed. Rome received a city charter in 1870. Its population in 1880 was 12,194.

ROMERO, MATIAS, Mexican diplomatist, was born at Oaxaca, Feb. 24, 1837. After commencing the study of law there he was admitted to the bar in 1857 in the city of Mexico. He attached himself to the party of Juarez, who employed him in the office of foreign affairs. In December, 1859, he was made secretary of the Mexican legation at Washington, and afterwards became chargé d'affaires. In May, 1863, he went to Mexico on the French invasion, and became chief of staff to Gen. Porfirio Diaz, but returned to Washington a few months later. After the defeat of Maximilian's attempt to establish an empire Romero negotiated several important treaties with the United States. In August, 1868, he was made minister of finance in Juarez's cabinet, but was obliged to retire from this post by ill-health. After some service in the Mexican Congress he resumed charge of the finances in 1876 under Pres. Diaz, but retired again in 1879. He was afterwards postmaster-general for a brief period, but in 1881 he became general superintendent of the Mexican Southern Railway, and accompanied Gen. Grant in his visit to Mexico. Romero was soon sent again as minister to Washington, especially to adjust boundary disputes, and in 1884 was reappointed by Pres. Diaz. During his long diplomatic service he has prepared many valuable reports on important public questions.

RONGE, JOHANNES (1813-1887), leader of a German Catholic movement, was born Oct. 16, 1813, at Bischofswalde, Silesia. He was educated at the University of Breslau and studied theology there. In 1841 he was made chaplain at Grottkan, but was soon removed from this post on account of some publications in Saxon papers. He then became a teacher, but in 1844 he wrote a letter denouncing the exhibition of

the Holy Coat of Treves. The controversy excited by this caused Ronge to withdraw from the Roman Church and attempt to establish a German Catholic Church. His most effective supporter at first was Czerski, who was, however, less radical in views than Ronge, so that eventually they separated. Ronge's movement assumed a political aspect, and in 1849 he was compelled to flee to London, where he busied himself in introducing Fröbel's new ideas on education. In 1861 he was permitted to return to Breslau, but soon went to Frankfort, where he issued many pamphlets in behalf of a Reform-Union, in which Protestant rationalists were to be included. In 1873 he removed to Darmstadt and established *Neue Religiöse Reform* to propagate his views. He died Oct. 27, 1887.

ROON, ALBRECHT THEODOR EMIL, COUNT VON (1803-1879), German general, was born April 30, 1803, and after receiving a military education entered the Prussian army in 1821. He pursued the higher military studies from 1824 to 1827, and then became teacher of the cadets. Regularly advanced from grade to grade he became colonel in 1851, major-general in 1856, lieutenant-general in 1859. He had then charge of the mobilization of the army when Prussia was making ready to interfere in the war of Italian independence, though the work was cut short by the treaty of Villafranca. In December, 1859, he was called to the ministry of war, and in April, 1861, to the ministry of the marine, to which, in December, the former was joined. In the long struggle which ensued between the government and the Landtag Gen. von Roon supported with vigor the plans of King Wilhelm, and co-operated with Count Bismarck in carrying through the reorganization of the army. The Schleswig-Holstein campaign of 1864 and the Austro-Prussian war of 1866 gave full proof of his abilities, and the king honored him with the cross of the Black Eagle. Again in 1870 he displayed the same signal ability in the war with France, and the fiftieth anniversary of his entrance into the military service was celebrated with pomp at Versailles in 1871. On his return to Berlin he was made a count, but he resigned the ministry of the marine at the close of 1871. He had been for some time opposed to Bismarck's policy, by which Prussia, so long the leader of Germany, was to become simply a large state in a grand empire. Count von Roon was not disposed thus to sacrifice the position of Prussia, but the current of events was too strong for him. His military eminence was still recognized when he was made field-marshal, Jan. 1, 1873, and he was soon after made president of the Prussian cabinet, but in November he resigned his post and retired from public life. He died at Berlin, Feb. 23, 1879.

ROSA, EUPHROSYNE PAREPA (1836-1874), singer, was born at Edinburgh, Scotland, May 7, 1836. Her father was a Wallachian nobleman, and her mother Elizabeth Seguin, who afterwards became a noted singer. The daughter was trained for the operatic stage in Italy, and began her professional career at Malta in 1855. After tours in Italy and Spain she went to London in 1857, where her talent was found best suited to oratorio and concert. In 1863 she was married to Capt. H. D. Carvell, of the British army, but after his death, having lost her property by an unfortunate investment, she made an engagement with a concert company to perform in the United States. Her first appearance was at Irving Hall, New York, in September, 1865. In February, 1867, she was married to Carl Rosa, violinist and member of the same company. With him in 1869 she organized an English opera, which for three seasons made tours of the chief American cities. In 1872 she joined the Italian opera company formed at Cairo by the Khedive of Egypt. With her husband she afterwards made a tour in England, and, when about to return to the United States, she died at London, Jan. 21, 1874. Parepa Rosa was large in person and handsome in countenance. Her

voice was a soprano, with a compass of two and a half octaves.

ROSCHER, WILHELM, German political economist, was born at Hanover, Oct. 21, 1817. His university training was received at Göttingen and Berlin, and after habilitating himself at the former he was in 1843 made professor extraordinary, and in 1844 professor ordinary there. In 1848 he was called to Leipsic, and has there continued to lecture. He was the originator and leading advocate of the historical method of national economy, which has steadily gained on the "philosophical," or *a priori* method long in vogue. This system is well described under **POLITICAL ECONOMY** in the **ENCYCLOPÆDIA BRITANNICA**, and its method is indeed the basis of that article. Economics are by it regarded as but one department of the larger science of sociology, but in vital connection with the other departments. The state and its industrial, commercial, and political development are but one side of the life of the people, while the other includes their art, literature, and other products of their civilization, and the study of the whole is essential to scientific investigation of any part. On entering his professorship in 1843 Roscher issued an outline of his views, which he afterwards developed in numerous publications of various kinds. These include *Umriss zur Naturlehre der Staatsformen* (1847); *Geschichte der englischen Volkswirtschaftslehre im 16. und 17. Jahrhundert* (1851); *Kolonien, Kolonialpolitik und Auswanderung*, of which several editions have appeared; *Ansichten der Volkswirtschaft aus dem geschichtlichen Standpunkte* (1855); *Die deutsche Nationalökonomie an der Grenzscheide des 16. und 17. Jahrhunderts* (1862). His most important work, however, is his *System der Volkswirtschaft*, which began to appear in 1854, and was completed by the third volume in 1881, while in the meantime several editions of the earlier volumes had been issued, and the author had supplemented it with his *Geschichte der Nationalökonomie in Deutschland* (1874).

ROSCOE, SIR HENRY ENFIELD, English chemist, grandson of the historian William Roscoe, was born in London, Jan. 7, 1833. From an early age he evinced an inclination for the physical sciences. When he graduated at the University College, London, in 1852, he took the prize in chemistry and became assistant to Prof. Williamson. In 1854 he went to Heidelberg and studied with the famous chemist, R. W. Bunsen. His most important research at this time was his measurement of the chemical action of light, for which he finally devised an automatic method. In 1857 he was made professor of chemistry in Owen's College, Manchester, where he succeeded in forming excellent, well-equipped laboratories. In 1870 he was made president of the chemical section of the British Association at its meeting in Liverpool. He has been an earnest advocate of technical education, and for many years delivered in Manchester a course of popular lectures on science. In 1878 the University of Dublin conferred on him the degree of LL.D. In 1880 he was chosen president of the Chemical Society, London. In 1881 he founded the Society of Chemical Industry. In 1882 he was made president of the Literary and Philosophical Society of Manchester. In 1884 he received the honor of knighthood. In 1885 he was elected to Parliament from South Manchester as a Liberal. His publications include *Lessons in Elementary Chemistry* (1866), *Lectures on Spectrum Analysis* (1869; 4th ed., 1885), and a *Chemistry Primer*, which has been translated into many languages. His most important work is the *Treatise on Chemistry* (4 vols., 1877-85), in which he was assisted by Prof. Schorlemmer.

ROSE is the common name of a genus of bushy and prickly shrubs, the type of the natural order *Rosacea*, which comprises many useful and ornamental plants. The cultivated rose, of which there are very numerous varieties, is the most highly esteemed of

garden plants for beauty and fragrance. All its varieties were formerly supposed to be derived from one species, but it is now believed that they represent several species. North America has many species of native roses with single flowers, as is generally the case with wild roses, but some of them of much beauty. One of the most interesting of these is *R. setigera*, the climbing or prairie rose. This sends up shoots of 10 to 20 feet high in a single season, and bears flowers of a deep rose color, and leaves with from 3 to 5 sharply serrated leaflets. The stems are armed with stout, nearly straight, prickles. It is the only American climbing rose, and is found on the borders of prairies and thickets from Ohio to Illinois, and southward to the Gulf States. In cultivation it has yielded many double-flowered varieties, known as prairie roses, of which may be named the Queen of the Prairies and the Baltimore Belle.

The Swamp rose (*R. Carolina*) is a common species in low grounds from Florida to North Carolina and westward. It grows from 4 to 8 feet high, the stem bearing stout, hooked prickles. The rose-colored flowers are numerous, borne in corymbs. *R. lucida*, the dwarf wild rose, is another very common species, it being found in dry soils and

Prairie Rose.

on swamp borders from the Gulf States northward. *R. blanda*, the early wild rose, extends from Vermont to Pennsylvania, and westward to the Rocky Mountains. Its stem is nearly unarmed, its flowers of a light rose color. *R. laevigata*, the Cherokee rose, has a long, trailing, smooth stem, the branches being armed with stout, curved prickles. The flowers are large, solitary, and white. This species is common in cultivation, and is valued as a hedge plant from its quick growth, strength, durability, and beauty. The Rocky Mountain and Pacific coast region has six or seven species of native roses. Our naturalized roses include *R. rubiginosa*, the European sweet briar, a high-climbing plant, which affects road sides and thickets, and *R. micrantha*, the smaller-flowered sweet briar, which is found in eastern New England. The principal rose pests of the United States are the thrips, the rose-bug, the aphid, and the red spider. They may be eradicated by a strong solution of soap in water of 100° temperature, applied by syringing twice a week.

ROSEBERRY, ABCHIBALD PHILIP PRIMROSE, EARL, a British statesman, belonging to an ancient Scotch family, was born May 7, 1847. When he was four years old his father died, and he succeeded to his title in 1868 on the death of his grandfather. He had

See Vol. XX, p. 850 (p. 873 Am. Rep.).

been educated at Eton and Christ Church College, Oxford, but left without graduating. He had indulged in racing and other sports, and spent some time in travelling on the Continent. On entering the political field as a Liberal he became noted as a speaker. He took special interest in the educational affairs of Scotland, and he advocated a reform of the House of Lords. In 1871 he was lord rector of the University of Aberdeen, in 1874 he presided at the social science congress held at Glasgow, and in 1880 he was chosen rector of the University of Edinburgh. In August, 1881, he was made under-secretary of state for foreign affairs, and he held this office until June, 1883. In the Gladstone cabinet in 1886 he was secretary of state for foreign affairs. On March 20, 1878, he married Hannah, only daughter of Baron Rothschild.

ROSECRANS, WILLIAM STARKE, general, was born at Kingston, Ohio, Dec. 6, 1819. His father had served as an adjutant in the war of 1812. The son graduated at West Point in 1842, and entered the engineer corps. He was assistant-professor of engineering for some years, and in 1847 he took charge of the repairs at Fort Adams, near Newport, R. I. Resigning in 1854 he became a civil engineer at Cincinnati, and was engaged in coal-mining and kerosene-manufacture. An explosion of kerosene caused such injuries that he was confined to bed for eighteen months. In April, 1861, he offered his services to Gen. McClellan as volunteer-aid, but in June, just after being appointed chief engineer of the State of Ohio, he took command of the Twenty-third Ohio volunteers. He led a brigade into West Virginia, and fought at Rich Mountain, July 11. His commission as brigadier-general, U. S. army, was made to date from May 16. He had command of the department of Ohio until September, when, by a new arrangement, his command was called the department of West Virginia. In April, 1862, he joined Gen. Buell's army, and at the siege of Corinth he commanded a division. After the capture of Corinth he had command of the Army of the Mississippi, and defeated Gen. Sterling Price at Iuka, Sept. 19, but let him escape. Price united with Van Dorn, but Rosecrans successfully defended Corinth against their joint attack. (See CORINTH.)

In October, 1862, the command of the Army of the Cumberland, then gathered around Murfreesboro, Tenn., was assigned to Rosecrans. On Dec. 31, 1862, his camp at Stone River was attacked by Gen. Bragg as a preliminary to an invasion of Kentucky. For a time the attacking force gained great advantages, but Rosecrans by great personal exertions rallied his shattered troops, and finally on Jan. 2, 1863, repulsed the Confederates, who had well-nigh achieved a victory the day before. (See STONE RIVER.) In the spring following Rosecrans was slow to take the field against Bragg, who was then at Shelbyville. Precious time was lost in making preparations, far beyond what the occasion required, against dangers in front and rear. But the real danger that the Confederate force then employed in watching and resisting Grant's operations against Vicksburg should be released to reinforce Bragg was comparatively neglected. It was not until the end of June, after frequent orders and remonstrances from Washington, that Rosecrans advanced to Tullahoma. Bragg had retreated rapidly, and a month later Rosecrans took Bridgeport on the Tennessee. The month of August was frittered away, and on Sept. 4 Rosecrans crossed the Tennessee to engage the large Confederate force, which had now been gathered near Chattanooga. The operations in this vicinity have been described under CHICKAMAUGA (q. v.).

In consequence of this defeat Gen. Rosecrans was relieved of his command by Gen. Grant, Oct. 16. In January following he was placed in command of the department of Missouri, during which the invasion of Gen. Sterling Price was repelled. After the close of the war Rosecrans received the brevet of major-general, but he resigned from the army March 23, 1867. In

the next year he was for some months U. S. minister to Mexico, and was afterwards Democratic candidate for governor both in California and Ohio. In 1881 he was elected to Congress from California, and served two terms. He was made register of the U. S. treasury in June, 1885.

Gen. Rosecrans' campaigns in Tennessee have been the subject of much military criticism, but the fair conclusion seems to be that, though he is a strategist of high order, and capable of drafting beforehand excellent plans of a campaign, he is deficient in the necessary force to carry them through in spite of moral and physical obstacles, and in the mental quickness to improvise new movements required by emergencies. In his subsequent political career he took several opportunities to vindicate his cause without materially altering the popular judgment. His character and career bear a marked resemblance to those of McClellan.

His brother, SYLVESTER HORTON ROSECRANS (1827-1878), graduated at Kenyon College in 1845, and became a Roman Catholic through William's example. He graduated at St. John's College, Fordham, N. Y., and received a doctor's degree at Rome in 1851. Returning to the United States with priest's orders he conducted a college at Cincinnati, and there edited the *Catholic Telegraph*. In March, 1862, he was consecrated and became assistant to Bishop Purcell, and in 1865 bishop of Columbus, Ohio. There he built St. Mary's cathedral, and carried on the ecclesiastical work with great vigor.

ROSENKRANZ, JOHANN KARL FRIEDRICH (1805-1879), a German philosopher, was born at Magdeburg, April 23, 1805. He studied at Berlin, Halle, and Heidelberg, and became professor extraordinary at Halle in 1831. Two years later he was called to the University of Königsberg as professor, and he held this position until his death, June 14, 1879. He was a member of the ministerial council at Berlin in 1848. His literary activity was very great, and his field extensive. He began with a *History of German Poetry in the Middle Ages* (1830), and an *Encyclopædia of Theological Science* (1831). In explanation and support of Hegel's philosophy he published many works, of which the principal is his *Psychology, or Science of the Subjective Spirit* (1837). He also published *Paedagogik als System* (1843), which has been translated as *Philosophy of Education*. Other works are *Poetry and its History* (1855); *Science of the Logical Idea* (2 vols., 1858-59); *Life and Works of Diderot* (2 vols., 1866); a *History of Kantian Philosophy* (1840), which was the concluding volume of an edition of Kant's *Works*; and a *Life of Hegel* (1844) as a similar supplement to Hegel's *Works*. His latest work was *Neue Studien* (1877). His *Diary*, extending from 1833 to 1846, was published in 1854.

ROSENMÜLLER, ERNST FRIEDRICH KARL (1768-1835), German Biblical commentator, was born at Hessburg, near Hildburghausen, Dec. 10, 1768. His father, JOHANN GEORG ROSENMÜLLER (1736-1815), was a noted Lutheran professor of theology, and published *Scholia in Novum Testamentum* (6 vols.), which passed through several editions. The son was professor of Oriental languages at Leipzig, and published *Scholia in Vetus Testamentum* (23 vols., 1788-1835). He afterwards assisted in the preparation of a Latin abridgment of this work (5 vols., 1828-35). He had also prepared a work on Biblical antiquities (4 vols., 1823-31). He died at Leipzig, Sept. 17, 1835.

ROSS, ALEXANDER MILTON, naturalist, was born at Belleville, Ontario, Canada, Dec. 13, 1832. While a boy he went to New York, and was a compositor in the office of the *Evening Post*. In 1851 he began to study medicine, and obtained the degree of M. D. in 1855. He then took an active part in anti-slavery agitation, and on the outbreak of the civil war in 1861 he was for a time a surgeon in the Union army. Later he served at Montreal as a confidential correspondent

of Pres. Lincoln. He afterwards became a member of the College of Physicians and Surgeons there, but devoted his attention chiefly to the natural history of Canada. In 1881 he was one of the founders of the Society for the Diffusion of Physiological Knowledge. He is now treasurer and commissioner of agriculture of the province of Ontario. His publications include *Recollections of an Abolitionist* (1867); *Birds of Canada* (1872); *Butterflies and Moths of Canada* (1873); *Flora of Canada* (1873); *Forest Trees of Canada* (1874); *Mammals, Reptiles and Fresh-water Fishes of Canada* (1878).

ROSS, GEORGE (1730-1779), signer of the Declaration of Independence, was born at Newcastle, Del., in 1730. He became a lawyer, and was chosen to the Pennsylvania Legislature in 1768. While still holding this position he was chosen to the First Continental Congress in 1774. He retired from Congress in 1777, and in April, 1779, was made a judge of the Pennsylvania court of admiralty, but died in July.

ROSS, JOHN (1790-1866), a Cherokee chief, was a half-breed, born in Georgia. He had acquired an English education, and rose to be principal chief of the Cherokees in 1828. The State of Georgia was then endeavoring to dispossess the tribe of their lands, and Ross stoutly resisted this movement, but a small minority of the tribe led by a Major Ridge were induced to consent to a treaty binding all to remove west within two years. Ross and over two-thirds of the tribe protested, and appealed to the President, but in vain. They were compelled to submit, and Gen. Winfield Scott succeeded in effecting the removal without bloodshed. The factions in the tribe continued, but Ross retained his position as principal chief. In 1861 he made a treaty with the Confederate States, and the Cherokees fought at Pea Ridge. But afterwards Ross joined the Union side. He died at Washington, D. C., Aug. 1, 1866.

ROSSI, GIOVANNI BATTISTA DE, an Italian archaeologist, was born at Rome, Feb. 23, 1822, and was educated at the Roman College. He studied archaeology under the learned Jesuit Marchi, and devoted himself especially to Christian antiquity. To Rossi's labors is due the exploration of the catacombs, the results of which appeared in his *Roma Sotterranea Cristiana* (3 vols., 1854-77), and in his *Bullettino di archeologia Cristiana*. He also published *Inscriptiones Christianæ urbis Romæ septimo sæculo antiquiores* (1861), and a handsomely illustrated work, *Muraici Cristiani e Saggi di Pavimenti delle Chiese di Roma*. He is the president of the Papal Academy of Archaeology, and is a member of many learned societies. He has contributed also to the department of classical archaeology. His monographs and minor publications are numerous.

ROTHERMEL, PETER FREDERICK, painter, was born at Nescopeck, Luzerne co., Pa., July 18, 1817. He was originally a land-surveyor, but went to Italy in 1836 and became a portrait-painter. Still later he devoted himself to historical painting. Among his works are Columbus before Queen Isabella, The Christian Martyrs in the Colosseum, De Soto discovering the Mississippi, Patrick Henry in the Virginia House of Burgesses. For the State of Pennsylvania he painted on a large canvas The Battle of Gettysburg.

ROUGÉ, OLIVIER CHARLES CAMILLE EMMANUEL, VICOMTE DE (1811-1872). French Egyptologist, was born at Paris, April 11, 1811. His father, a colonel, had intended him for a career in governmental service, but the revolution of 1830 broke up his plans. The son then resided on the family estate in Anjou until his love of philological study brought him back to Paris. After a general excursion in the field of Oriental literature he devoted himself to the investigation of Egyptian hieroglyphics for eight years. In 1844 his first publication attracted the attention of Letronne and Biot. In 1849 he was made keeper of the Egyptian Museum of the Louvre, of which he pub-

lished a catalogue. In 1854 he was obtained a position in the department of public instruction, and in 1860 he was made a professor of archæology in the Collège de France. He died at Bois-Dauphin, Dec. 27, 1872. His chief work is *Rituel funéraire des anciens Égyptiens* (4 vols., 1861-68). He published also a *Chrestomathie égyptienne* (3 vols., 1867-73), *Recherches sur les monuments qu'on peut attribuer aux six premières dynasties de Manéthon* (1866) and various monographs. He maintained the Egyptian origin of the Phœnician alphabet in a memoir which was published by his son in 1874.

ROUSSEAU, LOVELL HARRISON (1818-1869), major-general, was born in Lincoln co., Ky., Aug. 4, 1818. His father was first cousin to Pres. W. H. Harrison, and died when Lovell was but thirteen years old. He had already left school, but afterwards studied law at Louisville, and was admitted to the bar at Bloomfield, Ind. In 1844 he was elected to the Legislature in that State and on the outbreak of the Mexican war he became captain in a regiment which fought under Gen. Taylor. On his return he entered the State Senate as a Whig, but he soon removed to Louisville, where he became conspicuous as a criminal lawyer. In 1860 as a member of the Kentucky Senate he took a firm stand against all movements tending to secession, and later against the proposed neutrality of the State. Raising two regiments of Union men, he formed "Camp Joe Holt" in Indiana, and when the time for action came led them into Kentucky. Having been appointed brigadier-general U. S. volunteers, Oct. 1, 1861, he marched in Buell's army to the battle of Shiloh, where he distinguished himself, April 7, 1862. For gallantry at Perryville, Ky., Oct. 8, 1862, he was promoted major-general, and at Murfreesboro, Dec. 31, 1862, he was again conspicuous. He fought at Chattanooga and Chickamauga, and in November, 1863, was appointed to command the district of Tennessee. Resigning two years later, he was elected to Congress, where he supported the reconstruction policy of Pres. Johnson. In 1867 he was commissioned brigadier-general in the regular army, and was assigned to the newly purchased Alaska, but in July, 1868, he was put in command of the department of Louisiana. He died at New Orleans, Jan. 8, 1869. He was noted for his physical strength and chivalrous courage.

ROUTH, MARTIN JOSEPH (1755-1854), English divine, was born at South Elmham, Suffolk, Sept. 15, 1755. He graduated at Oxford in 1774 and held various college positions, becoming finally president of Magdalen College in 1791, and retaining that office for sixty-four years. He edited some of Plato's Dialogues, Burnet's *History*, and *Scriptorum Ecclesiasticorum Opuscula* (1832). His chief work was a collection of the fragments of the Christian writers previous to the Council of Nice, *Reliquiæ Sacræ* (4 vols., 1814-18; revised ed., 5 vols., 1846-48). He died in his hundredth year, Dec. 22, 1854.

ROWAN, STEPHEN CLEGG, admiral, was born near Dublin, Ireland, Dec. 25, 1808. He was brought to the United States at an early age and received appointment as midshipman in the navy in 1826. He became lieutenant in 1837 and was engaged in the coast survey in 1838-40. During the Mexican war he had command of the sloop Cyane on the Pacific coast and took part in the capture of Monterey and San Diego in California, as well as capturing and destroying Mexican vessels. Under Com. Stockton he led a naval brigade in an expedition to the interior and received a slight wound. At the outbreak of the civil war he held the rank of commander and though his residence was at Norfolk, Va., where he had married, he remained faithful to the Union. With the steam-sloop Pawnee he performed efficient service on the Potomac and afterwards on the coast of North Carolina, where he conducted several expeditions until its waters were brought securely under Union control. He was made commodore in July, 1862, and afterwards had com-

mand of the New Ironsides off Charleston until the spring of 1864, when he was relieved. In 1866 he was made rear-admiral and took command of the Norfolk navy-yard. In 1868 he was made commander of the Asiatic squadron and received the rank of vice-admiral. He afterwards had charge of the navy-yard at New York, the naval asylum at Philadelphia, and the naval observatory at Washington. Since 1883 he has been chairman of the Lighthouse board.

RUBINSTEIN, ANTON, Russian pianist and composer, was born at Wechotynetz, Roumania, Nov. 30, 1830. He was taken to Moscow in childhood and early appeared in public as a performer. At the age of ten he went to Paris for instruction, but also performed at concerts, Liszt giving him advice and encouragement. Rubinstein visited England, Sweden, and Germany, and for a time studied composition in Berlin. Then he began to teach, and having returned to Russia was appointed pianist to the Grand Duchess Helena and director of the concerts of the Russian Musical Society. In 1868 he again visited Paris and London, achieving a brilliant success both as pianist and composer. In 1872 he made a tour in the United States and he has since devoted himself to composition. Among his operas are *Dimitri Donskoi*, *Les Chasseurs Sibériens*, *Lalla Rookh*, and *Nero*. His oratorio, *Paradise Lost*, has been performed with great success. *The Maccabees*, a sacred drama, was performed in 1878.

RUFFNER, HENRY (1788–1861), Presbyterian minister and educator, was born in 1788, and entered the ministry in 1813. After holding various pastorates he was made president of Lexington College, Va., in 1837. He exerted himself for the advancement of education and in 1860 he advocated the abolition of slavery in Virginia. He died at Kanawha, Dec. 17, 1861. He wrote a romance called *Judith Bensaddi*, and *The Origin and Practice of Monks* (2 vols., 1850).

RUMSEY, JAMES (1743–1792), machinist, was born at Bohemia Manor, Cecil co., Md., in 1743. He was employed in the construction of flour-mills and made various improvements in machinery. After the Revolutionary war several ingenious men directed their attention to this subject and soon there was discussion about the application of steam. Oliver Evans (*q. v.*), who had made great improvements in mills, invented the high-pressure steam-engine and endeavored to make a steam-wagon for ordinary roads. John Fitch (see *ENCYCLOPEDIA BRITANNICA*) invented a steam-boat, but by want of means was long delayed in bringing it into practical operation. Rumsey had in September, 1784, exhibited on the Potomac a boat moved by mechanical devices up-stream. Gen. Washington is said to have been present at the exhibition, but does not appear to have given it serious thought. Afterwards Rumsey introduced steam-power into his boat and obtained in 1787 a patent from the State of Virginia for steam-navigation within its waters. Evans obtained a similar patent from Maryland, and Fitch from Pennsylvania and other States. State jealousy and political feeling were greatly excited over the rival claims. Rumsey enlisted the aid of Franklin and published at Philadelphia a treatise on the application of steam. A Rumsey Society was formed at Philadelphia in 1788 in his behalf, and Fitch, rough in speech and appearance, lost public favor. Rumsey went to England, where he received some attention and built a steam-boat, which made a successful trip on the Thames. A few days afterwards he died at London, Dec. 23, 1792. Rumsey had obtained patents for steam-navigation from England and France, but his projects expired with him. It remained for Robert Fulton with the generous aid of Livingston to put in successful operation the ideas of his unfortunate predecessors.

RUSH, BENJAMIN (1746–1813), is appropriately recognized in the *ENCYCLOPEDIA BRITANNICA* as the Sydenham of America.

His son, **JAMES RUSH**, born at Philadelphia, March 1, 1786, graduated at Princeton in 1805, and adopted

his father's profession. According to the custom of the time, after receiving his degree from the University of Pennsylvania in 1809, he pursued further study of medicine in Edinburgh. After entering on practice in Philadelphia, he married the daughter of Thomas Ridgway, and thus acquired a princely fortune. His wife was long a brilliant leader of society, while he in later years preferred the seclusion of his library. His work on the *Philosophy of the Human Voice* (1827) was the first thorough discussion of its subject, and still has great value. His other writings were *Hamlet, a Dramatic Prelude* (1834); an *Analysis of the Human Intellect* (2 vols., 1865); and *Rhymes of Contrast on Wisdom and Folly* (1869), a satirical dialogue. He died May 26, 1869. By his will he left his estate to the Philadelphia Library, yet on such peculiar conditions that the wisdom of accepting it was doubtful. He had spent the bulk of the bequest in purchasing a full square of ground on Broad street and erecting a massive granite building, leaving a comparatively small sum for the purchase of books. The building is occupied by the Ridgway branch of the library, but the inconvenience of its location has prevented it from being of real benefit even to students. Dr. Rush's will requires the library to issue every ten years in the next half century an edition of his own writings to be sold at cost-price.

RUSH, RICHARD (1780–1859), diplomatist, brother of the preceding, was born in Philadelphia, Aug. 29, 1780. Graduating at Princeton in 1797, he entered in the study of law. His first noted case was his defence of William Duane who was charged with libel on Gov. Thomas McKean. In January, 1811, he was made attorney-general of Pennsylvania, and before the close of the year comptroller of the U. S. treasury. In 1814 he was appointed U. S. attorney-general, and he served for a time as secretary of state under Pres. Monroe, by whom he was sent as minister to England. There he negotiated several important treaties, especially that of 1818, relating to the North Atlantic fisheries and the North-eastern boundary. After eight years spent in this capacity, Rush was recalled by his friend, John Quincy Adams, who had risen from the secretaryship of state to be President, and wished to employ his services in the treasury. Three years later their names were joined on a presidential ticket, which failed of acceptance by the people. Rush then used his influential foreign acquaintance to obtain loans for the city of Washington and other places. In 1836, being appointed by Pres. Jackson to secure from the British courts the legacy of James Smithson to the United States, he obtained the full amount, \$515,169, which has been the basis of the Smithsonian Institution. In 1847 he was sent by Pres. Polk as minister to France, and remained until 1849. Returning to Philadelphia, he died there ten years later, July 30, 1859. In early life he edited the *Laws of the United States* (5 vols., 1815) and wrote many political articles. In 1833 he published his *Narrative of a Residence at the Court of St. James*, to which he added a second volume in 1845. A new edition appeared in 1873. He also published *Washington in Domestic Life* (1857) and his executors issued a volume of his *Occasional Productions* (1860).

RUSK, THOMAS JEFFERSON (1802–1856), politician, was born in South Carolina, but early removed to Georgia, where he became a lawyer. Full of restless energy, he joined in 1835 the movement for attaching Texas to the United States. He took part in the convention which in March, 1836, declared Texas independent of Mexico, and became its first secretary of war. He fought at San Jacinto and on him devolved Gen. Sam Houston's command, when the latter was wounded. After leading some expeditions against the Indians, Rusk was made chief-justice of the Supreme Court, but resigned in 1842. He presided in the convention which ratified the annexation of Texas to the United States and was then elected to the U. S. Senate.

Of this body he was a member for ten years, being also its president *pro tem.*, when he died by his own hand at Nacogdoches, Texas, July 29, 1856.

RUSKIN, JOHN, the most eminent English art critic, was born in London, Feb. 8, 1819. His father was a London wine-merchant, who accumulated an ample fortune, which John, his only son, inherited. The elder Ruskin was a man of considerable culture, with much love for and taste in art, which artistic sense early manifested itself in his son. He was in the habit of making commercial journeys throughout England, often taking his son with him, and in these excursions spent much time in seeking attractive scenery, studying fine architecture, and visiting notable collections of paintings, pointing out their excellencies, and doing his utmost to cultivate the intense love of nature and art which these teachings awakened in the boy. To the teaching of his mother, a strict Evangelical, Ruskin owed the strongly religious tendency of his mind, and also his love of literature, which she took every pains to develop. These careful instructions of his parents in art, literature, and morals went far to develop in early life his naturally artistic and devout inclinations, and laid the foundations of his later career. He remarks, concerning his early love of nature: "In such journeyings, whenever they brought me near hills, and in all mountain ground and scenery, I had a pleasure as early as I can remember, and continuing until I was eighteen or twenty, infinitely greater than any which has been since possible to me in anything. . . . Although there was no definite religious sentiment mingled with it, there was a continual perception of sanctity in the whole of nature, . . . an indefinable thrill such as we sometimes imagine to indicate the presence of a disembodied spirit." He spent much of his time in communion with nature, having no inclination for playmates, and describes, in a poem written at 9 years of age, the effect produced on him by a striking natural scene. His early literary inclination, indeed, was towards poetry, and he continued to write verses till his thirtieth year, but never excelled in this direction. His poems manifest fine imaginative and warmly sympathetic powers, but are deficient in the equally necessary qualities of form and expression.

In 1833 Ruskin entered college at Christ Church, Oxford, whence he graduated in 1842. While at Oxford he won the Newdigate prize (1839) by a poem entitled *Salsette and Elephanta*, describing the dawn of Christianity in Hindustan. During the same period he wrote, at the age of 16, some articles on geology, which were followed by a series of anonymous articles on "The Poetry of Architecture." His artistic studies while at college, in connection with his life-long study of nature, led him to the conception that art, as then cultivated in England, had been led aside from nature by blind dependence on classic models. To this was added the conception that the landscape paintings of Turner, which he had deeply studied, indicated the opening of a new and natural school of art; that this great painter had been treated with gross injustice by his contemporaries, and that he formed the proper model for the correction of the vitiated public taste. These views, adopted with impassioned earnestness, were to some extent incorrect. The powers of Turner had been appreciated by many, and for that purpose he cannot justly be said to have needed such a prophet as Ruskin. To defend his favorite painter against his critics the young enthusiast began a review article, which the native fluency of his pen quickly expanded to a volume. This was published in 1843 under the title, *Modern Painters: their Superiority in the Art of Landscape Painting to all the Ancient Masters.* By a Graduate of Oxford.

This anonymous work created an immediate and immense sensation in art circles, and among lovers of literature in general. While devoted largely to an ardent advocacy of the artistic merits of Turner's paintings, with a fervent espousal of the claims of this artist to

high consideration, it broadened out into a general criticism of modern art methods, and displayed a knowledge of the subject, and a deep study and intense appreciation of the beauties of nature, couched in a rich and flowing style, which could not fail to attract widespread attention. The work, indeed, did not become an authority with critics and connoisseurs, but its rhetorical brilliancy of style and eloquent descriptions gained it a host of admirers, while the summary manner in which it set aside the distinguished masters of the past in favor of Turner stirred the world of art to its depths. The hollowness of much that had been generally accepted was laid bare, and at one stroke it was made evident that a new departure must be made. As Wordsworth had inaugurated the era of naturalism in poetry, so Turner, under Ruskin's championship, was about to do so in art.

The publication of this initial volume was followed by several years of residence abroad, during which Ruskin devoted himself to the study of art in Italy, and especially in Venice, and greatly enlarged that wide knowledge of the subject which is manifest in all his writings. The first fruits of this extended study was a second volume of *Modern Painters*, entitled *Of the Imaginative and Theoretic Faculties*, in which he gives an elaborate critical survey of the works of the old masters, who are compared with the modern English landscape painters, much to the advantage of the latter. These volumes displayed acute analysis of the elements of truth in painting, with abundant examples drawn from ancient and modern art, that went far to cause a complete revolution in the creed of artists, and to send the devotees of the brush to nature for their inspiration. At intervals during the succeeding years three more volumes of *Modern Painters* appeared, the third being entitled *Of Many Things*; the fourth, *Of Mountain Beauty*; and the fifth, published in 1860, *Of Leaf Beauty, of Cloud Beauty, of Ideas of Relation*, etc. The author continued his study of the several elements of landscape art and his fervid championship of Turner, writing with a lucidity and brilliancy of style that went far to atone for many defects of his literary work.

During the publication of these volumes his art studies in Italy led to other works of great literary merit and artistic value. In 1849 appeared *The Seven Lamps of Architecture*, these lamps indicating the character that good architecture should possess, the spirit in which it should be produced, and the moral perfection it should illustrate. Then followed his eloquently written *Stones of Venice* (3 vols., 1851-53), which for poetical richness and vividness of expression forms one of the prose masterpieces of the century. In this, the era of development of Gothic architecture in Venice is upheld as that of domestic faith and national virtue; that of Renaissance architecture as a period of domestic corruption and national vice. Several minor works on art subjects appeared in this era of Ruskin's life, including a pamphlet on *Pre-Raphaelitism* (1851); a series of *Lectures on Architecture and Painting* (1853); *The Opening of the Crystal Palace and The Elements of Drawing* (1857), with a story for children, *The King of the Golden River*. Of these works, *The Elements of Drawing* is one of the most practically useful that has appeared from his pen, and while not altogether safe in its teachings is of the greatest value as a sketcher's companion.

Modern Painters has been characterized by an able writer as "undoubtedly the greatest critical treatise ever written on art," and to a degree on literature and nature. Ruskin is unquestionably at the head of English writers on art, despite his conceits and idiosyncracies, and his lack of philosophical generalization. No other English writer compares with him for extent of knowledge in this field of study, or for vividness and value of art criticism. The skill, erudition, zeal, honesty of purpose, and emotional earnestness displayed in his works are worthy of all praise, and though his

judgment is not infallible, his reputation as a critic has steadily increased, and his decision on an art subject is of the highest value. He declares that the laws of painting are as unerring as those of music and chemistry, and that any one who masters them has all that is necessary to make a capable critic. In his view a painter is great if by any means he has laid open noble truths or aroused noble emotions, and it matters not what he paints so that he paints honestly and truly, with love of virtue and hatred of vice; while the sum of all the qualities needed to the highest production in art is the sum of all the best powers of man.

Few writers have put their mental personality more fully into their works than Ruskin. Sympathetic and confidential, touched with egotism and responsive to every inward influence, it is impossible for him to stand outside his works, and his passing moods and changing convictions are expressed without thought of the contradictions which they frequently involve. For ease and beauty of style he has few equals in English prose literature, his sentences being stately in manner, richly ornate, musical, and eloquent, while an intensity of feeling and expression manifests itself in everything he writes. Yet in giving free vent to his emotional imagery he is heedless of logical consistency, so that there is much less of reasoning than of impassioned sentiment in his works. As a consequence there is great lack of system and of orderly unfolding of purpose, his matter often losing power by too many words, while his habit of putting down whatever enters his mind at the moment, however irrelevant, makes his books discursive and to some extent tiresome, despite all their charms of style. In the language of one of his reviewers his merits may be summed up in a few words. He is the critic, rather than the philosopher of art. He has the keenest sensibility to the influence of nature, observes with accuracy and at the same time with strong poetic feeling, few men being more alive to beauty or having studied its manifestations more diligently. His knowledge of the beauties of nature is applied to the study of works of art, and enables him to judge their comparative merits with rare taste and warm sympathy. As a judge he is positive and severe but enthusiastic, praising and blaming alike from the heart, yet apt to decree from momentary impulse instead of criticising from well-digested study, yielding to instinct rather than to reason in forming his judgments. Fortunately his instinct is usually apt to be correct, and his opinions as a rule defensible, but by no means always so, his works being full of extravagances both of thought and expression, and of opinions whose lack of cogency is covered up with grace of rhetoric. Despite his faults he is an active and fearless thinker, strong in his likes and dislikes, and an eloquent exponent of refined tastes and noble sentiments.

The Pre-Raphaelite school of art, developed by such British artists as Millais, Hollman, Hunt, and the Rossettis, about 1850, was largely instigated by Ruskin's early works, and aroused his deep interest. The title of this school is hardly a correct one. Its purpose was not to blindly copy the methods of the artists preceding Raphael, but like them to go to nature for inspiration, and escape that tyranny of the old masters which so long had prevailed. It was the inevitable revolt against the conventionalism of the schools and the spirit of naturalism, rather than of mediævalism, that instigated these artists as it had instigated Ruskin before them, though some degree of a new mannerism arose in both cases from the too close study of mediæval art. Yet the revival of interest in Gothic art, so strongly helped forward by Ruskin, was the necessary step of escape from the prevailing classic conventionalism, and of progress into that devotion to nature as the only true basis of art which has grown and is still growing therefrom. Ruskin is the prophet of this new dispensation in art, and has been undaunted in teaching and developing it.

Only a portion of Ruskin's contributions to art

study have here been mentioned. Other works and pamphlets on the subject, both before and after 1860, flowed from his pen, besides many review articles, while his numerous lectures have also been collected into book form. He gave a course of lectures on Gothic art at Edinburgh in 1853, was appointed professor at the Cambridge school of art in 1858, Rede lecturer at Cambridge in 1867, and held the Slade professorship of Fine Arts at Oxford from 1869 to 1879; in 1883 he was re-elected to the last-named professorship, but resigned in 1885 in consequence of the introduction of vivisection into the Oxford schools. In addition to his writings on art, Ruskin practised drawing and painting, and illustrated several of his own books, such as *Stones of Venice*, but as a painter displayed no special merit.

The new phase of Ruskin's life, which began in 1860, has subjected him to severe criticism, while his enthusiasm has not been tempered with worldly wisdom. Turning from the study of art to that of society, he came forward as a reformer in social science and political economy, and has since worked in this field with all the force and earnestness of his older labors in art, but with less of knowledge and judgment. His writings in this direction began with a series of articles on "Political Economy," contributed to the *Cornhill Magazine* in 1860. These have been followed by numerous works, many of them with fantastic titles, on the same general subject. Of these may be named *Sesame and Lilies* (1864); *The Ethics of the Dust* (1865); *The Crown of Wild Olive: Three Lectures on Work, Traffic, and War* (1866); *The Queen of the Air: Being a Study of the Greek Myths of Cloud and Storm* (1869); *Frondees Agrates* (1875); *Fiction Fair and Foul* (1881); and *Arrows of the Chace* (1883). Magazine articles on political economy have since been published under the titles *Unto this Last*, and *Munera Fulveris*, while two lectures on the "Political Economy of Art" have been published as *A Joy for Ever*. Ruskin began in 1871 a series of monthly letters to workmen, under the title of *Fors Clavigera*, with the declared purpose of establishing a fund to rescue British workmen from the tyranny of machinery. This series of letters continued till 1884. The most interesting of his later publications is his frank and garrulous autobiography, *Præterita* (2 vols., 1886-87).

It must be said that Ruskin's labors in behalf of workmen has called forth no ardent response from the class they were intended to benefit, and that his crusade against machinery and desire to bring back the happy days of hand-work has met with contumely rather than assistance from the world of industry. The fact is that Ruskin's principles of political economy, while containing much that is wise and sensible, contain much also that is impractical and chimerical, while the new ideas which he has sought to instil into the minds of workmen have roused fierce opposition among employers, who look upon him as a dangerous radical, seeking to break down the existing industrial relations. His contributions on political economy to the *Cornhill Magazine*, indeed, raised such a fierce outcry that the editor was compelled to refuse their further publication. *Fraser's Magazine* then accepted them, but was likewise compelled to cease publishing them.

Ruskin, finding that his published utterances were not having the effect upon the political and industrial world that he desired, attempted next to put his own theories in practice, and demonstrate to the world that his views were well founded and capable of practical realization. He built a number of model houses for the poor in London, and in 1871 established St. George's Guild, an industrial society of which he became grand master. Its purpose was to reclaim a tract of waste land on which his views of labor might be realized, develop education and culture among agriculturists, and help the industrial poor to better their lot in life. The ordinary relations of capitalist and laborer, master and tenant, were here discarded, and

the views adopted were those in vogue in Florence in the fourteenth century, with some necessary modifications. They were largely communistic, and took in charge the health and education of the people, with special arrangements of supply and demand, accumulation and distribution of wealth. It is presumable that the laws and industrial conditions of St. George's Guild are those which Ruskin believes should be applied to the whole nation. If they were adopted every man, woman, and child would be a ward of the state, trained and compelled to move in the lines for which nature and education fitted them; food and clothing would be dispensed by state agents and sold at an established price; communistic relations would exist among the people; the mode of building houses and cities would be prescribed, and no city permitted to contain more than 25,000 persons; and co-operation of all for the good of each would be the ruling principle of society. In addition a fixed creed of religious, social, and political duties would be taught and enforced, in which all laws and orders of the monarch must be obeyed except such as appeared inconsistent with what each subject in his own conscience supposed to be the law of God.

There is much more of the same chimerical and impracticable tenor in Ruskin's theory of society, and though his purposes were instigated by a nobly unselfish desire for the good of man, his schemes have necessarily proved failures. They were based on an ignorance of human nature and a disdain of the practically established laws of society, and while in some of their conditions seeking to lead man forward centuries into the future, in others they sought to take him back centuries into the past. In his treatises on political economy Ruskin, in fact, writes as a moralist, not as a scientist, and is guided by feeling, not by reason. He cares little about the established laws of the science of society, but much for men and women, attacks existing conditions blindly, and proposes an order of society which it would be impossible to establish. He attacks, for instance, the principle of usury, and declares that loans should be simply repaid, to demand interest being in his view to take an unjust and immoral advantage of the borrower. He would have luxury and the possession of great riches forbidden by the state, and is particularly opposed to the prevailing theory of demand and supply, claiming that human duties and sympathies make such a law void. Man is in his view more than a figure in a sum, and he permits sentiment to set aside the principles of natural law. He abhors democracy, and follows Carlyle in his belief of the saving efficacy of a strong government. He wants a strong man to rule, and the masses to be taken care of by a paternal government, believing that the ballot in their hands is worse than misapplied, and is the cause of many of the evils that have come upon the working class. As one of his reviewers says, "he is trying with Mrs. Partington's broom to sweep back the ocean." Feudalism and absolutism are of the past, and the world has moved and is moving far beyond them to better and higher conditions. Ruskin sees the gorgeous show and knightly pretence of feudalism, not its baseness and corruption. He looks with the eyes of the poet only, not with those of the historical scientist, and sentiment in him is far more dominant than reason. The conditions of the modern world therefore meet with his strong disapproval; those of the past with his strong approbation. He finds serious fault with the railway system for its defacement of the scenery of England, and with the factory system for the blurring and blasting effects of its smoke. For similar reasons all modern industrial improvements meet with his reprobation, and the preservation of scenic effects and artistic conditions holds an important place in his ideas of political economy. In a like spirit he objects to go to America because it has no castles, and demands that there should be a special dress for each class in society. Ruskin's mental charac-

teristic of poetical sensibility and emotional enthusiasm, in fact, while consonant with success in art criticism, unfits him decidedly for scientific investigations, and in his social studies he has only perceived that something is wrong with the world, while quite incapable of reasoning out the true causes and proper cure for the malady.

Opposition and failure have made him petulant and querulous, and he has lost much of his influence by his fault-finding and spirit of contempt for what displeases him. He has grown, indeed, wrong-headed and wilful in little things, has criticised painters in such a spirit as to be brought into court to answer, and in many directions he has departed from reasonable moderation. In art he carries his zeal as a critic too far, makes the moral aim unduly prominent, and insists too strongly that only an artist of pure character and conduct can accomplish a great work. He is similarly too uncompromising a realist, and finds strong fault with external details, such as Raphael's clothing his apostles in the dress of Greek philosophers, unmindful of the fact that if they are made apostles in face and mien the dress is of minor consequence.

These are faults, yet they detract little from Ruskin's merits as an art critic. In spirit he is intensely and sincerely religious. The natural world is to him the divine world, and he loves nature not for its beauty alone, but as the tabernacle of the Divine Spirit. He is always true to his highest conceptions, always at war with the evils of a materialistic and money-loving age, and in all he writes a deep appreciation of the innate goodness and beauty of man and nature appears. Though he may not be a safe critic in the technical points of art, he is genuinely so in its underlying spirit, having a breadth of vision, a range of sympathy, and a just conception of truth in art which have enabled him to overthrow conventionalism and bring art back to nature for its inspiration.

In literature Ruskin has been much too diffuse for the reputation of his works. He has written so profusely that few have the time to follow him. His books need sifting, and few of them will live. Though his later works contain many of his best and maturer thoughts he will be probably known to the future by *Modern Painters*, *Stones of Venice*, and *The Seven Lumps of Architecture* alone. Yet he has had and will have an influence on thought not to be measured by the number of his readers, and like all great thinkers has done much to mould the thoughts of his generation and of those to follow.

For more than half a century Ruskin resided on the Herne Hill and Denmark Hill estates of his father. In 1875 he bought an estate at Brantwood, on Coniston Lake, on which he has since chiefly resided. His father left him the large fortune of \$785,000, of which he has but \$50,000 or \$60,000 left. Immediately on his father's death he distributed \$35,000 among relatives whom he deemed his father had overlooked, and the remainder of his vanished fortune has been spent in various plans for ameliorating the condition of the poor. As a man and an author he has lived up to his ideas, and well deserves even more than the appreciative remark from Charlotte Brontë: "Mr. Ruskin appears to me one of the few genuine writers, as distinguished from book-makers, of this age." (C. M.)

RUSSELL, WILLIAM HOWARD, war-correspondent, was born at Lily Vale, near Dublin, Ireland, May 28, 1821. He was educated at Trinity College, Dublin, and became a lawyer at London. He had already done good work for the *London Times*, and in 1854 was sent to report the condition of the British army in the Crimean war. He was the first war-correspondent and received little favor from the military authorities. His faithful exposures of the short-comings in the commissary and hospital departments produced a sensation in England, and led to important changes in their administration. Afterwards his graphic sketches of the battles and incidents of the long siege of Sebas-

topol established his fame in the field. He went to India during the Sepoy mutiny, and came to America in 1860 when secession was imminent. He travelled through the Southern States and reported fully their spirit and preparations for war. Taking up his residence in Washington he noted the outburst of Northern sentiment in behalf of the Union, and the formation of the Army of the Potomac. After Gen. McDowell had advanced to the field of Bull Run, Russell set out from Washington to join the army, but was overwhelmed with the dense mass of soldiers and civilians in full retreat. Instead of reporting the battle he reported the rout so graphically that when his published letter reached the United States he was dubbed "Bull Run Russell." He continued to report the movements of the war as he saw them at Washington, and was for a time with Gen. McClellan in camp. But as his reports seemed to give aid and comfort to the enemy, Secretary Stanton refused him permission to accompany McClellan in the Peninsular campaign and he returned to England. He was again employed in reporting the war between Austria and Prussia in 1866 and gave an excellent account of the battle of Sadowa. The German invasion of France in 1870, the visit of the Prince of Wales to India in 1875, the Russo-Turkish war of 1877, and the Berlin Conference of 1880 also employed his pen. He founded in 1858 the *Army and Navy Gazette*. His books are chiefly collections from his correspondence. They include *History of the Crimean War* (2 vols., 1857); *My Diary in India* (1860); *My Diary North and South* (1862); *Canada, its Defences, Condition and Resources* (1865); *My Diary in the East* (1869); *My Diary during the Last Great War* (1873), and *Hesperother: Notes from the West* (1882). He has also written a novel and some minor works.

RUSTOW, WILHELM, German military writer, was born in Brandenburg, May 25, 1821. Having entered the army in 1838 he rose to be an officer of engineers. In 1850 he was indicted for publishing a work on the military condition of Germany and fled to Zurich. He was made a major in the Swiss army and in 1860 he took part in Garibaldi's expedition to Sicily. He translated the Greek military writers and was associated with Köchly in his history of Greek military art. He also discussed the campaigns of Caesar and Napoleon, the Crimean and the Franco-German war of 1870. He published many technical works on military art of recent years, including a *Military Dictionary* (2 vols., 1859). His brothers, Alexander and Caesar, also wrote military works of value.

RUTGERS COLLEGE. The establishment of this institution, originally called Queen's College, has been usually dated from a royal charter of 1770. Recent investigation, however, shows that "his Majesty's Letters patent and Charter or Royal grant" for Queen's College was secured from his excellency William Franklin, Esq., governor and commander-in-chief in and over the Province of New Jersey, on Nov. 10, 1766." Owing to certain injurious discriminations between the trustees residing in New Jersey and those in New York, authorized in this first charter, a second one was obtained in 1770; and the college went into actual operation at New Brunswick in 1771. It was the outgrowth of a desire on the part of its Dutch founders to perpetuate their distinctive theology and forms of worship, and was for many years under the patronage of the General Synod of the Reformed Protestant Dutch Church of America. Its object was to aid in preparing young men "for the ministry and other good offices."

During the Revolutionary struggle the British took possession of New Brunswick, burned the college building, and scattered the teachers and students. After a migratory existence, now at Millstone and now at North Branch, with a commencement held in 1788 at New Brunswick, the college was closed for a period of six years. Rev. Dr. J. R. Hardenburgh, who had from the beginning labored with indefatigable zeal to

secure subscriptions, became its first regular president in 1785, and continued in office until 1790. William Linn, D. D., an impassioned preacher in the Collegiate Dutch church, of New York city, assumed the presidency pro tempore from 1791 to 1794. Owing to financial embarrassments the exercises of the college were suspended from 1795 to 1805. At the latter date Rev. Dr. Ira Condict, who acted as pro-tempore president from 1794 to 1810, was instrumental in reviving the college and in securing the erection of the noble brown stone edifice now standing in the centre of the campus. John H. Livingston, D. D., a man of noble character, accurate learning, and commanding influence, was the second regular president, from 1810 to 1825. He was, however, mainly interested in the theological professorship which he held in connection with the presidency; so that he did little more in the college than "to preside on public occasions and sign diplomas." Financial distress and divided counsels led to a third suspension of literary exercises from 1816 to 1825. Philip Milledoler, D. D., LL. D., now became president, and the name of Queen's was changed to Rutgers College "in consideration of the character and services of Col. Henry Rutgers," a revolutionary patriot who contributed towards its endowment \$5000, at that time considered a large amount. Dr. Milledoler was distinguished for his fervent piety, catholic sympathies, and above all for his unction in prayer that seemed akin to inspiration. The number of professors was increased, and the endowment enlarged to \$50,000. The kind of work done by the college during this period may be judged from the fact that in the class of 1836 occur the names of Joseph P. Bradley, LL. D., Associate Justice of the U. S. Supreme Court; George W. Coakley, LL. D., professor of mathematics in the New York University; Frederick T. Frelinghuysen, U. S. Senator, and Secretary of State; William A. Newell, M. D., member of Congress and Governor of New Jersey and Washington Territory; and Hon. Cortlandt Parker, LL. D., an eminent and successful lawyer.

From 1840 to 1850 the presidency was filled by Hon. Abraham B. Hasbrouck, whose lectures on Constitutional Law, genial manners, and generous hospitality contributed greatly to the prosperity of the college. A residence for the president was erected on the campus, and also a little later Van Neste Hall for the use of the literary societies and recitation-rooms. The latter structure was so named in honor of Abraham Van Neste, a liberal trustee. At the same time additions were made to the permanent fund.

Hon. Theodore Frelinghuysen succeeded to the office of president in 1850. He was a man of unusual wisdom and guilelessness; his disposition was naturally gentle and always pervaded by a thorough Christian spirit; his manners were conciliatory and his intellect was as discerning as his heart was upright. His influence, therefore, in settling a controversy that had been bitterly waged as to the relations of the trustees to the Synod of the Reformed Church was of the happiest nature. The feeling of loyalty to the institution extended through the entire denomination; students increased, and many \$500 scholarships were disposed of, making the endowment \$75,000. A year before Mr. Frelinghuysen's death the civil war broke out, causing a great decrease by enlistments and other distractions in the number of students; and at the same time as the income did not meet the salaries of the professors and the current expenses the principal of the endowment began to be seriously diminished.

With the accession of Rev. Wm. H. Campbell, D. D., LL. D., to the presidency in 1863, the college took a new departure in prosperity. By the payment of \$12,000 to the Synod of the Reformed Church the college regained its title to the campus and buildings, and became an independent literary institution on the condition that henceforth its president and three-fourths of the trustees should be members in full communion of the Reformed Church. Dr. Campbell

with an energy that overleaped all obstacles presented the claims of the college in the pulpits of the denomination and to individuals until he raised the sum of \$144,758; and on the occasion of the centennial celebration he made another great effort which resulted in subscriptions amounting to \$140,000. During his administration six new professorships were established, the number of students doubled, reaching at one time 200, and the following buildings erected: a large geological hall, an exceptionally beautiful chapel and library under one roof, an astronomical observatory, an addition to the grammar school more than doubling its accommodations, and certain useful structures on the experimental farm. These works tell their own story of diligent wisdom and render a well-earned fame secure. When Dr. Campbell resigned the trustees generously gave him an annuity of \$3000 for life.

The State College of New Jersey "for the benefit of Agriculture and the Mechanic Arts" was organized as a department of Rutgers College in 1865. It originated in a provision of Congress granting to the several States a certain quantity of the public lands to enable them to establish colleges, the leading object of which shall be to "teach such branches of learning as are related to agriculture and the mechanic arts, in such a manner as the Legislatures of the States may respectively prescribe, in order to promote the liberal and practical education of the industrial classes in the several pursuits and professions of life." The sale of the public lands allotted to New Jersey amounted to \$116,000, now invested in State bonds under the care of the State treasurer, and the income of which is paid to the trustees. Great credit is due to Dr. George H. Cook, the vice-president of the college, and who for many years had rendered invaluable services to the State, as the State geologist, for his energy and influence in securing the location of the State College at New Brunswick as a part of the scientific school of Rutgers already in existence. A farm of 100 acres is used with great success for conducting experiments in agriculture, the results of which are published for the benefit of farmers. Fifteen professorships ably manned afford instruction in four courses of study, viz.: one in engineering and mechanics, one in chemistry and agriculture, one in electricity, and one of two years in agriculture. The courses of study and discipline are under the management of the faculty and trustees of Rutgers, subject to the supervision of a board of visitors appointed by the governor, and consisting of two from each Congressional district. It provides fifty free scholarships, which are distributed among the counties according to population.

In June, 1882, Merrill Edwards Gates, Ph. D., LL. D., L. H. D., was inaugurated president of Rutgers College. Dr. Gates took this position with the prestige of unusual success as an educator while principal of Albany Academy. Since his accession the endowment has been still further increased by \$115,000 besides annual subscriptions pledged for a period of years amounting in all to over \$30,000, making the total income of the college about \$50,000; the library has received 14,000 additional volumes; the standard of scholarship has been raised both by new requirements for admission, and by a rigid insistence upon faithfulness in study and the maintenance of a high moral character as necessary to graduation; certain subjects in science treated in German and French textbooks have been introduced; physical development by appropriate gymnastic exercises have been made compulsory; the classical department has been reorganized and improved; new emphasis and impulse have been given to the pursuit of modern languages; several new professorships have been created, affording wider instruction in scientific subjects, such as electrical engineering, biology, mineralogy, etc.; more laboratory work with greater facilities of room and teaching has

been assigned to special students; and the number of students has grown from 116 to 193. In addition to his fruitful college labors Dr. Gates takes much interest in public affairs both as a speaker and a worker.

By act of Congress in 1887 an annual appropriation of \$15,000 was authorized for the agricultural colleges of each State, to be expended in carrying on and publishing investigations in the interests of agriculture; and by an act of the New Jersey Legislature in 1888 the sum of \$30,000 was appropriated for a laboratory for the agricultural experiment station located on the college grounds. The services of Dr. George H. Cook, who has always been devoted to the agricultural and industrial interests of the State, deserve in connection with these two acts the heartiest recognition. Rutgers College has a faculty of eighteen professors, but not a tutor, affording instruction in all subjects taught in other best American colleges. Its students, besides having their own society libraries and the college library at command, enjoy full privileges in the Sage Library belonging to the theological seminary, making altogether over 70,000 carefully selected volumes open for their consultation.

The trustees of the college have also an excellent grammar school fully equipped with teachers and a boarding department where sanitary arrangements receive special attention. (T. S. D.)

RUTH, BOOK OF. The article on this subject in the *ENCYCLOPÆDIA BRITANNICA* is See Vol. XXI. mainly an argument to prove that "the p. 110 (p. 119 Book of Ruth does not offer itself as a document written soon after the period to which it refers," but was written at some unknown date, "long after the time of Ezra." In proof of this it is argued that Jewish tradition classifies Ruth, not among the prophetic writings, but among the Hagiographa as one of the Megilloth. But if this were fully admitted it would not prove that the tradition regarded Ruth as either late or non-prophetic in its origin; for the Jewish tradition attributes the larger part of the Psalms to David, Canticles and most of the Proverbs to Solomon, certain other Hagiographic writings to the times of Hezekiah, and, indeed, regards most of the Hagiographa as pre-exilic, and all of them as of prophetic authorship. The notion that the Hagiographa are mostly a collection of writings that were produced too late to be included in the legal and prophetic canons is wholly untenable. (See *BIBLE* and *CANON*.)

But the statement that Jewish tradition classifies Ruth among the Hagiographa, while partly true, does not convey the whole truth in the case. "The Septuagint, the Vulgate, and the English version make Ruth follow Judges." As a mere matter of classification, Ruth fits very well either of the two positions assigned to it. Which position is the correct one depends on the principle of classification followed. But there is no room for reasonable doubt that the arrangement that connects Ruth with Judges is the one which really represents the Jewish tradition as to the date and authorship of the book. The average reader would probably understand from the article in the *BRITANNICA* that the evidence of this is solely conjectural—that it depends upon the fact that by counting Ruth with Judges and Lamentations with Jeremiah the 24 books of the Hebrew canon "can be reduced to 22, the number assigned by Josephus and other ancient authorities." But this understanding of the matter is a mistake. The opinion that Ruth was counted with Judges and Lamentations with Jeremiah is not a mere conjectural way of accounting for the phenomena, but is supported by explicit testimony. Jerome specifically testifies to it, and evidently regards it as the preferable view, though he mentions the other classification of the books as being held by some. Origen directly and unequivocally says that the Hebrews counted Judges and Ruth as one book, and he recognizes no other view. The *Baba Batra*

informs us that Samuel is the responsible author of Ruth, as well as of Judges, and the books of Samuel. Josephus not only counts the books as 22, but he uses the Book of Ruth as a source of the history, in precisely the place where it stands in the versions, *Ant. V. ix.*

In opposition to this it is said: "It has been shown in the article on LAMENTATIONS that the argument for the superior antiquity of this way of reckoning breaks down on closer examination." But the only proof offered in the article referred to for the purpose of breaking down "this way of reckoning" is the fact that Origen also ascribes "the epistle" to Jeremiah. It is alleged that, by this indefinite term "the epistle," Origen probably meant a certain book that Jeremiah surely did not write, and that Origen's testimony is, therefore, not to be credited. But as this touches only the testimony of Origen, and not that of the other witnesses, and as no one would hesitate to believe Origen in the main, even if he is incorrect in a specification here and there, the attempt to "break down" the evidence is not a success. It is certain that all ancient tradition concerning the Book of Ruth connects that book with Judges and Samuel.

But several critical reasons are urged against accepting this tradition. It is said, for instance: "While it was very natural that a later rearrangement should transfer Ruth from the Hagiographa to the historical books, . . . no motive can be suggested for the opposite change." On the contrary, the character of the book, and the use made of it in the reading lessons, might very naturally suggest the placing of it among the Megilloth, with the other short books somewhat similar to it in character and use.

It is further alleged that the Book of Ruth shows no traces of "prophetic" or "Deuteronomistic" editing, and "has no affinity with the point of view which looks on the whole history of Israel as a series of examples of Divine justice and mercy in the successive rebellions and repentances of the people of God." Hence it is inferred that the book cannot have been known "at the time when the history from Judges to Kings was edited." These assertions need modifying; but so far as they are true of Ruth they are equally true of each of the five stories (Jud. xiii. 2-xvi.; xvii.-xviii.; xix.-xxi.; 1 Sam. i. 1-iv. 10; ix. 1-x. 16) that are grouped with Ruth in this arrangement of the historical books. The reason is evident in regard to them all. These stories are a different sort of literature from the narratives of public history with which they are connected. In them the interest lies chiefly, not in the facts of public history which they contain, but in the personal experiences of their heroes and heroines. This accounts for the relative infrequency of that class of authors' comments which would refer to the whole nation, rather than to the persons whose experiences are being sketched.

The statement that "the very designation of a period of Hebrew history as 'the days of the judges' . . . does not occur till after the exile," and the inference from it that Ruth i. 1 is post-exilic are alike incorrect. Neither this phrase nor any phrase fairly equivalent to it occurs in the post-exilic Hebrew of the Bible, save in 1 Chron. xvii. 10, where it is in a passage repeated from 2 Samuel. The phrase occurs substantially in the account given of King Josiah, 2 Ki. xxiii. 22, and the same idea is found in 2 Sam. vii. 11, and less sharply in many places in Judges and Samuel. The idea that by using the phrase the Book of Ruth "presents itself as dealing with times far back" is uncritical; the phrase would be appropriate at any time after the monarchy had been a few years in existence. It is an overstatement to say that the book "takes obvious delight in depicting details of antique life and obsolete usages." There is nothing to show that the writer thought of these details as either antique or obsolete. From the Biblical accounts it appears that David's conquests led to a sudden and considerable

change in the civilization of Israel—a change which exhibited itself in architecture, music, literature, and luxury of living, as well as in the revival of prophecy and of the ancient Mosaicism. Especially when we have this fact in mind we see that all the details of old usages in the Book of Ruth are such as might naturally have been put on record by a writer who lived not later than the last years of David.

It is said that the author of Ruth views the period in which his story is laid "through the softening atmosphere of time, which imparts to the scene a gentle sweetness very different from the harsher colors of the old narratives of the Book of Judges." But in the nature of things there must have been peaceful, pastoral events in the times of the judges, as well as events of war and violence; and a skillful writer would picture each in the colors that properly belong to it. The circumstances that compelled Elimelech and his sons to live and die in exile have no "gentle sweetness" in them. Whatever difference there is in this respect between Ruth and the other stories of the times of the judges can be accounted for by the differences in the subject-matter. There is no need to suppose a long interval of time between the event and the author in order to account for them.

In fine all the external evidence goes to show that Ruth belongs to the group of writings, concerning which the *Baba Batra* testifies that Samuel the prophet wrote them, but that Gad and Nathan finished them. To this group belong also the Books of Samuel and Judges. These books, taken together, form a quite peculiar historical work, largely made by the process of putting together previously written parts, which is, in literary character, as distinct from the Books of Kings as it is from the Hexateuch. The tradition that Samuel wrote it is certainly capable of being understood in a sense in which it would be evidently untrue, but it is also capable of being so understood as to be consistent with probability. (See JUDGES, KINGS, and especially SAMUEL.) According to this evidence, therefore, Ruth was written within the lifetime of these three prophets, probably in the reign of David.

All the phenomena that appear in the book are consistent with this view. It would be difficult to establish by instances the statement that the language of the book is "post-classical." And in regard to its contents, Ruth, like Jud. xvii., xviii., xix.-xxi., etc., is a story of Bethlehem Ephrata, the home of David. It alludes to events up to the time when David reigned, and no later. It is written in the interests of monarchy, showing that the pre-monarchical times were often times of calamity even for good citizens. The motives for writing just such a work never would be stronger than they were in David's lifetime.

Similar considerations show that the book is to be regarded as historical, and not as a mere romance, however fit a romance like this might be to form a part of the Scriptures. Josephus certainly counted it historical, *Ant. V. ix.* So does the Book of 1 Chronicles in its genealogical lists, and so does the evangelist Matthew, Matt. i. 5. The historical character of the events also connects itself with the fact that David took his parents to sojourn in Moab, 1 Sam. xxii. 3, and with his acknowledgment of obligation to the Ammonite king, 2 Sam. x. 2.

The idea that the genealogical statement with which Ruth closes was borrowed from Chronicles, and added to Ruth by a later hand, is contrary to all the analogies of the relations of Chronicles with the other books, and is not sustained by the facts cited to prove it. It is, of course, true that the author of Ruth, iv. 5, 10, "clearly recognizes that Obed was legally the son of Mahlon," but it does not follow that he was not also the son of Boaz, nor that "from this standpoint the appended genealogy is all wrong." If Boaz had no nearer and preferred heirs of his own blood (and this seems to be the implication of the whole account),

then Obed was by the law his son as well as Mahlon's son, and the genealogy is consistent with the rest of the story.

Literature.—Good commentaries on Ruth are those of Dr. P. Cassel, translated by Dr. P. H. Steenstra, in the *Schaff-Lange* series, and of Dr. James Morison in the *Pulpit Commentary* series. (W. J. B.)

RUTLAND, a city of Vermont, county-seat of Rutland co., is at the junction of the Otter and East Creeks, at the foot of the loftiest peaks of the Green Mountains, Killington and Shrewsbury. It is 67 miles from Burlington and 84 miles north of Albany. Three railroads enter the town and have their repair-shops here. Rutland contains a U. S. court-house, the State work-house, 7 hotels, 4 national banks, 4 other banks, 2 daily and 3 weekly newspapers, 7 churches, 7 schools. The most important industry is the quarrying and working of marble, for which there are 4 mills and 7 finishing-works in Rutland besides those in West Rutland. There are also 3 foundries and railroad car-shops. Rutland was settled in 1770, and during the Revolutionary war, being on the frontier towards Canada, was protected by two forts. It was one of the capitals of Vermont from 1784 to 1804, and the State-house then erected is still standing. It was incorporated in 1847, and in 1887 the "towns" of Procter and West Rutland were formed out of part of the original "town" of Rutland. The village is lighted with gas and has water-works and a park. Its property is valued at nearly \$10,000,000. The population of the village in 1880 was 7502 and of the "town" 12,149.

RUTLEDGE, EDWARD (1749-1800), signer of the Declaration of Independence, was born at Charleston, S. C., Nov. 23, 1749, being a son of Dr. John Rutledge, who had emigrated from Ireland about 1735. He studied law with his brother John, and afterwards at the Temple in London. On his return he was chosen to the First Continental Congress, and in 1776 he was appointed a member of the Board of War. When the British began hostile operations in South Carolina Rutledge took command of a company of artillery. In 1780 he was captured at Charleston and remained a prisoner at St. Augustine for a year. After the evacuation of Charleston, in 1782, he returned home and served in the Legislature. He drew up the act abolishing primogeniture and advocated the adoption of the Federal Constitution. In 1798 he was elected governor of his State. He died Jan. 23, 1800.

His elder brother, **HUGH RUTLEDGE** (1741-1811), was judge of admiralty, member of the Legislature, and from 1791 till his death chancellor of South Carolina.

RUTLEDGE, JOHN (1739-1800), chief-justice of the United States, brother of the preceding, was born in Charleston, studied law at the Temple, London, and began practice in Charleston in 1761. His devotion to liberty is attested by his being a leading member of the Stamp-Act Congress in New York in 1765, and of the First Continental Congress at Philadelphia in 1774. In the latter he was pronounced by Patrick Henry the ablest orator. He was chairman of the committee which prepared the State constitution for South Carolina and became its first governor. By his orders Fort Moultrie was supplied with ammunition against the British attack in 1776. Though he had resigned in 1778, he was recalled to power the next year when the British invaded the State. When Charleston fell he retired to North Carolina, yet exerted himself to keep up the spirit of opposition and to aid the Southern army. In 1782 he was sent again to Congress, and

in 1784 was made State chancellor. He took a prominent part in the convention which framed the Federal Constitution, and in the State Convention which ratified it. In 1789 Washington appointed him an associate justice of the U. S. Supreme Court, but he resigned this position when elected chief-justice of South Carolina. Washington showed his high regard for his ability by appointing him chief-justice of the United States in July, 1795, and as such Rutledge presided at the next term. But on account of his action in the agitation concerning Jay's treaty with England, the Senate in December would not confirm his appointment. It soon became known, also, that his mind was impaired by disease. He died July 23, 1800.

RYAN, ABRAM JOSEPH (1839-1886), poet, was born at Norfolk, Va., Aug. 15, 1839. He was educated for the priesthood in the Roman Catholic Church, and after his ordination was a chaplain in the Confederate army. To the cause which that army represented he was passionately devoted, and when it was lost his lyric, *The Conquered Banner*, found an echo in the hearts of thousands in the South, while it elicited a response from Lord Houghton in England. Father Ryan went to New Orleans in 1865, and there, besides clerical duty, edited a religious paper. Afterwards he removed to Knoxville, to Augusta, Ga., and to Mobile, where he had charge of a church for some years. In 1880 at Baltimore he published a volume of his *Poems, Patriotic, Religious and Miscellaneous*, which had already separately had wide circulation. Thereafter he wandered restlessly from place to place in the South, sometimes lecturing and at intervals writing a *Life of Christ*, which was left incomplete at his death. He died at Louisville, Ky., April 22, 1886.

RYDBERG, ABRAHAM VICTOR, Swedish author, was born at Jönköping, Smaland, Sweden, Dec. 18, 1829. He graduated at the University of Lund in 1852, and became literary editor of a daily paper at Gothenburg in 1855. He published numerous romances which have been translated into English, and also various works relating to the Bible, in which he shows extreme rationalistic views. In 1870 he was elected to the Swedish Parliament from Gothenburg. In 1884 he was made professor in the high-school at Stockholm. Among his romances are *Freebooter of the Baltic* (1857); *The Last Athenian* (1859); *Adventures of Little Vigg* (1874); *Roman Legends* (1874). Among his other books are *Doctrine of the Bible on Christ* (1862); *Jehovah Worship among the Hebrews* (1864); *Pre-existence of Man* (1868); *Eschatology* (1880). He has also translated Goethe's *Faust* into Swedish and published *Poems* (1882) and investigations in *German Mythology* (1886).

RYLE, JOHN CHARLES, English bishop, was born near Macclesfield in 1816. His father was a member of Parliament and he was educated at Eton and Christ Church, Oxford, graduating in 1836 with honor. He was ordained in 1841, and became curate of Exbury, then rector of Helmingham in 1844, and vicar of Stradbroke in 1861. Although these obscure places seemed little fitted to give him reputation he soon became widely known as the writer of pithy, forcible tracts of unmistakable evangelical sentiment. In 1869 he was made rural dean of Hoxie, and in 1880 Lord Beaconsfield called him to be bishop of the newly founded diocese of Liverpool. He is an extreme Low Churchman. Besides his tracts, which have circulated by thousands, he has published *Expository Thoughts on the Gospels* (6 vols., 1856-59); *Plain Speaking* (1861); *Christian Leaders a Hundred Years Ago* (1865); *Bishops and Clergy of Other Days* (1869); *Church Reform-Papers* (1870).

S.

SABATIER, LOUIS AUGUSTE, a French Protestant theologian, was born at Vallon, Oct. 22, 1839. He studied theology at Montauban, and thereafter visited several German universities. In 1868 he was made professor of French literature in the normal school at Strasburg, and lectured there in the Protestant theological faculty. In 1873 he removed to Paris, and became professor in the newly-erected Protestant faculty. His writings include *Le Témoignage de Jésus-Christ sur sa personne* (1863); *Les Sources de la vie de Jésus* (1866); *L'Apôtre Paul* (1870); *Guillaume le Tuoiturne* (1872); *De l'Influence des Femmes sur la Littérature française* (1873); *La notion hébraïque de l'esprit* (1879); *De l'origine du péché dans la théologie de l'apôtre Paul* (1887).

SABBATH is the name in common of sundry periodic times of rest ordained in the Mosaic economy. A Sabbath of the land was appointed for every seventh year, when fields were not to be sown nor vineyards pruned (Lev. xxv. 4). The yearly Day of Atonement, the yearly Feast of Trumpets, the first and the eighth days of the yearly Feast of Tabernacles were severally distinguished as Sabbaths (Lev. xxiii. 24, 32, 39).

But the name most frequently indicated the weekly rest of the seventh day, which had been earliest appointed, and by God himself, in commemoration of his own resting from the work of creation (Gen. ii. 3); and to this weekly rest-day of the Mosaic Scriptures the name "The Sabbath" is, in ordinary usage, applied. The name covers literally only the idea of rest. But the usage, as defined in the Mosaic law, included also the practice of religious duty, "Remember the Sabbath day to keep it holy" (Ex. xx. 8); and particularly of the great duty of public worship, "The seventh day is the Sabbath of rest, a holy convocation" (Lev. xxiii. 3).

This Biblical institution of a weekly religious rest-day has awakened immense interest and voluminous discussion, in regard to its origin, its ancient design, its history down to the time of Christ, and its standing with Him and His apostles. Yet its chief interest lies in a fact so important and so manifest that it supersedes all discussion; namely, that the observance of a weekly day of rest and religion has developed into one of the foremost factors of human welfare. Only the family and civil government are more conspicuously distinctive of Christian civilization. The ways in which this notable observance contributes to the advantage of individuals, of families, of communities, and of nations have been the subject of clear statement, and often of very extensive exposition, by a multitude of writers as diverse in their views concerning the divine claims of the usage as Luther, Hooker, Grotius, Paley, Thomas Arnold, Domville, Hesse, Dr. Norman McLeod, and P. J. Proudhon, socialist and atheist. But far more formal attestation of the fundamental importance of the usage has been given by that long array of the acts of legislatures and courts, especially in Great Britain and America, which is noticed below.

It is in these two unquestionable relations of the weekly rest-day, namely, to the Mosaic Scriptures on the one hand, and to the fundamental and enduring interests of mankind on the other, that writers have found the motives of that eager and sustained discussion of which the Sabbath has been the subject. Inasmuch as the developed importance of the usage has, with thinking men, admitted no question, if no more question had been raised concerning the

divine prevision and ordainment of such a day, two things would have attended upon the bare fact of the Sabbath institution: a most obvious and unanswerable argument for the divine origin of the Old Testament Scriptures, and equal argument for the permanent authority of an ordinance that was seen to have been aimed of God at such lasting effect. Upon both of these arguments, as absolutely fair and conclusive, a very large class of Christian writers have elaborately and confidently insisted.

Their opponents have had no resource but to deny the existence of any proof that the Old Testament rest-day was appointed by God as a usage necessary for men. Of such opponents there have been two chief classes. One of these, being truly reverent toward the Scriptures, have admitted the divine origin of the ordinance, but have claimed that it was a part of the ceremonial intended only for the nation of Israel and done away in Christ; so that the useful elements of the modern rest-day, however analogous to similar elements in the Sabbath of Moses, are held to be enjoined in no law of God. Of this representation it is an essential part that the early statement of the institution of the Sabbath, made Gen. ii. 3, where it fairly describes an appointment for the whole race, is nothing else than an anticipation by the historian, quite out of its date, of the narrow appointment to be long afterward made for Israel.

The other class of objectors have adopted more radical methods. As much of Old Testament text as connects the institution of the Sabbath with any choice of God, they set aside as unauthentic. Even then, however, the institution remains inwrought with writings so ancient that a philosophical objector feels bound to give some account of its presence there. This explanation is claimed to lie in the united facts that the Hebrews kept a festival of the New Moon; and that the intervals between the new moons (of 29½ days), when divided into quarters according to the successive "quarterings" of the moon would, most frequently, furnish periods of seven days. This theory has not attempted to show how lunar phenomena, thought to be distinct enough to effect the observance, now of a seventh day, now of an eighth, could have trained a people while still religiously intent on the phenomenon of the new moon, to override all phenomena in behalf of a strictly *seventh* sacred day. Such a substitute for the divine command being admitted, it would follow, of course, that the relation of the weekly rest-day to Christian worship and the world's advantage is a happy chance, involving no suggestion of the inspiration of Moses or of the authority of the Sabbath law.

In this relation of the opposing sides an element of the debate, as yet unnoticed, becomes of chief importance. The Mosaic Scriptures gave to the Sabbath so signal a preëminence above every other usage which they named as to predict and require its unexampled career. The Decalogue is by its form and contents marked off from all other writings, not only of Moses, but of all men. To moralists and philosophers of every class it stands as a fountain of law. Of the ten precepts that gave it name nine are accepted on all hands as of the essence of fundamental morality; the remaining precept being the law of the Sabbath. This collocation is the more remarkable by the fact that the Sabbath at that date, if viewed apart from its history and intended development, had no intelligible claim to be so advanced beyond all other Jewish usages. Nothing

short of the experience which the world has since had of its intrinsic relation to all practical morality and piety could ever have solved the wonder of its introduction into such a place. Then, when the ancient preface to the code asserts with unexampled formality and solemnity that God himself both framed and uttered it, and the subsequent narrative recites that God by a miracle recorded it, the contemporaneous assertion of a divine intent in the exaltation of the Sabbath law becomes complete. To this showing, however, response has been made, as by Paley in the statement: "That there are various passages in Scripture in which duties of a political, or ceremonial, or positive nature, and confessedly of partial obligation, are enumerated, and without any mark of discrimination, along with others which are natural and universal." He gives an example out of Ezekiel and another out of The Acts (*Moral Philosophy*, Book V., Chap. 7). The offer of such an offset to the force of a document organized with the unexampled symmetry, precision, and solemn majesty of the Decalogue is held by the believers in a divine and enduring Sabbath law to be trivial.

In the time of Christ the Sabbath had come to be encumbered with such formalistic additions as to give great value to the example and instructions by which he swept them away. He taught that "The Sabbath was made for man and not man for the Sabbath," a saying which could never have been fully understood, but for the world's continuous and enlarging experience of those adaptations to humanity that lie in the Sabbath usage.

In harmony with this lesson of their Master, the apostles were careful to relieve all Christians, both Jewish and Gentile, from every element of Sabbath observance that savored either of Jewish formalism as later times had developed it, or of Jewish ceremony as it had unquestionably entered into the Mosaic appointment. The ceremonial seventh day, whether of Pharisaism or of Judaism, manifestly maintains no warrant under the explicit words of Paul, Rom. xiv. 5, 6, "Let every man be fully persuaded in his own mind. He that regardeth the day" (evidently the seventh day still kept superstitiously by Judaizing Christians), "regardeth it unto the Lord; and he that regardeth not the day, to the Lord he doth not regard it." No more did that ceremonial sacredness pass into any other day; but the "Sabbath made for man"—the ordinance of the weekly day of rest and worship which was never abolished, not even when side by side the seventh day of Judaism and the Lord's day of Christians respectively waned and waxed—stands to this day, sustained by these consistent and abiding sanctions: of God's first appointment of the Sabbath after the creation (afterward sufficiently, though incidentally, attested in patriarchal history); of his reinstatement of the ordinance after the abode in Egypt, first by the miracle of the manna, and then by his own voice and finger from Sinai; of the example of Christ in behalf of the Sabbath, so long as the Jewish institutions lasted, and of Christ and his apostles in behalf of the weekly Lord's day, so soon as by his accomplished atonement Jewish ceremonies were all stripped away, leaving the indestructible substance of God's law for the race proclaimed in the Ten Commandments. In the double light of that law and of experience the Sabbath is a positive appointment of God, beyond invention by natural conscience, but binding to duty which is found to be so related to men's highest advantage of every sort that the appointment is a special attestation of God's rightful and loving government, and the obligation to obey is not formal but moral.

For the Jewish nation the Sabbath law was civil as well as religious. In Christian times the first civil recognition of the weekly rest-day was made by the Emperor Constantine, A. D. 321. To his

first statute additions were made by himself, and by Theodosius, A. D. 386. These laws prohibited such work as was not thought to be necessary, arrested military spectacles and heathen shows, and closed the courts. Additions were still made to them in the sixth century by the Eastern emperors. As early as the close of the seventh century similar laws began to be enacted by the Saxon kings in Britain. These met with additions and modifications under successive monarchs, until in 1676 was enacted under Charles II. the statute which, in substance, continues to be English law. From this sprang the laws of the several American colonies; out of which in turn have grown the present laws of the several American States. These, avoiding the mistake of requiring acts of worship, into which the spirit of their day led some of the colonial legislatures, are intent chiefly on forbidding unnecessary labor and traffic and the noisy amusements which would disturb public worship. In addition to these things, however, these American legislatures, especially, have given very noticeable attention to the opportunity which a weekly arrest of work offers to those businesses which supply temptation to dangerous appetites. Of the thirty-eight States now constituting the American Union thirty-six have Sunday laws. While all these provide against the sale of intoxicating drinks in so far as they are kinds of merchandise sold in shops, twenty-seven States make further express provision against the Sunday sale of intoxicants. The constitutionality of the so-called "Sunday laws" has been abundantly established in British courts and American.

Some protection of the weekly day of rest has been offered by French law, especially under the early emperors and by a statute of 1814, repealed in 1880.

The rest-day of Christendom is variously designated. In civil legislation and in such discussions and recitals as concern the civil and secular aspects of the observance it is commonly known as "Sunday," or "the first day of the week." Some Christians, notably the members of the Society of Friends, prefer to call it "First day." The New Testament has attached to it a name of obvious and peculiar significance—"the Lord's day" (Rev. i. 10)—a name which forbids all superstition or legalism, but doubly binds to essential duty. Since the enduring observance with its priceless advantages is to be traced straight back to the unchanging purpose and law of God, the ancient name lasts as long as the law, and now that the Judaizing superstitions that troubled the early Church have perished, the "Lord's day" is with all propriety called the "Sabbath."

(H. D. G.)

(For fuller discussion of the relations of the Sabbath to the Pentateuchal worship and institutions, see TABERNACLE.)

SABIN, JOSEPH (1821-1881), bibliophile, was born at Braunston, Northamptonshire, England, Dec. 9, 1821. He was for some years a bookseller in Oxford, but in 1848 he came to the United States, and ultimately settled in New York as an antiquarian bookseller and publisher. From 1856 to 1861 he pursued his calling in Philadelphia, but at the outbreak of the civil war returned to New York. As a bibliographer he had scarcely an equal, and such was his devotion to his specialty that he crossed the ocean twenty-five times in his hunt after old and rare works. He prepared catalogues of most of the valuable libraries that were sold at auction in his time in New York, among which may be specified those of Dr. Samuel F. Jarvis (1851), E. B. Curran (1856), G. B. Hazewell (1856), W. E. Burton (1861), Edwin Forrest (1863), John Allan (1864), and T. W. Fields (1875). Sabin republished on large paper limited editions of various old works illustrative of American history, and edited and published for sev-

eral years the *American Bibliophile* commencing in 1869. In 1867 he undertook the publication in parts of a *Dictionary of Books relating to America, from its Discovery to the Present Time*, of which he completed 13 volumes. He died at Brooklyn, June 5, 1881.

SACO, a city of Maine, in York co., is on the left bank of Saco River, six miles from its mouth, and 14 miles west of Portland. A bridge connects with Biddeford, to which it originally belonged, but being separated in 1762, it attained the dignity of a city a century later (1867). It has two national and two savings banks, an atheneum, a high school, ten churches, a public library, and a weekly newspaper. The industrial works comprise several large cotton factories, saw mills, machine shops, shoe factories, etc., which obtain water power from the falls of the river, which exceed 50 feet. The population in 1880 was 6389.

SACRAMENTO, the capital of California, and the seat of Sacramento co., is in 38° 33' N. lat., 121° 20' W. long., 33 miles by rail from San Francisco. The city is located on an extensive plain on the east bank of the Sacramento River, immediately south of the mouth of the American River. The streets are wide and cross at right angles. Those running east and west are designated by the letters of the alphabet, and those crossing them north and south are numbered, commencing at the Sacramento River. The business portion is built of brick, and the residence portion of wood. Shade trees are abundant, and almost every residence has a lawn and is surrounded with orange trees, palms, ornamental plants, and flowers.

The first railroad in California, extending from Sacramento into El Dorado co., was formally opened on Feb. 22, 1856. Work on the Central Pacific Railroad was commenced at Sacramento Jan. 8, 1863, by Gov. Leland Stanford, and this first overland road was completed May 10, 1869. Sacramento is on the line of the California and Oregon, Western Pacific, Central Pacific, California Pacific, and Sacramento and Placerville railroads. All of these roads are of the Southern Pacific system, whose shops here cover 25 acres of land and furnish constant employment to about 1800 men. The company's hospital is also located in the city. A line of steamboats runs to San Francisco on the Sacramento River and the bays, and another up the same stream to Red Bluff. The Sacramento River is spanned opposite the city by a railroad and wagon bridge, connecting it with the town of Washington, Yolo co., and the American River is crossed by two bridges. All the bridges in the county and all roads are free.

The capital of California was permanently located at Sacramento on February 25, 1854, and in 1869 the present capitol building, the finest in the State, was completed at a cost of about \$2,000,000. In the Capitol Park are the exposition pavilion of the State Agricultural Society and the State printing and electrotyping office, in which are printed, in addition to the usual work for the State, the textbooks for use in the public schools. The State Agricultural Society has also an extensive park for the exhibition of stock and a fine race-track. The State fairs are annually held in September. The Masons and Odd Fellows have each imposing temples. The United States Government has a post-office building which cost \$100,000. The County Court House (formerly used as the State Capitol) cost \$200,000, and a brick and iron Hall of Records cost \$50,000. The County Hospital, built on the pavilion plan, cost \$75,000, and can accommodate 175 patients.

There are in the city 1 national and 3 commercial and savings banks, 3 daily, 1 semi-weekly (German), 4 weekly newspapers, and 3 monthlies, and 17 churches. The Catholic Cathedral, now in course

of erection, will cost \$250,000. There are also 12 public-school buildings, 2 colleges, 4 private schools, and 1 art school.

The State Library contains 63,300 volumes; the Free Public Library of 12,000 volumes is maintained by a small city tax. The order of Odd Fellows maintain a library of about 8000 volumes. The Crocker Art Gallery is a brick and iron building three stories high, costing over \$100,000. It belongs to the city and contains some of the finest paintings in the State, together with an extensive cabinet of minerals, the property of the State. The paintings are valued at over half a million dollars. The State Capitol Park embraces 25 acres of land and the City Plaza 2½ acres. Both parks are lawned and planted with the choicest varieties of trees, shrubs, and flowering and ornamental plants, and fountains are appropriately placed. During the summer months semi-weekly open-air concerts are given at these parks by brass bands.

Sacramento is lighted with gas and electricity, most of the street lighting being furnished by the latter means. The water-works are the property of the city, and the water is supplied at a moderate charge.

The total valuation of property in the city is \$26,000,000, and the municipal debt on Jan. 1, 1889, was \$1,500,000. The municipal expenses for the year ending April 1, 1888, were \$517,555.78.

The city has 4 flouring mills, 4 planing mills, 2 box factories, 1 broom factory, 1 cannery, 2 wineries, 7 carriage manufactories, 2 spice mills, 3 potteries, and 5 foundries.

As in all cities in California the population is cosmopolitan. At present (1889) it contains 30,000 inhabitants.

In 1839 Captain John A. Sutter established a fort, now included within the city limits, but the city was not laid out until 1848, after the discovery of gold. The thousands of gold-seekers who arrived in the country came up the river to Sacramento in steamers and sailing vessels, and from that point proceeded by land to the mines. A canvas town was at first established on the river bank, and soon substantial buildings were erected. In 1849 the high waters overflowed the city, and levees were made. These however proved insufficient in the winter of 1861-2, when they were broken in the great flood and the city was again inundated. On Nov. 2, 1852, most of the business portion was burned, and again on July 13, 1854, a great fire swept over the same ground and destroyed all that had been rebuilt. The city is now protected with substantial levees against floods, and a paid fire department is maintained. The city was incorporated by the first legislature Feb. 27, 1850; on April 24, 1858, the governments of the city and county were consolidated; and on April 25, 1863, the present charter, providing for a city government only, was passed.

Sacramento is the commercial centre of a rich agricultural district, specially adapted to grape and orange growing. Its geographical position and transportation facilities enable it to command the trade of the entire northern half of the State.

SAFE DEPOSIT COMPANIES. Corporations for the safe keeping of valuable personal property, though of comparatively recent origin, are in operation in many of the large cities throughout the United States. Except in the State of New York, where their organization is provided for by general laws, they usually are created by special legislative acts, as was also the custom in that State until 1875, when a statute was enacted, authorizing the formation of stock companies for the purpose of taking

and receiving upon deposit as bailees, for safe keeping and storage, jewelry, plate, money, specie, bullion, stocks, bonds, securities and valuable papers of any kind, and other valuables, and guaranteeing their safety on such terms and for compensation to be agreed upon between them and their patrons. They were also authorized to construct and let out safes, vaults, and other receptacles necessary for the purposes of their business. Their affairs are managed by trustees, elected annually by the stockholders, the latter being jointly and severally liable for all debts to an amount equal to the par value of stock held over and above such stock. In the State of New York these corporations are under the supervision of the bank superintendent, to whom they make semi-annual reports and are subjected to annual examinations by him.

The Safe Deposit Company of New York, chartered April 15, 1861, with capital of one hundred thousand dollars, is said to have been the first distinct corporation formed for the sole purpose of safely keeping valuables and personal securities under guarantee, and the renting of fire and burglar proof vaults. January 1, 1888, the combined capital of the safe deposit companies of New York State alone was nearly three millions of dollars.

Prior to the organization of safe deposit companies, the vaults of banks of deposit and discount, particularly those located in cities, were burdened with boxes and valuable packages of stockholders and dealers to so great an extent as to be a source of serious inconvenience. Where such service was rendered by banks it was at best a disagreeable and unwilling one, involving risk without compensation, and the acceptance of trusts without responsibility. For this reason the forming of separate companies for the erection of substantial fire and burglar proof vaults on an extensive scale became necessary. The large capital employed by these corporations, ranging as it does from one hundred thousand to five hundred thousand dollars, admits of securing expert workmanship and the best of materials together with all improvements mechanical skill has devised for insuring strength and security in the construction of safety vaults, which are mostly built of combinations of metals such as welded plates of steel and iron, and homogeneous plates of hard and soft steel, Franklinite and chromic steel, etc., the quality of resistance lacking in one being supplied by the others. Not alone are the vaults securely built, but they are generally so constructed that they may be examined on all sides externally. The interiors are fitted up with tiers of safes and deposit boxes of sizes suitable for all requirements, enabling these corporations to offer their patrons not only a safe, but a safe within an impregnable fire-proof vault under surveillance of armed watchmen both day and night.

In books kept for the purpose are entered minute personal descriptions of their patrons together with mutually agreed upon private passwords to be used for identification. A person on renting a safe is furnished with the only key that will fit its lock, no two being alike. A safe-renter is not permitted to enter the vault until identified, nor can he open his safe without the assistance of a vault attendant, who first partially unlocks it to admit the key; various systems are employed by the different companies, such as the master-key and locked escutcheon covering keyhole. A safe-renter has the option of appointing a deputy to act in his stead, or of making one or more persons joint owners with himself. In the event of the death of a safe holder, no access is permitted to his safe, except on the production of legal authority, thus affording protection to the interests of lawful heirs.

Deposits may be made with these corporations in many forms and deliverable on such conditions as

may be agreed upon. Among others, by a person in his own name and for his individual account—in the name and for the account of another or others, of another or others with himself, deliverable wholly or in part, only to the party in whose name and for whose account deposited, or also to another; or if coupon bonds, and so desired, the bonds to himself alone and the coupons to another, or to either of several others as well as to himself, and then, if desired, only in the joint presence of two or more of them; a deposit may be made, delivery contingent, as "in escrow." A married woman may make, or have another make for her, a deposit in her own name, deliverable to herself only, or as she may direct; or a deposit of securities or valuables may be made under guaranty, the corporation assuming full and absolute liability for their value, guaranteeing safe keeping and delivery wholly or in part in accordance with the terms of agreement, whenever called for by the depositor or his legal representative. Safe-renters have access to the vaults as often as desired during business hours, and are furnished with private rooms in which papers or securities may be examined without fear of molestation. As a rule the officers and all employes of this class of corporations are pledged not to impart any information respecting their patrons, or of transactions had with them, except under compulsion of law.

The convenience and security combined with privacy and seclusion afforded by safe deposit companies has secured to them large and rapidly increasing patronage. (E. A. W.)

SAGINAW. See EAST SAGINAW.

ST. CLAIR, ARTHUR (1734-1818), pioneer and general, was born at Thurso, Caithness, Scotland, in 1734. He was a grandson of the Earl of Roslyn, and was educated at the University of Edinburgh. He had entered on the study of medicine with the celebrated surgeon, John Hunter, of London, when his receiving a large sum of money from his mother's estate in 1757, caused him to change his purpose and seek adventures in a military life. Purchasing an ensigncy in the 60th Foot he sailed with that regiment for America. Here he took part in the capture of Louisburg, and in 1759 being made lieutenant, distinguished himself under Wolf at Quebec. In 1760 he married at Boston Phoebe Bayard, a lady of Huguenot descent. He resigned his commission in 1762, and led a colony of Scotch settlers to the Ligonier Valley, Pa., where he had purchased a large tract of land. Here roads were cut, farms laid out, mills erected, and other improvements made. Besides holding various local offices, civil and judicial, St. Clair was a member of the proprietary council of Pennsylvania, and in 1775 he was made colonel of militia. Early in the next year resigning his civil offices, he led the Second Pennsylvania Regiment in the invasion of Canada. In this unfortunate campaign St. Clair's skill was displayed in helping to save Sullivan's army from capture. He was rewarded by promotion to be brigadier-general, Aug. 9, 1776. The rank of major-general was conferred Feb. 19, 1777, for his services at Princeton, and later when Burgoyne's army was threatening Northern New York St. Clair was placed in command at Ticonderoga. But he was compelled to evacuate this stronghold on July 4, since the British engineers had found means to gain the crest of Mount Independence and thus command the fort below. A clamor was raised against him, especially in New England, where the importance of Ticonderoga was greatly overrated. St. Clair was suspended from command until a court of inquiry could examine the case, yet he retained Washington's favor, and was a volunteer aide at the battle of Brandywine. The military court in September, 1778, declared that "Maj.-Gen. St. Clair is acquitted with the highest honor of the charges

against him." He was a member of the court-martial which condemned Major André as a spy, and was thereafter in command of West Point. He also assisted in quelling the mutiny of the Pennsylvania line, caused by their not receiving pay. St. Clair participated in the crowning glories of the siege of Yorktown and the capture of Lord Cornwallis. He remained in the South on military duty for two years later. On his return to Pennsylvania he again took part in the government, and in 1785 was sent to Congress, of which body he was president in 1787. In the next year he was appointed governor of the Northwest Territory. After making a treaty with the Indians at Fort Harmer in 1789, he established the capital of the Territory at Cincinnati, to which place he gave its name in honor of the society which had been formed by the officers of the Revolutionary army. Early in 1791 St. Clair was made general-in-chief of the army, and in the autumn he set out against the Indians of the Miami and the Wabash. He was, however, crippled with gout and had to be carried in a litter. Gen. Butler, second in command, was apprised on Nov. 3d of the approach of Indians, but did not communicate the fact to St. Clair, nor make any preparation. On the next morning the camp was surprised, and out of 1400 men 600 were lost. Congress investigated the case, and again St. Clair was pronounced the victim of circumstances beyond his control. He resigned his commission as general March 4, 1792, but continued as governor till November, 1802, when he was summarily dismissed by Pres. Jefferson. He retired to a small log-house on the summit of Chestnut Ridge, overlooking the valley of which he had once been proprietor. In vain he pressed the government for a settlement of his claims. The Pennsylvania legislature in 1813 granted him an annuity of \$400, and finally the U. S. government granted the veteran pioneer a pension of \$60 a week. He died at Laurel Hill, Pa., Aug. 31, 1818. He published a *Narrative of the Campaign of 1791* (1812). The publication of *The St. Clair Papers: Life and Public Services of Arthur St. Clair* (2 vols. 1882), edited by W. H. Smith, has placed in clearer light the merits of this general and the difficulties against which he had to struggle. (J. P. L.)

SAINT GAUDENS, AUGUSTUS, sculptor, born in Dublin, Ireland, March 1, 1848, was brought to New York when six months old. During 1861-66 he was a student, first at Cooper Institute, and then at the Academy of Design. He then went to Paris, where he studied for three years at the École des Beaux Arts under François Jouffroy. After a year spent at Rome, where his first work, *Hiawatha*, was produced, he returned to New York in 1872. He has since executed a number of notable works, of which the most important are *The Puritan*, a statue of Samuel Chapin (1887) in Springfield, Mass.; portrait statues of David G. Farragut (1880) in New York, Robert R. Randall (1884) at Sailor's Snug Harbor, Staten Island, N. Y., and Abraham Lincoln (1887) in Chicago; and portrait-busts of Wm. M. Evarts (1872-3), Theodore D. Woolsey (1876), and Gen. Wm. T. Sherman (1888). His statues are noted for vigorous and realistic treatment and their freedom from all conventionality. (F. L. W.)

SAINT JOSEPH, a city of Missouri, county-seat of Buchanan co., is on the E. bank of the Missouri River, 110 miles above Kansas City, and 133 miles S. S. E. of Omaha. It is on the Chicago, Burlington, and Quincy Road, which has branches hence to Kansas City, Council Bluffs, and other points. The Wabash, St. Louis, and Pacific Railroad, St. Joseph and St. Louis, St. Joseph and Grand Island, which connects with the main line of the Union Pacific Railroad, and St. Joseph and Des Moines (narrow gauge) are the other principal roads. The Missouri River is here crossed by a fine iron railway and foot

bridge, built in 1873 at a cost of \$1,500,000. It has 5 spans, one being a pivot-draw span of 365 feet. A few miles north another railroad bridge crosses the Missouri at Rulo, Nebraska. Among the principal buildings are the court house, city hall, high school, opera house, State Asylum for the Insane, and St. Joseph College. There are 32 churches, some having fine edifices; connected with the Roman Catholic churches are convents, parochial schools, and asylums. The see of the Roman Catholic bishop, formerly at St. Joseph, has been transferred to Kansas City. There are 21 public schools, including 4 for colored children. Five daily and 9 weekly newspapers besides other periodicals are published here. The streets have been greatly improved in recent years, \$158,600 being spent for this purpose in 1886. There is an efficient fire department. St. Joseph has 2 national, 1 savings, and 2 State banks. There are manufactories of stoves, architectural iron work, galvanized iron work, hardware, guns, wagons, carriages, brooms, furniture, beer, syrups, and clothing. The total value of the manufactures in 1886 was \$17,939,000. The wholesale trade for the same year was \$110,538,651. Pork-packing is largely carried on. St. Joseph was first settled by Joseph Robidoux, an Indian trader, who laid out the town in 1843. It was incorporated as a city in 1851, having already become noted as the starting point for the journey over the plains to the gold region of California. In 1859 the first railroad, the Hannibal and St. Joseph, reached this point. The outbreak of the Rebellion destroyed for a time the prosperity of the city. After the war the overland traffic, which had been diverted to other points, was slow in returning, but since the completion of its bridge, St. Joseph has regained a share of this commerce. Its population in 1870 was 19,565, and in 1880 it had increased to 32,431.

ST. LOUIS, the chief city of Missouri, is on the right bank of the Mississippi River, 20 miles below the confluence of the Missouri. It is 17 miles long by 6½ in its greatest width, and its municipal limits include 62½ square miles. It is laid out with generally straight streets, and in naming and numbering them the Philadelphia system has been followed. The U. S. census of 1880 showed a population of 361,704. Since that time no census of any kind has been taken, but the estimates for the past five years, from the most reliable sources, have given the following figures: 1884, 389,676; 1885, 406,530; 1886, 423,029; 1887, 428,358; 1888, 444,160. The increase is marked also by the number of new dwellings. In 1884 there were 2609 erected, valued at \$7,316,685; in 1885, 2670, valued at \$7,376,519; in 1886, 2223, valued at \$7,030,819; in 1887, 2490, valued at \$8,162,914.

The government of the city is still in the form of a municipal assembly, composed of a council of 13 members elected on a general ticket, and a house of delegates elected one from each of the 28 wards. The chief officer of the latter is the speaker. The elective officers of the city are the mayor, comptroller, treasurer, auditor, register, collector of revenue, marshal, coroner, sheriff, recorder of deeds, public administrator, the board of public improvements, and 11 assessors. The appointive officers consist, for the most part, of commissioners of water, streets, parks, sewers, health, and the harbor. The department of justice comprises, besides the supreme court of Missouri, the St. Louis court of appeals, a probate court, a circuit court, a criminal court, a court of correction, 2 police courts, and 14 justices of the peace. The militia consists of 4 companies, forming a battalion, and also 1 troop of cavalry. Besides the officers of the U. S. government usual in large cities, St. Louis has a quarter-master's department, an assayer, a Mississippi River commission, and the

See Vol.
XXI p. 183
(p. 192 Am.
Rep.).

cavalry depot at Jefferson barracks. The fire department consists of 26 steam engine companies, 4 chemical engine companies, and 7 hook and ladder companies. These are supplemented by an underwriter's salvage corps and the fire and police telegraph. The police department is controlled by the mayor and 4 commissioners; the State is divided into 6 districts, and the city police department is, virtually, a constabulary for the whole State of Missouri. 28 railroads centre at this point. The regular lines of steamboats up the Mississippi River number 4; to the lower Mississippi, 3; to the Missouri River, 2; and the Illinois River, 1. The number of street railroads in the city is 17. There are 3 hospitals, a morgue, an insane asylum, poor-house, work-house, house of refuge, 10 markets, 31 asylums and homes, 21 convents, 32 cemeteries, 8 boards of trade and exchanges, 23 banks and banking associations, 65 building associations, and 18 insurance companies, 2 of which are life companies. Besides the Public Library there are 14 libraries. The academies and colleges number 30; the public schools about 75, and the parochial schools about 80. The number of parks has increased to 22. The churches of the religious denominations number as follows: Baptist, 27; Christian, 4; Congregational, 14; Episcopal, 15; German Evangelical, 14; English Lutheran, 1; German Lutheran, 12; Hebrew, 8; Methodist Episcopal, 15; Methodist Episcopal (South), 9; New Jerusalem, (Swedenborgian), 3; Presbyterian, 26; Cumberland Presbyterian, 2; Reformed Presbyterian, 1; United Presbyterian, 2; Roman Catholic, 47; Unitarian, 3; miscellaneous, 19.

ST. PAUL, the capital of Minnesota, and county seat of Ramsey co., is on the Mississippi River, 2062 miles from its mouth. It is built on both sides of the river, which are connected by a fine iron bridge. The main part of the city is on

the second and third terraces from the river, but it occupies also the bottom lands along the river, as well as the upper plateau. The total area is nearly 14,000 acres. The estimated population in 1888 is 155,577, although as much as 185,000 is claimed. The new charter of 1888 gives the city 11 wards, and allows each to elect an alderman. A board of park commissioners has been created; and a board of education, consisting of 4 members, is appointed by the mayor to serve for two years. In 1887 \$12,000,000 were invested in new buildings, and the real estate sales were \$75,000,000. The assessed valuation of real estate is \$84,000,000. The bonded debt is \$4,162,421. During the year 1887 there were laid 55 miles of wooden sidewalks, 2 miles of stone sidewalks, 10 miles of asphalt pavement, and 14 miles of sewers. The fire department consists of 12 steam engine companies, 9 chemical engine companies, and 6 hook and ladder companies. The number of railroads is 12, of which the chief are the Chicago, Burlington, and Northern, the Chicago, St. Paul, Minneapolis, and Omaha, the Northern Pacific, the St. Paul and Duluth, and the St. Paul, Minneapolis, and Manitoba. The number of passenger cars transferred in the year is 260,000, and 20,000 passengers are in transit daily. Upon the Mississippi River the steamers carry 20,000 passengers, and 60,000 tons of freight annually. The jobbing trade has largely increased—the sales for the year 1888 being over \$100,000,000. Manufactures to the amount of \$35,000,000 are produced annually, giving employment to 20,000 men. Over \$3,000,000 are invested in the slaughtering and packing of meats. The enrollment of school children is over 12,000, and the number of teachers is 270; there are 25 public schools and 38 select schools and academies. The nucleus of a public library has been established. The new city and county building will cost \$1,000,000, and the new

opera house and hall of the Young Men's Christian Association are among the prominent features of the city. Many of the State institutions of Minnesota are located here. There are 12 asylums and hospitals, 17 banks and institutions, 8 boards of trade, and 3 regiments of State militia have their headquarters in the city. The cemeteries number 7. Nearly 70 newspapers and periodicals, daily, weekly, monthly, and quarterly, are published in St. Paul. The churches of the religious denominations number as follows: Advent, 1; Baptist, 11; Brethren, 1; Roman Catholic, 13; Christian, 1; Congregational, 1; Episcopal, 9; Evangelical, 3; Hebrew, 3; Lutheran, 14; Methodist Episcopal, 20; Presbyterian, 10; Reformed Episcopal, 1; New Jerusalem, 1; Swedenborgian, 1; Unitarian, 1; United Evangelical, 2.

SALA, GEORGE AUGUSTUS, English writer, was born in London in 1828, being the son of an Italian gentleman. Although he studied art, he has devoted himself to journalism and magazine writing. After being a contributor to *Household Words* and *Cornhill Magazine*, he established *Temple Bar* in 1860. As the correspondent of the *London Telegraph* he visited the United States in 1863, accompanied Napoleon III. to Algeria in 1864, reported the Paris Exposition of 1867, the German invasion of France in 1870, and Northern Africa in 1875. He travelled in Spain in 1875, in Russia in 1876, and in the United States in 1880. Among his books are *A Journey due North* (1858), relating to Russia; *Twice Round the Clock* (1859), sketches of London life; *Breakfast in Bed* (1863); *From Waterloo to the Peninsula* (1866); *Rome and Venice* (1869); *Cookery in its Historical Aspects* (1875); *America Revisited* (1882); various books of travel, and a novel or two.

SALEM, a city of Massachusetts, county-seat of Essex co., is on a peninsula in Massachusetts Bay, 15 miles N. of Boston, with which it is connected by the Eastern Railroad. Branch railroads run to Lowell, Lawrence, and other places. The harbor is good, but the trade is almost exclusively coast-wise, and limited to coal and ice. Among the noteworthy institutions are the East India Marine Hall, Salem Athenæum, Essex Institute, and Peabody Academy of Science. The city hall, the courthouse, and Plummer Hall are important buildings, and there are many fine mansions erected in the era of commercial prosperity. There are 6 national banks, 2 savings banks, 2 weekly and 2 daily newspapers, 20 churches, good public and private schools, including a high school and a normal school. The industrial works comprise cotton mills, jute factories, tanneries, iron foundries, and shoe factories. Salem is lighted with gas, and has water-works and a park. Its property is valued at \$25,000,000, and its debt exceeds \$1,000,000. It was founded in 1628 by John Endicott, and in 1692 was the scene of the famous Salem witchcraft. After the Revolutionary war the enterprising merchants of Salem established commercial relations with India and China, and these were soon flourishing, but the war of 1812 deranged them, and Salem's foreign commerce thereafter steadily declined. The city was chartered in 1836. It is closely connected with the towns of Beverly and Peabody. Its population in 1880 was 27,563.

SALEM, a city of New Jersey and county-seat of Salem co., is on Salem Creek, 32 miles S. of Philadelphia. It is on a branch of the West Jersey Railroad, by which it is 44 miles from Camden. It has a court house, 3 hotels, 1 national bank, 3 weekly newspapers, 8 churches, 7 schools, and a collegiate institute. Its industrial works comprise 4 glass factories, 1 oil-cloth works, 4 carriage factories, 5 canneries, a foundry, flour and planing mills. It has gas and water-works, and many beautiful residences. It is surrounded by a rich farming country, the pro-

See Vol.
XXI. p. 183
(p. 197 Am.
Rep.).

duce of which is shipped here for Philadelphia, with which it has communication by steamboat as well as by railroad. The village was settled in 1673 by John Fenwick. In 1880 it had 5056 inhabitants.

SALEM, the capital of Oregon and county-seat of Marion co., is on the E. bank of the Willamette River, here crossed by a fine wagon bridge built in 1886 and costing \$50,000. It contains the State house, penitentiary, insane asylum, 12 churches, an orphanage, and schools for the blind, deaf, and dumb, which receive aid from the State. A good system of graded schools, an academy and the Willamette University, a Methodist institution, make provision for education. There are 4 newspapers, 3 of which issue both daily and weekly editions. The city has waterworks, electric lights, and an efficient fire-department. Wide streets, handsome houses, and several parks give it an attractive appearance. Two miles from the city are the State fair grounds. The adjacent country is a rich agricultural section, containing many garden and berry farms. Salem in 1880 had a population of 2538, but this is now estimated to have reached 6000.

SALISBURY, EDWARD ELBRIDGE, Orientalist, was born in Boston, April 6, 1814, and graduated at Yale College in 1832. After taking the theological course at New Haven, he went abroad and spent several years in studying Eastern languages, in Paris under DeSacy and DeTassy, and in Berlin under Bopp. Appointed in 1841 to the new chair of Arabic and Sanskrit at Yale, he devoted another year to study at Bonn before assuming his office. His Inaugural Discourse was privately printed in 1843. He endowed the professorship of Sanskrit and resigned it to W. D. Whitney in 1854, but continued to teach Arabic till 1856. His fine Oriental library, including part of that of DeSacy, was presented to Yale. He has been a member of the Asiatic Society of Paris since 1838, of the Imperial Academy of Sciences and Belles-Lettres at Constantinople since 1855, and of the German Oriental Society since 1859. He has actively served the American Oriental Society as corresponding secretary and editor of its *Journal* for some years; he became its president in 1863. He has contributed to the *New Englander*, and privately printed a monograph on the Diodati family (1875); a lecture before the Yale art school on *Principles of Domestic Taste* (1877); and three volumes of *Genealogical and Biographical Monographs* (1885-88). In the latter he has been assisted by his wife. His degree of LL.D. was conferred by Yale in 1869 and by Harvard in 1886.

SALISBURY, ROBERT ARTHUR TALBOT GASCOIGNE CECIL, MARQUIS OF, prime minister of Great Britain, was born at Hatfield, in 1830. He was educated at Eton and Christ Church, Oxford, graduating in 1853. He was elected a fellow of All Souls' College and entered Parliament in the same year as member for Stamford, being then known as Lord Robert Cecil. On the decease of his elder brother in 1865, he assumed the title of Viscount Cranborne, and in 1868 he succeeded to the marquise of Salisbury. He was an earnest defender of the Established Church, and a frequent contributor to the *Quarterly Review* and other periodicals. In July, 1866, he was appointed Secretary of State for India, but resigned in the following March, being unable to accept the Reform Bill proposed by Lord Derby. He returned to the same office, however, in Disraeli's cabinet in March, 1874. He was sent in November, 1876, as special ambassador to Turkey to arrange the difficulties respecting the Christian subjects of that empire. Although the ambassadors of the great powers united in proposals which were urged upon the Ottoman Grand Council, that body almost unanimously rejected them. The ambassadors then left Constantinople, and the Russo-Turk-

ish war soon began. In April, 1878, Lord Salisbury succeeded the Earl of Derby as Secretary of State, and soon accompanied the Earl of Beaconsfield to the Congress of Berlin in which the new division of the Sultan's dominions was settled. The two British negotiators shared in the ovations which followed their return to England from their diplomatic victory. But they went out of office together in April, 1880, after Mr. Gladstone's Midlothian campaign. In May, 1881, Lord Salisbury was chosen as leader of the Conservative party in the House of Lords. In 1886, when Mr. Gladstone's bill for an Irish Parliament at Dublin was rejected and his ministry came to an end, the government passed into the hands of the Conservatives, and Lord Salisbury became premier. Although his majority in the House of Commons was obtained only by the support of Liberal dissidents who regarded Mr. Gladstone's movement as threatening the integrity of the empire, he succeeded in maintaining a longer lease of power than seemed possible at first. The breach in the Liberal party has proved permanent, the two branches being known as the Gladstonians and the Unionists. Parnell and his followers act with the former, while the latter still give their support to the Conservatives.

SALMON. The *Salmonidae*, as now restricted, is not a large family of fishes, embracing See Vol. XXI. p. 221 less than 100 species, but in beauty, activity, gaminess, food qualities, and to some extent in size of individuals, certain members of the family stand first among fishes. The group embraces several genera, of which we are here concerned with two only, *Salmo*, the salmon of the Atlantic, and *Oncorhynchus*, the Pacific salmon. Of the genus *Salmo* the most important species, economically considered, is *S. salar*, the common Atlantic salmon, which frequents alike the coasts of Europe and America, and is one of the most esteemed of all food fishes. Individuals of this species are commonly from 10 to 12 pounds weight and about 30 inches long, but often grow much larger, a salmon weighing 83 pounds having been brought to London in 1821. The color of adults is a steel blue above, the sides and under parts being of lighter hue, the dorsal and caudal fins dusky, the ventrals and anal white, while a few rounded spots are scattered above the lateral line. In rivers the color darkens, the males being known as red fish, the females as black fish.

This species spends half its life in the ocean, though quite capable of remaining during all its life in fresh water, as is proved by its existence in land-locked lakes. The salmon of Lake Ontario are thought never to migrate to the ocean. The land-locked salmon is known as variety *sebag*, and differs somewhat from the migratory form. *S. salar* ascends the rivers annually to spawn. In the ocean it subsists on crustacea and their eggs, small shrimps, young crabs, etc.; in the rivers on small fish. It is supposed to eat little during its river residence, yet bites eagerly at the bait of anglers, and forms a favorite sportsman's fish. It ascends to the head waters of streams, leaping cascades and other impediments with great energy and persistence, and depositing its spawn in the sands or gravels at the river's head. For this purpose it digs deep furrows which it covers up after the eggs are deposited. A fish of 8 pounds is estimated to lay about 6000 eggs; one of 40 pounds, 15,000. The salmon are lean and unwholesome after spawning, but generally survive and return to the ocean. The young fish, which are known as parr, remain in the rivers from one to two years, and weigh but a few ounces when they pass out to sea.

S. salar is found in all the rivers of northern Europe, in America from Labrador to the Delaware River, and in the Great Lakes as far as Niagara. It

Salmon (*Salmo Salar*).

was formerly exceedingly abundant in all the rivers of the Atlantic slope north of the Potomac, but has been killed out by over-fishing and other causes, and is now practically unknown throughout that region. In early colonial days salmon were found in profusion in the Connecticut River, but by the injudicious devices of man they have been completely exterminated. A dam built in 1798 about 100 miles above the mouth of the river was the apparent cause of the extermination. The fish were unable to pass this obstacle and reach their spawning ground, and after a few years' despairing efforts abandoned the stream. The same has been the case with other rivers, and the salmon fisheries of the Atlantic coast are extinct. In 1850 the catch of Maine was valued at nearly \$21,000, that of Massachusetts at \$33,000, while not a fish is recorded as caught in any other Atlantic State. Measures are at present being taken to restock the rivers of those States, though with what success remains for the future to decide. In British America the catch is larger. New Brunswick's annual catch is estimated at a value of \$800,000. As many as 40,000 fish have been caught in one season at the mouth of the St. John River. The most of the salmon of this region are sent fresh to the United States. At the entrance to the Miramichi 400,000 pounds are annually put up for export. The yield here has greatly increased through protection to the fish during the spawning season. Salmon formerly abounded in Lake Ontario. In 1836 two men took 230 fish in 4 hours by spearing. Since then there has been a rapid decrease through the effects of factory waste thrown into the rivers. Salmon were formerly very abundant in the rivers of the British Islands, but have been killed out of the Thames and other streams by sewage. The greatest yield now is from Ireland.

The most valuable salmon fisheries now existing are those of the Pacific coast region of North America, where salmon were formerly so extraordinarily abundant that the rivers occasionally became choked with the multitudes of ascending fish. Man's injudicious industry has succeeded in greatly reducing the numbers of migrating salmon, though the fisheries are still of great importance and the annual catch of high value. The Pacific fish comprise several species of the genus *Oncorhynchus*, of which the largest and most valuable is *O. tshawytscha*, the quinnat or king salmon, as it has been well named. This species is the largest of the family, averaging in weight on the Columbia 22 lbs., on the Sacramento 16 lbs., but occasionally attaining a weight of from 60 to 90 lbs. It is found along the coast from Lower California to Kamtchatka, but most abundantly in the Columbia, where it is commonly known as the Chinook salmon.

The quinnat is a beautiful fish, its body being silvery in hue, the back, with the dorsal and caudal fins, being marked with round black spots. In the fall it becomes black or dirty red in color. As a food fish it is of unsurpassed excellence, its flesh closely resembling that of *S. salar* in flavor. It does

not feed in fresh water and dies after spawning, except perhaps in some of the shorter rivers. At the upper waters of the Columbia and other long streams the bodies of the fish appear bruised, the fins mutilated, the eyes injured, patches of white fungus on the body, while numerous parasites sap their strength. It is probable that all die immediately after spawning.

Fifty years ago this fish was hardly known; now it is eaten all over the world, being carried in cans and otherwise to all ports. The embryo fish are being transported to the principal northern countries of Europe, to Australia, and New Zealand, with the hope of adding this species to the food fishes of those regions. In its native habitat the annual catch is enormous. The Columbia River alone, during the six years ending in 1880, yielded nearly 200,000,000 lbs., with no serious diminution of stock. Yet that river is being fished with so little thought of the future that if the rate of destruction is continued its fisheries must become valueless before many years. Among the murderous devices adopted is that of the fish wheel, which throws the fish ashore in shoals, and permits scarcely an individual to escape. It is only the August and September run which now keeps up the supply. This is not molested, but the spring run is almost totally destroyed. It is doubtful if this amount of protection is sufficient, and other means need to be adopted to prevent the exhaustion of the fish. An efficient salmon hatchery is important for this purpose, and active efforts to restock the river in this way are now being made. In 1880 more than 1,500,000 fish were canned, being the largest number taken to that time. The Sacramento also yields abundantly, while the smaller rivers along the coast add to the grand total, the economic value of the quinnat fisheries exceeding that of all others combined on the Pacific coast. The total product of the salmon fisheries of the United States in 1880 is given at 52,000,000 lbs., of which Oregon yielded 39,500,000 lbs. To this may be added the catch of British Columbia, estimated in 1881 at 7,448,000 lbs., of a gross value of £894,000. The value of the United States canned salmon is given at \$3,255,365, this covering 31,453,000 pound cans. Since 1880 over-fishing has rendered the salmon industry much less profitable. (For some further particulars, see OREGON.)

In addition to their human enemies it may be stated that the salmon are destroyed in great numbers by foes of their own kind. In the rivers chubs, suckers, and other small fish devour the eggs and young, while in the ocean the mature fish find a dangerous enemy in the seals, which destroy them in multitudes.

There are several other species of *Oncorhynchus*, including *O. keta*, the dog salmon, which averages 10 to 12 lbs. in weight; *O. gorbuscha*, the hump-backed salmon, a small species; *O. kisutch*, the silver salmon, averaging 7 to 10 lbs.; *O. nerka*, the blue-backed salmon, averaging about 8 lbs. These all range along the coast from California to Kamt-

chatka, the last named reaching to Japan. *O. nerka* has a considerable run in the Columbia, and is the principal spring salmon of the Frazer River. It is the most graceful in form and handsome in color of all the salmon, and is an excellent food fish, its flesh being similar to that of the quinnat, but less firm and more watery.

The artificial propagation of salmon has been prosecuted actively of late years under the direction of the United States Fish Commission, which has established hatching stations at several localities. Probably the most important of these is that on the McCloud River, California. This hatchery, established in 1873, had by 1884 taken 67,000,000 eggs, most of which were distributed through the Union, though several millions were sent to foreign countries. About 15,000,000 were hatched at the station and placed in the several rivers of that region. As a probable result it is stated that the Sacramento catch has increased 5,000,000 lbs. annually for several years past. In 1888 about 5,000,000 fry were hatched at this station and placed in the Colorado and the shorter rivers of Oregon and California.

At the Bucksport station, Maine, about 2,500,000 eggs of the Atlantic salmon, *S. salar*, were taken in 1884, the fry being placed in the tributaries of the Hudson, Delaware, etc. About 1,000,000 eggs of the landlocked or Schoodic salmon (*S. salar* var. *sebagi*) were taken and variously distributed. This activity in propagation cannot fail to have highly important results, and if in common with it efforts are made to provide proper fish-ways in our rivers and to prevent the influx of sewage, there is no reason why our salmon fisheries should not regain their former value. (For a consideration of other species of genus *Salmo*, see article TROUT.)

(C. M.)

SALMON, GEORGE, Irish clergyman and mathematician, was born at Dublin, Sept. 25, 1819. He was educated at Cork and at Trinity College, Dublin, graduating in 1839, and being chosen a fellow of the college in 1841. He had studied theology as well as mathematics and was ordained in 1844, but retained his fellowship until 1866, when he was made regius professor of theology in Dublin University. His mathematical works on *Conic Sections*, *The Higher Plane Curves*, *Geometry of Three Dimensions*, and *Modern Higher Algebra*, have been translated into several languages and have obtained for him the doctor's degree from both Oxford and Cambridge, as well as other marks of honor from scientific societies. In 1878 he presided in the mathematical and physical section of the British Association at its meeting in Dublin. His religious works consist of three series of *College Sermons* (1861, 1873, 1881), and an *Introduction to the New Testament* (1885).

SALT. This highly useful mineral substance is the chloride of sodium, being compounded of 60 parts by weight of chlorine and 40 of sodium. It is exceedingly abundant in the waters of the ocean, which contain in every 1000 parts 33.8 parts of saline substances, of which 26.8 parts are common salt. The ocean is estimated to contain in all 3,000,000 cubic miles of this substance, which has probably been washed from rock deposits during the long geological ages, its easy solubility facilitating this process. In its solid state it forms colorless, transparent, anhydrous crystals of the isometric system and with very perfect cubical cleavage, which generally displays itself in the great masses of rock salt. It occurs in the rocks most frequently in the condition of brine, though great deposits of rock salt are known, some of which have been mined for many centuries. The origin of rock salt is not very well understood. Some beds have been pro-

duced by the drying up of bodies of salt water cut off from the ocean, but in cases where the salt forms a perpendicular vein its origin cannot so easily be accounted for. As beds occur, however, in early geological strata this effect may have been due to rock-tilting forces. Lakes of brine yet exist in many regions of the earth, some of them doubtless due to cut-off bodies of sea water, others to salt springs, or the flow of underground water over deposits of rock salt, as in the case of the Great Salt Lake. Some of these lakes surpass the ocean in their percentage of salt, probably through the effect of evaporation.

The countries of Europe, with the exception of Norway, Denmark, and Holland, are supplied with salt from domestic sources, some of it being obtained from evaporation of sea water, while more generally the supply comes from salt springs and the mining of beds of rock salt. Of the latter the mine of Wieliczka, near Cracow, Austria, is the most notable instance. This mine is two miles long and one broad, and 1000 feet deep. Elsewhere in the Eastern Hemisphere, as in Russia, India, and China, salt exists in great abundance, the salt mines of the latter country being of great depth and very great number. Africa also is well supplied with salt, and the same is the case with South America, in which country the salt of Patagonia is largely exported to the remainder of the continent, it being of unusual purity and requiring no preparation for use. As a rule salt is vitiated by more or less impurity, sulphate of lime, oxide of iron, clay, and several other substances reducing the purity of rock salt, which needs considerable preparation to fit it for table use.

Salt abounds in the United States, ordinarily as brine, though several deposits of rock salt are known. Originally the supply of the colonies was obtained by evaporating the waters of the ocean, let in to shallow places along the coast and exposed to solar heat. What is now used is principally obtained from the waters of saline springs and wells, evaporated by solar heat or by boiling. The earliest worked and one of the most important of the brine deposits of the United States is that of the Onondaga district of Central New York, extending for a considerable area around the city of Syracuse. The whole middle portion of the State, indeed, seems underlain by salt in some form, the wells being unusually rich both in the quality and quantity of their brine. This district has yielded salt from an early period in the history of the country, and is worked to-day on an extensive scale, the salt water being pumped from numerous wells, and run into large vats or shallow reservoirs, where it is exposed to the evaporating action of the solar rays. There are more than 40,000 of these vats in use, besides several hundred factories in which the salt is obtained from the brine by boiling. The finest grades of New York salt are considered equal to the famous Ashton salt, of the mines of Cheshire, England. In several places beds of rock salt have been discovered during the boring of artesian wells. One of these, found in 1887 near Ithaca, at a depth of 2600 feet, is 250 feet thick. Such beds may be the origin of the brine elsewhere found. The salines of New York belong to the State, which at one time charged a considerable royalty for their use. At present the royalty is one cent per bushel, which no more than pays the expense of pumping, which is done by the State. The maximum product of the Onondaga wells was in 1862 9,053,874 bushels. It has since fallen off through the effect of severe competition from other States. The product in 1887 was 5,695,797 bushels. In the Warsaw district there were also produced in that year 6,072,000 bushels.

The salt deposits of the United States extend widely through the geological strata. Those of New York are in the Upper Silurian; most of those from

See Vol. XXI. p. 223 (p. 239 Am. Rep.).

Pennsylvania to the Mississippi in the Lower Coal measures, while in Louisiana beds of rock salt occur in the Tertiary. The salt district of Pennsylvania is found along the Allegheny and other rivers of the western part of the State. The yield of those wells was over 1,000,000 gallons in 1860, but has declined since. West Virginia has important deposits in the valley of the Great Kanawha, which in 1870 yielded 4,633,750 bushels, though the yield here too has fallen off. In 1887 it was estimated at 1,125,000 bushels. In Southwest Virginia beds of rock salt occur, and there are brine wells of no great importance in this State and North Carolina. Ohio possesses some important wells, which in 1887 yielded 1,125,000 bushels. But the most important of our salt-yielding States is Michigan, whose salines are of remarkable richness. The wells of this State lie in the vicinity of Saginaw Bay. They seem inexhaustible in supply, and have been opened in considerable numbers, many of them being sunk to a depth of more than 1000 feet below the surface level of Lake Michigan, and some to 1900 feet. The Michigan wells yielded in 1870 3,106,760 bushels, in 1880 12,425,885 bushels, and in 1887 19,721,545 bushels. This very rapid development is due to the great strength of their brine, which is twice that of the New York wells, and more than twice that of the other States mentioned. The cheapness of fuel is also an important item. It is to this unequal competition with Michigan, and with the equally rich brines of Goderich, Canada, that the falling off in the produce of New York, West Virginia, Ohio, and other States is due.

Saline springs and salt wells are common in the valley of the Mississippi, being found in Illinois, Indiana, Kentucky, and Tennessee. West of the river they occur in Missouri, Arkansas, Nebraska, and Kansas, the latter State having valuable saline springs, rich in salt, in the valley of Solomon River. In Louisiana salt is also abundant. In the north-western part of the State are the "licks," so named from the habit of forest animals to resort there to lick the salt. They consist of springs of weak brine. Near the Gulf border of the State, on an island in a sea marsh near New Iberia, named Petite Anse or Avery's Island, is an immense deposit of rock salt of unusual purity. This salt is mined by the aid of a shaft sunk to the depth of 190 feet, and passing through 165 feet of solid salt. From the shaft chambers extend in various directions, they being 35 to 40 feet wide, and 65 feet high. Above them is a roof of rock salt 55 to 60 feet thick which is supported by columns of salt 42 feet square. The area of the mass is 144 acres, and its quantity of salt is estimated at 28,600,000 net tons. The production has increased from 25,550 tons in 1882 to 47,750 tons, valued on the spot at \$118,735, in 1887.

Through Kansas, Western Arkansas, Indian Territory, Northwest Texas, New Mexico, and Utah, extends a vast plain of Cretaceous age, in nearly every part of which salt lakes and incrustations appear along with vast masses of gypsum. Of these lakes much the most extensive and famous is Great Salt Lake, about 75 miles long and 30 wide, its waters containing 20.2 per cent. of common salt and 2 per cent. of other salts. Northward from this region, in the Rocky Mountain district, salt springs occur, and beds of rock salt of great extent and purity are reported in the Yellowstone Valley. In the southern part of Utah large deposits of rock salt are said to exist, their supply practically unlimited. Nevada is credited with deposits of extraordinary extent. On Virgin River, in the southeast part of the State, there is a bed of rock salt resting on granite which is said to extend as a bluff for more than 25 miles along the river, being in some places several hundred feet high. More than 60 per cent. of the entire cliff is rock salt of a purity of 90 per

cent. This remarkable outcrop is of a pale green color and ice-like transparency. Further up the river, on its west side, is a less extensive salt hill of a dazzling white color. These beds are not yet worked, the salt needed being obtained from saline springs and from an extensive saline marsh which deposits an incrustation of impure salt as fast as it is removed, several crops being obtained in a year. This is used in metallurgical processes. In Eastern Arizona is a shallow salt lake whose salt is precipitated by evaporation at one season, while salt water accumulates again at another season. The inhabitants bring their wagons here and help themselves freely. California has saline springs and salt marshes nearly as extensive as those of Nevada, but obtains its principal supply from the evaporation of sea-water in lagoons along the coast. The lagoons of the Bay of San Francisco yield not less than 25,000 tons annually. There is a very large demand for salt in this State as an aid in the reduction of silver ores and similar operations, which consume about 30,000 tons annually. The remaining States and Territories of the Pacific slope have abundant salt within their borders for local purposes. The United States indeed has an inexhaustible quantity of this important and necessary mineral, while the coast region affords many facilities for the obtaining of abundant supplies by the evaporation of sea water. The total product of salt in this country in 1880 was 29,805,298 bushels. Of this the great bulk came from four States, Michigan yielding 12,000,425; New York, 8,742,203; Ohio, 2,650,301; and West Virginia, 2,679,438 bushels. The total product for 1887 was 39,159,810 bushels, of which Michigan produced 19,721,545, New York 11,767,845, Ohio 1,815,000, Louisiana 1,705,465, Utah 1,625,000, and West Virginia 1,125,000. (C. M.)

SALT LAKE CITY, the capital of Utah Territory, and capital of Salt Lake co., is at the base of the Wahsatch Mountains, 11 miles from Great Salt Lake. The area of the city proper is about 12 square miles, but the corporate limits include about 50 square miles. Through it runs the Jordan River, and besides the water derived from City Creek Canyon and other streams for household purposes, a canal 25 miles long brings water from the upper part of the river for irrigation. The streets are 137 feet wide and the blocks 40 rods square. There are 13 miles of main water pipes, and about 12 miles of gas mains. The city is lighted by both gas and electric light. Places have been reserved for four or five large parks, but they have not yet been improved. The Utah Central, and the Denver and Rio Grande Railroads connect the city with the Union Pacific and the Central Pacific Railroad at Ogden. The Utah and Northern Railroad runs into Idaho and Montana. The other railroads are the Utah and Nevada, the Salt Lake and Western, the Bingham Canyon (narrow gauge), the Wahsatch and Jordan Valley. Street cars run to all parts of the city. The Western Union Telegraph Company gives communication with all the world, and the Deseret Company with the territorial towns.

The city government is vested in a council, composed of the mayor, five aldermen, one for each of the wards, and nine councillors, elected triennially. Great Salt Lake City was incorporated by the Assembly of the provisional State of Deseret, Jan. 19, 1851, and this Act was adopted by the legislature of Utah Territory in October of that year. Its bounds were enlarged in 1867 to include the district west of the Jordan, but in 1872 they were diminished on the southern side. In 1868 the name was shortened to Salt Lake City. It has been the seat of the territorial government since 1856, and has always been the most important city in the Territory commercially. It was settled by the Mormons under Brigham Young in July, 1847, after they had been

driven from Nauvoo, and was originally governed by an ecclesiastical council. The Mormon influence is still great, and the city is divided into 21 ecclesiastical wards. The finest public buildings are religious, including the Mormon temple, the tabernacle, a peculiar huge oval-shaped structure, accommodating over 7000 persons, and containing an organ, second in size only to that of Boston.

There are also fine churches of various denominations, including St. Mark's Cathedral. The building of Deseret University was finished in 1887, and there are other educational structures. St. Mary's Hospital is a handsome building. There are many places of public amusement, the chief being Salt Lake Theatre and the Walker Opera House. The Deseret Museum and Salt Lake Mining Institute show the vast mineral resources of the Territory. Manufacturing has only recently been commenced in Salt Lake City.

The Mormons have been industrious and their patient labor has effected a wonderful change in the natural condition of the city and vicinity. The exclusive policy which they pursued for many years has ceased, and the adherents of other religions are increasing in number. Evidences of the difference in religious belief abound on every side. The newspapers are ranged as Mormon and anti-Mormon. There are four daily papers which issue also weekly and semi-weekly editions, and there are two Swedish weekly papers. Some religious periodicals are also issued.

SALVINI, TOMMASO, Italian tragedian, was born at Milan, Jan. 1, 1830. He was educated chiefly by his father, who was professor of literature at Leghorn. His youthful predilection for the stage received encouragement, and he was trained for a time by the celebrated tragedian, Gustave Modena (1803-1861). Both his parents died when he was 15 years old, and in consequence he gave up theatrical study for two years. Then he entered the Royal Company at Naples, but left it to fight for Italian independence. He was afterwards engaged in the troupe of Domenico, with whom he spent six years. Then he retired for a year from the stage to give himself to serious study of the dramatic classics. His principal characters in Italian tragedy have been Egisto in Alfieri's *Merope*, Paolo in *Francesca di Rimini*; in French, especially Orosmane in Voltaire's *Zaïre*; and in Italian versions of Shakespeare, Romeo, Hamlet, and Othello. In 1865 on the 600th anniversary of Dante's birth the four greatest actors of Italy were invited by the city of Florence to perform in Silvio Pellico's tragedy, *Francesca di Rimini*. The parts assigned were, to Madame Ristori, Francesca; to Salvini, Paolo; to Rossi, Lancelotto; to Majeroni, Guido. Rossi feared, however, that he would not be able at short notice to do justice to the part of Lancelotto, and Salvini, his senior, courteously assumed that part, and gave to Rossi the more important rôle of Paolo, in which he was already famous. The result was that Salvini played Lancelotto with such astonishing force as to attract marked attention to himself. The grateful city of Florence presented him with a statuette of Dante. Salvini visited the United States in 1874, and again in 1881. His personation of Othello especially was received with great enthusiasm. He played it at times in connection with Edwin Booth's rendering of Iago in English, and both actors shared the triumph of impressing an audience under such unusual difficulties. Salvini's last appearance in England was in 1884. The elements of his success may be summed up in his splendid physique, noble bearing, perfect elocution, dramatic power, and vehement passion. When in 1868 he performed in Madrid in *La Morte Civile*, the audience carried away with the intense realism of the death enacted before them rushed upon the stage to see if the actor were yet

alive. Salvini received the honor of knighthood from King Victor Emmanuel.

SAMARIA AND SAMARITANS. Samaria was the capital of the Northern kingdom of Israel, but Prof. W. Robertson Smith's statement that "while it stood, Samaria and not Jerusalem was the centre of Hebrew life" needs modification. The

Northern kingdom was larger than the Southern in territory and population, but its political importance and its position as to wealth and civilization varied at different periods. With the accession of Jehu, it became tributary to Assyria, while, so far as appears, Judah maintained her independence for some generations longer. Place as high an estimate as we may upon such kings of Israel as Omri, Ahab, and Jeroboam II., they do not make more of a figure than Asa, Jehoshaphat, Jehoash, and Uzziah. According to the Biblical accounts (and there are no accounts at all to the contrary), Jerusalem steadily maintained from the days of David a magnificence to which her northern rival never attained. The Northern kingdom had, indeed, distinguished prophets, but so had the Southern, and the Northern prophets paid a respect to the kings of the line of David such as we have no account of their own sovereigns receiving from the Southern prophets, e. g., 2 Kings iii. 14, Hos. iii. 5, cf. Am. ix. 11. At various points in the history, and notably in the reigns of Jeroboam I., Baasha, Jeroboam II., and Hoshea, we have intimations that citizens in the Northern kingdom regarded Jerusalem as the religious centre of the worship of Jehovah, while there is no intimation that Samaria was ever so regarded even by her own citizens.

It is doubtless true that among the people and the religious sect that, in later times, were called SAMARITANS, there was a stronger admixture of the blood and of the traditions of the ancient Northern kingdom than such Jewish writers as Josephus are willing to admit; but this fact contradicts instead of sustaining certain conclusions drawn from it by Prof. Smith in the article in the *ENCYCLOPEDIA BRITANNICA*. That article teaches that the priestly law in the Pentateuch "was first published by Ezra as the law of the rebuilt temple of Zion;" that the completion of the Pentateuch was later than this; that the Samaritans, hitherto knowing nothing of the Pentateuchal institutions, and at this time being at bitter feud with the Jews, yet "derived their Pentateuch from the Jews after Ezra's reforms, i. e., after 444 B. C.;" and yet that in 432 B. C. this "foundation of a community of the Law in the Samaritan country, among the mixed population whom the Judean leaders did not venture to receive into fellowship," "a community bitterly hostile to the Jews, and yet constituted in obedience to Ezra's Pentateuch," was an accomplished fact. The author is conscious that this "must appear a very remarkable exploit;" that among these people who did not accept the historical and prophetic books, and who, therefore, could not, like the Jews, be reasoned with by arguments drawn from those books, "the acceptance of the Pentateuch implied a tremendous breach of continuity;" especially since, sudden though it was, yet "having got the Pentateuch, they followed it with a fidelity as loyal and exact as the Jews themselves, save in the one matter of the change of the sanctuary." He is correct in this. On the basis adopted by him, the exploit is so remarkable as to be impossible; the breach of continuity is too tremendous to be credible. We must look for some more satisfactory account of the matter.

The statement that the breach between the Jews and the Samaritans was made absolute by "the expulsion from Jerusalem in 432 B. C. of a man of high priestly family who had married a daughter

of Sanballat" is correct, save in two particulars: the date should be in or after 432 B. C., and this daughter of Sanballat may have been of a younger generation; there is just the same reason for describing her as a woman of the Sanballat family that there is for calling her husband a man of high priestly family. The statement that probably "this priest is the Manasseh of Josephus, who carried the Pentateuch to Shechem, and for whom the temple of Gerizim was built" is correct, save that the alleged fact that Manasseh took the Pentateuch to Shechem is not drawn from the Bible or from Josephus, but is made to measure, to fill an otherwise vacant place in the theory. But it does not follow that Josephus testifies falsely when he says that the Manasseh in question was the brother of Jaddua the high priest, and that the Gerizim temple was built in the time of Alexander the Great, though it must be admitted that the Sanballat whom Josephus makes to have been associated with Manasseh in the time of Alexander the Great cannot have been the Sanballat of Nehemiah.

It is not unlikely that the head of the Sanballat family may have had successors of the same name. The expulsion of the priest who married into that family occurred, according to Neh. xiii. 28, after 432 B. C. and before the death of Nehemiah. The date of Nehemiah's death is unknown, but as the accounts make the impression that he was a very young man in 445 B. C., he would not be extraordinarily long-lived if he lived long enough to witness the marriage of a youth who was still living, in a vigorous old age, when Alexander captured Tyre, B. C. 332.

This correction of the data of the article in the BRITANNICA, while fatal to the general theory with which that article is connected, might yet help out that part of the theory directly used in the article, for it allows a century instead of a decade for the differentiation of the Samaritan religion. But even with this extension of time, the eager acceptance of the Pentateuch by the Samaritans cannot fairly be explained, if the Pentateuch is of post-exilic Jewish origin.

The Samaritan traditions are, of course, to the effect that the Pentateuch came down to them from ancient times, and while there is here a lack of proof, there is nothing unreasonable or contrary to any known fact in the supposition that the tradition is to this extent true. That "the Samaritan character is an independent development of the old Hebrew writing" is a fact, but that indicates nothing as to "the time when they first got the Pentateuch;" at most, it only points to the time when they and the Jews began to use different alphabets in writing the Pentateuch.

As to the text of the Samaritan version, the assertion that "the Samaritans had no opportunity of revising their text by Judean copies" is, of course, gratuitous, though not important for any point now under consideration. "That from the first their text ran a separate course" is probable, and shows that this text has some independent value as a source of text criticism; but the assertion that "in Judea also there were important variations between MSS. down to the time of the Septuagint and even later" stands on a different footing. See SEPTUAGINT. In fine, there is much in the relations between the Jewish text, the Samaritan text, and the Septuagint, which needs no other explanation than the following statement of fact excerpted from the article in the BRITANNICA: "Samaritans as well as Jews were carried to Egypt by Ptolemy Lagi; the rivalry of the two sects was continued in Alexandria (Jos. Ant. XII. i. 1), and Hellenized Samaritans wrote histories and epic poems in Greek with exactly the same patriotic mendacity which characterizes Jewish Hellenism." (W. J. B.)

SAMSON. As regards the name of this judge of Israel, the statement in the BRITANNICA that the Masoretic pronunciation *Shimshon* is more modern than that followed by the Septuagint, whence comes our "Samson," is not a well-settled fact, but only a conjecture.

As regards his history, attention to the comparative syntax of the closing verses of Jud. xv. and xvi. will throw light on these accounts. Jud. xv. 20 begins with *Waw* consecutive, and may easily be understood to mean that Samson judged Israel twenty years, beginning with the battle at Lehi, and as the sequel to that battle. The concluding statement of Jud. xvi. 31, on the other hand, is a circumstantial clause, retrospective in its effect: "he having judged Israel twenty years." With this agrees everything in the narratives concerning Samson. In chaps. xiv., xv. we have stories in regard to his wild youth, and in xvi. two stories in regard to the latter months of his life, while the twenty years during which he was judge of Israel come between the two.

That the twenty years were with him years of more serious purpose than those concerning which details are given, that in them he actually accomplished the deliverance for Israel which it had been promised he should accomplish, may fairly be inferred from a certain characteristic difference between the two parts of the narrative. In his youth, before he was judge, in the part of his career covered by xiv.-xv., the Philistines are represented as lords of Israel, coming up into the country at their pleasure; in his last months the narrative in xvi. represents them as keeping on their own side of the frontier, and making no attempts on Samson except as they can catch him across the border. The difference between the two situations is wide, and is doubtless to be regarded as due to the ability of Samson the judge. It was after these years of good service that he allowed himself to relapse into follies like those of his youth.

With this view of the case there is no reason for counting Jud. xv. 20, and xvi. 31, last cl., as mere "editorial notes which belong to the chronological scheme of the book of Judges;" it is at least equally appropriate to regard them as part of the narrative itself. There is no contradiction between these verses which call him judge and the rest of the narrative. The representing of him "as a popular hero of vast strength and sarcastic humor" is not inconsistent with his being also judge and "the deliverer of Israel." No one who calls to mind how mixed are the motives from which men usually act has a right to say that the narrative represents Samson as "inspired by no serious religious or patriotic purpose," and acting "only from personal motives of revenge;" if he was like other men, he is likely to have been under the influence of both sets of motives. Doubtless, however, the serious aspects of his character are less fully brought out than they would have been had the narrator given us fuller accounts of what he did as judge.

The most common traditional opinions make Samson a contemporary of Eli. The author of the article in the BRITANNICA is in accord with this when he says that the narrator "conceives of his life as a sort of prelude to the work of Saul (xiii. 5)." But this author rightly notices also that the affiliations of the narrative are decidedly with the times of Gideon, and that is equivalent to saying they are not with the times of Eli. We have seen that Samson is represented to have accomplished the deliverance promised through him, and this can hardly be reconciled with the idea of his living in the times of Eli. As he is said to have been judge of Israel, it is a somewhat violent device to limit his judgeship to some narrow locality, as those who defend the tra-

ditional view are obliged to do. On the whole it is more in accord with the evidence to regard the Philistine oppression, with which he was concerned, as that mentioned in Jud. x. 7, distinguishing it, on the one hand, from the earlier oppression of Jud. iii. 31 and x. 11, and, on the other, from the later oppressions of the times of Eli and Saul. See ISRAEL and SAMUEL. On this view the exploits of Samson, recorded in Jud. xiv.-xv., occurred while Jair the Gileadite was judge, a generation later than Gideon, and Samson's administration was followed by the eighteen years of oppression by the Ammonites.

As to the conjecture "that originally his Nazirite vow was conceived simply as a vow of revenge," it should be noticed that the Nazirite obligation, in Samson's case, is not said to have been of the nature of a vow taken by him, but of the nature of a command laid upon him. On the difference between the Nazirite for life and the Nazirite by vow, see VOWS and OATHS.

(W. J. B.)

SAMUEL. Doubtless the genealogies in 1

See Vol. XXI., p. 252 (p. 253 Am. Rep.).

Chronicles make this eminent judge of Israel a Levite, not, as the *BRITANNICA* states, "because a post-exile family of singers traced their stock from him," though that may have been the case, but simply because he was a Levite. The statement that in 1 Samuel "the story certainly implies that it was not by birth but only by his mother's vow that he was dedicated to the service of the sanctuary" needs modification. It may have been both by birth and by his mother's vow; the latter does not exclude the former, but rather presupposes it. His mother would not have made the vow unless she knew that he was by birth eligible to the service. On the supposition that only Levites were then eligible, the fact of her making the vow shows that the family was Levitical. That such was the case is borne out by all the evidence there is. There is nothing in the recorded history to prove that "at that early date the priesthood was by no means confined to the Levites," but much to prove the contrary.

The English Palestinian survey maps are doubtless correct in locating Arimathaea, that is the Ramathaim-Zophim of 1 Sam. i. 1, in the Ephraimite country, near Bethlehem-Judah. The author of the article on SAMUEL in the *ENCYCLOPEDIA BRITANNICA* is also correct in assuming that the Ramah of Samuel is the same with Ramathaim. It follows that the district of Zuph (the Zophim of the name Ramathaim-Zophim) was not of "the tribe of Ephraim," but of Judah, south of Benjamin, where it is correctly located, 1 Sam. ix. 5; x. 2, the location of the grave of Rachel being stated here as in Gen. xxxv. 19, 20, not "on the frontier between Ephraim and Benjamin," but south of Benjamin, near Bethlehem-Ephratah. The altering of the Hebrew text of 1 Sam. i. 1, either by dropping the word Ephraimite, or by changing it to Ephraimite, is needless and against the facts. There is no contradiction in saying that Elkanah was at once a Levite, an Ephraimite, and of the mountain country of Ephraim; and the account says that he was all three.

In regard to the work of Samuel as judge and prophet, see the following article and also ISRAEL and PROPHETS in this *Encyclopædia*.

SAMUEL, BOOKS OF. The statement made in the *ENCYCLOPEDIA BRITANNICA* that these books have been "freely handled by copyists down to a comparatively late date, as the variations between the Hebrew text and the Septuagint show," ought not to be accepted without verification, and it is a statement which it would be difficult really to verify. See SEPTUAGINT.

That the two books of Samuel anciently were

and still are, for certain purposes, counted as one book, and that the same thing is true of the two books of Kings, is indisputable; that for other purposes they are now counted as two books each, and have been so counted as far back as we can find information on the subject, is equally indisputable, though this fact is often ignored. There is no ground for arguing as if at some time the books of Samuel have been "divided from" those of Kings, or 1 Samuel divided from 2 Samuel.

That the books of Kings, though they continue the history from about the point where the books of Samuel leave it, are yet written from a different point of view, and constitute an entirely separate piece of composition, has been briefly shown in the article on KINGS. The literary affiliation that exists between the earlier chapters of 1 Kings and chapters ix.-xx. of 2 Samuel does not disprove this, for it may be accounted for by the fact that the author of Kings used materials from the same sources whence came these chapters of Samuel.

The books of Judges, Ruth, and Samuel, as they stand in the versions (in regard to the place of Ruth, see article on RUTH), form a continuous and unique work, whose analysis, within certain limits, is marked on the face of its contents. First come certain prefatory statements, of a rather miscellaneous character, Jud. i.-ii. 5. Second, we have a compacted history, Jud. ii. 6-xiii. 1, which begins by repeating several of the last verses of Joshua, then states the generic process of the history of the times of the judges, and then narrates the events up to the last year of Eli, the account which is begun in Jud. xiii. 1, being directly continued in 1 Sam. iv. 1b. *seq.* (For the chronology, see ISRAEL.) This section has full chronological data. Third, we have five stories, constructed on a common model, each complete in itself, and differing in literary character from the narratives of public history that precede and follow: the story of Samson, Jud. xiii. 2-xvi., the story of the capture of Laish by the Danites, xvii.-xviii., the story of the civil war with Benjamin, xix.-xxi., the story of Ruth, and the story of the birth and training of Samuel, 1 Sam. i.-iv. 1a. The five follow one another with no comment or interval. There is a sixth story of the same sort, the story of Saul and the asses, 1 Sam. ix.-x. 16. Each of the six begins with a certain formula, introducing the characters of the story, and this formula occurs nowhere else in this part of the Bible. Each of the six stories is complete in itself. Any one of them, or any number of them, or all of them might be removed without leaving any gap in the main narrative. This has actually been done with the story of Ruth, and might equally well be done with the others. The incidents recorded in the stories are omitted in the connected narratives that precede and follow. The stories themselves have chronological numbers only occasionally. The first three are grouped with the others at the cost of being removed from their proper chronological connection. Fourth, beginning with 1 Sam. iv. 1b, and omitting the story, ix.-x. 16, we have a series of narratives of the public history from the fortieth year of Eli (Jud. xiii. 1; 1 Sam. iv. 18), through the reign of David. For the reign of David these narratives are dated, 2 Sam. v. 4-5; ii. 10-11; xiii. 23, 38; xiv. 28; xv. 7; for the earlier period, the dates are incomplete, 1 Sam. vii. 2; xiii. 1; xxvii. 7. The narratives are arranged mainly in the order in which the events occurred, but, according to 1 Chron. xiii. 5, the events narrated in 2 Sam. vi.-vii. belong after those narrated in viii. and x.-xii., and although this testimony has commonly been ignored by scholars of all schools, we may yet, by accepting it, find a continuity in the history of David such as will otherwise be sought in vain. Further, viii. is a sequel to v., summarizing the events of David's

reign, up to the completion of his conquests, and x.-xii. is a different sequel to v., detailing certain specific events. And fifth, we have the six appendices found in 2 Sam. xxi.-xxiv.

As to the order in which these parts were written, it is natural to suppose that the prefatory sections in Jud. i., ii. 5, and the appendices, 2 Sam. xxi.-xxiv., were added after the rest of the book had been put together, though some parts of them may have been actually written earlier. There is no ground for the statement that "the appendix, 2 Sam. xxi.-xxiv., must have been added after the books of Kings had been separated from the context to which 1 Kings i., ii. originally belonged," for there is no proof that these books ever existed otherwise than separate, and consequently no proof that any separation was ever made. A perfectly natural account of the phenomena is that the appendices were added when the earlier historical series was collected, and that later, the compiler of Kings, when he entered upon his work, used an early narrative similar to those used by the compiler of Samuel. Two of the appendices, namely, 2 Sam. xxii. and xxiii. 1-7, are explicitly attributed to David, in the context, and there is no reason for minimizing this testimony into a mere expression of a late opinion on the subject.

It is probable that the narratives of David's reign and the continuous history in Jud. ii. 6-xiii. 1, with perhaps the continuation of that history in 1 Sam. iv. 1b-vii., the sections where the chronological data are full, were written later than the stories, and later than the narratives of the times of Samuel and Saul, where such data are lacking.

The account of the books of Samuel in the *ENCYCLOPÆDIA BRITANNICA* is largely made up of an attempt to discredit those sections of the books which cite from the Pentateuch, or allude to it; it represents these to be the work of a later narrator or redactor, and to be inconsistent with what are assumed to be the older and more trustworthy parts of the books. Largely, though not entirely, these alleged later sections correspond with the parts of the book that seem to be latest, by the analysis just given. But there is nothing to indicate that these later parts are very much later than the other parts, and there are no contradictions between them.

That "these two books, together with Judges, are made up of a series of extracts and abstracts from various sources," is partly true, as any one can see by reading the books with this question in mind. That they "have been worked over from time to time by successive editors" is a different proposition, and one which, in the nature of things, is incapable of proof. Given the original documents and a single editor, and the phenomena are as well accounted for as by any hypothesis of additional editors.

That "the main redaction of Judges and Kings has plainly been made under the influence of the ideas of the book of Deuteronomy," and that "the Deuteronomistic hand" is clearly recognizable in the books of Samuel is true, and it is therefore clear that Deuteronomy antedates all these books; but we need not infer the late date of Judges and Samuel in order to account for these facts; they are better accounted for by inferring the early date of Deuteronomy.

Since the song of Hannah, 1 Sam. ii. 1-10, and the prophecy, ii. 27-36, are incorporated into the story that occupies i.-iv. 1a, and not merely into the whole book of Samuel, the supposition that they are later insertions by some redactor of the book is less likely than that they are original materials, used by the writer of the story.

On the view that the narratives of the times of Saul were written earlier than those of the times of David and of the earlier judges, the most natural

explanation of 1 Sam. xiii. 1, is not that "one of the numbers has been left blank and the other has been falsely filled up by a mere error of the text," but that we have here an earlier use of the phrase "in his reigning" than that which prevails in the later writings. Later, the phrase is restricted to the meaning "when he began to reign," but here, as the King James' translators correctly held, it means that Saul was one year old in his new position as king, and that, at the beginning of his second year, he made the arrangements described in the next verse. The statement that "the similar note in 2 Sam. ii. 10, seems also to have been filled up at random; it contradicts and disturbs the context," is not well considered. There is here no contradiction with the context, but simply a presentation of the fact that although it was seven and a half years after Saul's death before David became king of all Israel, only two years of that time were occupied by the reign of Ishbosheth.

The assertion that "chapter vii. with . . . its account of a victory at Ebenezer . . . which delivered Israel from the Philistines all the days of Samuel, is inconsistent with the position of the Philistine power at the accession of Saul" is based on a careless idea, very commonly held, of the reign of Saul. This particular careless idea will be banished from the mind of any one who will take the trouble to observe that, if this account is in any sense historical, 1 Sam. xiii. 1, 2, must be regarded as a paragraph by itself in the history, the event mentioned in it being separated by an interval of a good many years from the events narrated in the following verses. In proof of this, notice that the accounts certainly make the impression that Saul, at his accession, was so young as to be immature; this being the case, the crown prince, Jonathan, was a little child when the arrangements of xiii. 2, were made. Saul placed one-third of his guard in charge of his home and his young heir, and with the other two-thirds established a military camp near by; but when the events of verse 3 take place Jonathan has become a warrior grown. It follows that the first recorded trace of Philistine invasion in the times of Saul was not at the beginning of his reign, but many years afterward. That Samuel's administration left the country with large resources, and free to concentrate them, appears from the numbers who gathered at Saul's first call for troops, 1 Sam. xi. 8.

The narrowness of the circuit of the four cities, 1 Sam. vii. 16, 17 (the circuit was not narrow if the Mizpah in it was the Mizpah east of Jordan), does not imply that Samuel's position was correspondingly narrow; it shows rather that his going from one city to another may have had some other object than that of bringing his court locally near to those who had business with it; the fact remains that he is said to have been judge of Israel, and not of any one region merely.

The great instance of alleged inconsistency in the statements of the books of Samuel is that of their accounts of David and Goliath. In regard to this see article DAVID. The other alleged unhistorical elements in these books are no more difficult to deal with than those which have been thus considered.

The article in the *ENCYCLOPÆDIA BRITANNICA* dates the books of Judges and Samuel, in their present shape, as later than the reform of King Josiah. Probably a majority opinion of living scholars would assign them to a date two or three centuries earlier than this, but later than the division of the kingdom under Rehoboam. The Jewish traditions say that the prophet Samuel wrote these books, and Gad and Nathan completed them. If this be understood to mean that Samuel personally wrote Judges and Ruth and the parts of Samuel that record events preceding his death, it is subject to grave objections. But if it be understood to mean that Samuel gave

the literary impulse that led to the production of the books, himself writing some of the stories and narratives; and that all the parts were written and collected before the death of Nathan, and by these three prophets, or under their influence, it is an opinion that cannot be successfully overthrown by evidence.

Decidedly in favor of this opinion is the testimony of 1 Chronicles, both in its use of the books of Samuel, 1 Chron. x.-xxi., and in its description of the sources of the history, xxix. 29. Note that for the history of David, Nathan is associated with Samuel and Gad, while for the history of Solomon, 2 Chron. ix. 29, he is associated with two later prophets. The likeness between parts of Samuel and the first chapter of Kings naturally connects itself with these two references to Nathan.

The principal argument brought against this view is the alleged existence in these books of allusions to events later than the reign of Solomon, but if any one will carefully examine the instances adduced, he will find them insufficient. The very strongest group of these instances is made up of the places where Judah is mentioned as distinct from Israel; but there is not one of these places where it is necessary to understand that the reference is to the divided kingdom, after the death of Solomon, and in most of the places it would be unnatural to understand this. The most extreme instance is in 1 Sam. xxvii. 6: "Ziklag pertaineth unto the kings of Judah unto this day," and this might apply to David and Solomon as well as to the later kings. They held Ziklag by a peculiar title, not in virtue of their being kings of all Israel but in virtue of their being kings of Judah. There are few instances or none where it would be necessary to resort to the hypothesis of a gloss in order to defend the view that these books were completed within the lifetime of Nathan. On the contrary, the absence of elements clearly later than Nathan's time is sufficiently marked to be a reason of positive weight in favor of this theory of the early origin of this group of books.

Many assertions to the contrary notwithstanding, the Biblical accounts certainly represent the times of Samuel, Gad, and Nathan to have been times of literary activity and times of historical research, that is to say times in which such a work as this might very naturally be produced; 1 Sam. x. 25; xxi. 13; ii. 1-10; 2 Sam. xi. 14, 15; xxii.; xxiii. 1-7; 1 Chron. xxvii. 24; xxiii. 27; 2 Chron. ii. 11, etc., and 2 Sam. xi. 20, 21; cf. Jud. ix. 53; 2 Sam. vii. 6, 8-11; viii. 16, 17; 1 Sam. ii. 27, 28; iv. 8; xii. 6-11, and many other passages.

Literature. For general use, the best English Commentary on Samuel is perhaps that in the *Cambridge Bible for Schools* series. That by Dr. R. Payne Smith, dean of Canterbury, in the *Pulpit Commentary*, is one of the best works in that series. The two volumes by Dr. W. G. Blaikie, in the *Expositor's Bible* (New York, 1888), are attracting attention. The work of Prof. August Klostermann on Samuel and Kings, in *Kurtzgefasster Kommentar*, edited by Strack and Zöckler (Nördlingen, 1887), is admirable. The books of Samuel are treated in the inductive Bible studies in the *Old Testament Student*, Sept. and Oct. 1887. Certain topics in the books are handled in Dr. R. S. Green's *Jonathan and Absalom* (Phila. 1887). (W. J. B.)

SAN ANTONIO, the county seat of Bexar co., Texas, is on the San Antonio River, 216 miles W. from Houston, on the Southern Pacific, and two other railroads. It has a county court-house, U. S. government building, opera-house, 6 hotels, 5 national banks, 6 other banks, 4 daily and 4 weekly newspapers, a large cathedral, 20 churches, and several schools. The city is lighted with gas, and has a large park. Its property is valued at \$16,300,000. It dates from 1673, and when a mission was founded on the opposite side of the river. The chapel afterwards became Fort Alamo, and was the scene of a massacre in the Texan war of independence. (See

ALAMO.) The city retains some picturesque features indicating its Spanish origin, but is rapidly assuming a modern American appearance. The present inhabitants are chiefly of American, German, and Spanish origin. Its population in 1880 was 20,550, but it has greatly increased.

SANDERSON, JOHN (1783-1844), author, was born at Carlisle, Pa., and studied law in Philadelphia, but was chiefly engaged in teaching. He warmly defended the study of the ancient classics. Of the *Lives of the Signers of the Declaration of Independence* (9 vols.) he wrote two volumes, the rest being prepared by his brother, J. M. Sanderson. A later edition, revised by Robert T. Conrad, was issued in 1865, and a centennial edition in 1876. Sanderson in 1835 was obliged to go Europe for his health, and wrote home some pleasant papers, which were gathered as *Sketches of Paris* (1838). Similar sketches of England were contributed to the *Knickerbocker Magazine*. After his return he was professor of Greek and Latin in the Philadelphia High School till his death, April 5, 1844.

SANDUSKY, a city and county seat of Erie co., Ohio, is on the south shore of Sandusky Bay 5 miles from Lake Erie, and 56 miles W. of Cleveland. It is in 41° 27' N. lat., and 82° 45' W. long. It is the Lake terminus of the Baltimore and Ohio, the Indiana, Bloomington, and Western, and the Lake Erie and Western Railroads, and is on the Lake Shore and Michigan Southern Railroad. The harbor is the best on Lake Erie, and admits to wharf the largest vessels used in lake commerce. In the season there are regular daily lines of steamers to Detroit and other lake ports. The average entries for the season, in recent years, have been coastwise, 1800; foreign, 375; clearances, coastwise, 1825; foreign, 300; tonnage, 380,000. The site of the city rises gradually from the shore, giving a beautiful view of the bay. It is on a limestone bed, which furnishes good material for building. It has a court-house, custom-house, 3 national banks, 22 churches, a public library, a high school, and 5 other school buildings, 3 daily and 6 weekly newspapers, one of these being German. It has several machine shops, car-works, manufactures of cutlery, hardware, wheels and wood-work. In the last it exceeds any other American city. It is the largest fresh-water fish market in the world, shipping 12,000 tons of fish annually. There is also large trade in lime, limestone, lumber, salt, coal, ice, grain, and fruits. About 1,200,000 gallons of native wine are shipped here annually. Erie county produces large crops of wheat, Indian corn, potatoes, and fruits. There are several noted summer resorts in the vicinity of Sandusky, such as Put-in-Bay, Lakeside, and Kelley's Island, and the city itself is so used. The population in 1880 was 15,838.

SAN FRANCISCO, the chief city of California, is on the end of a peninsula between the Pacific Ocean and the Bay of San Francisco. It is the chief seaport of the Pacific coast, having about 50 steamers running on regular lines to China, Japan, Honolulu, Australia, and South America. There are also numerous steamboats using the bay and its affluents. The public buildings comprise the city hall, commenced in 1871, and costing over \$4,000,000, the U. S. Mint, custom-house and other government buildings, the merchants' exchange, stock exchange, which cost \$900,000, house of correction, Masonic temple, and several theatres and opera houses. There are many stores and warehouses solidly built, and six or more stories in height. The industrial works comprise sugar refineries, woolen mills, flour mills, glass works, canneries, wire works, iron-ship works, and large establishments for making heavy machinery. There are also manufactories of clothing, shirts, shoes, and jewelry.

The city has an area of 42 square miles. The gas-works, which belong to private companies, are valued at \$6,625,000, and have a capacity for 4,000,000 cubic feet daily. The fire department comprises 15 engines, 1 fire boat, 8 hose carts, 5 hook and ladder trucks, and 325 men. The city has, however, suffered severely from fire. The fire of May 4, 1851, when the buildings of the city were chiefly of wood, caused a loss of several millions of dollars. On Aug. 21, 1886, there was a conflagration, the loss in which was estimated at \$1,000,000. The street railroads have about 35 miles used by horse cars and an almost equal amount on which cable cars are used. For education the city appropriates nearly \$900,000 annually. The total revenue is about \$3,750,000, and the yearly expenditure \$3,555,000. The city debt is \$1,457,000, and the rate of taxation 1.57 per cent.

The population in 1880 was 233,859, including 20,000 Chinese. It is now estimated to exceed 320,000, and the Chinese number about 25,000. The latter have six large Joss houses and many smaller ones. Besides the large and enterprising journals and periodicals in English, there are daily and weekly papers in French, Italian, German, Spanish, and Chinese.

SANITARY COMMISSION, the UNITED STATES, was created June 9, 1861, by an order of the secretary of war; its board, appointed by that officer and the United States Medical Bureau, consisted of H. W. Bellows, D.D., Professors A. D. Bache and Wolcott Gibbs, Drs. Jeffries Wyman, W. H. Van Buren, S. G. Howe, and R. C. Wood, U. S. A., with two army officers, G. W. Cullum and A. E. Shiras. This organization had been preceded by several of local and unofficial character, called forth by the intense interest felt by the people of the loyal States in the welfare of those who had gone forth to represent them in the field and to fight for the Union and human freedom. April 15, 1861, President Lincoln issued his call for 75,000 men; on that very day societies were formed by the women of Bridgeport, Conn., and Charlestown, Mass., to furnish aid and relief to the volunteer troops. Within a few days similar action was taken at Lowell, Mass., and Cleveland, O. The Women's Central Relief Associations of New York, organized at the Cooper Union, April 29, at a meeting called by ninety-one prominent ladies of the city, became the chief source whence the Sanitary Commission sprang. It presently sent to Washington a committee, consisting of Drs. Bellows, Van Buren, Harsen, and Harris, to consult with the War Department and the Medical Bureau, and secure, if possible, the appointment of a commission such as had rendered eminent services to the British army in the Crimean war. The government, fearful of lay intermeddling and collision with its officers, refused to grant similar powers without the consent of the Medical Bureau, which could not be obtained, and the commission when created had but a semi-official character, no authority, and the privileges merely of visiting the troops, consulting with the Bureau, and recommending sanitary regulations and reforms to the War Department. Not the active support of the government and its officers, but the warm sympathy of the people at home, enabled it to grow rapidly from feeble infancy to vigorous life, and to render those noble services which made its name blessed throughout the land.

It had many difficulties to contend with and overcome. The natural jealousy and suspicion of the surgeons and other officers proved beneficial, as affording the stimulus of criticism, and holding the employes of the Commission to a strict account. The lack of any general appreciation of the dangers of camp diseases, and the inability of the public mind to enter into the main object of the Commission,

which was prevention rather than cure, were embarrassing. The first volunteers were very young, more than half under twenty-four, and many mere boys. Their parents, sisters, and friends had a vague but strong feeling that they ought to be supplied with comforts in the way of food and clothing, beyond what the government provided; and this, with ministrations to the sick and wounded, was popularly supposed, throughout the war, to be the main work of the Commission; but its leaders held far wider views. Few things in modern history are more creditable than their management of the vast interests doubtfully and grudgingly committed to their care, combining as it does statesmanlike foresight, careful prudence, and rigid integrity, with humane and patriotic zeal. Its officers deserve an honorable place in American remembrance. Dr. H. W. Bellows, of New York, was president and the soul of the organization; A. D. Bache, LL.D., of Washington, vice-president; G. T. Strong, of New York, treasurer; Drs. Van Buren, Agnew, and Gibbs the medical committee. The general secretaryship at Washington was held most efficiently by F. L. Olmsted, 1861-3, Dr. J. F. Jenkins, 1863-5, and J. S. Blatchford, 1865. Prof. J. S. Newberry, as Western secretary at Louisville, was equally energetic; these gentlemen, in charge of the two great depots of supplies and distribution, ably discharged a heavy responsibility. To the original board were soon added, besides those just named, Dr. Elisha Harris, Bishop T. M. Clark, of Rhode Island, Horace Binney, of Philadelphia, and several others. The board held twenty-three lengthened sessions at Washington, and during the intervals a standing committee, composed of Drs. Bellows, Van Buren, Gibbs, and Agnew, with Mr. Strong, and afterward C. J. Stillé, met almost every day in New York. None of these officers received pay, except those who gave their whole time to the work; but it was soon found better and cheaper to employ salaried persons in the field, thus establishing a system of accountability, discipline, and promotion; volunteer help was then accepted only as supplemental in special cases. Method and subordination were necessary to success, and won the tardy respect of the medical and military officers of the government.

The finances of the Commission were for over a year very limited, money coming in much less freely than goods. June 21, 1861, aid was asked from the people and from the life insurance companies. By Sept. 1 only \$13,630 had been received, and by Mar. 28, 1862, but \$53,720. Under these discouraging circumstances, only the faith and zeal of its leaders prevented its dissolution. By Sept. 10, 1862, the amount had reached \$158,501, chiefly from New York, Philadelphia, and Boston, and the embarrassments were great. But within the next twenty-three days California had sent two contributions of \$100,000 each. This was the beginning of a new era; the services of the Commission began to be appreciated, and money to flow in more freely. Considerable sums came from Buenos Ayres, the Sandwich Islands, and branches in London and Paris. The famous "Sanitary Fairs," held early in 1864, reached the popular purse; that of New York yielded \$1,184,487; Philadelphia, \$1,035,398; Brooklyn, \$305,513, while smaller amounts came from Albany, Boston, and other cities. Of all the contributions to Jan. 1, 1866, that of California was the greatest, \$1,233,977; New York followed with \$229,328; Massachusetts with nearly \$122,000; Nevada with \$107,642, and Oregon with \$79,406. The total of cash receipts was \$4,924,480; and at least \$2,000,000 more was raised and expended by the branches. The estimated value of goods was \$15,000,000.

These gifts—provisions, drinkables, dry goods of all sorts—came from every part of the land; from

cities, villages, and farms, often bearing the marks of loving self-denial. The cost of their transportation was diminished full two-thirds by the generosity of railroad and express companies, whose services (as also those of the telegraph lines) were in most cases gratuitous. Depots of supplies were established Sept. 5, 1861, at Boston, New York, Philadelphia, Washington, Cincinnati, and Wheeling; central aid associations had previously been formed also at Columbus, Cleveland, Chicago, and elsewhere in the West. The boxes sent to these places were opened, their contents sorted, recorded, and sent where they were needed. The Commission received nothing meant for any particular person or place, and recognized no distinctions of State or regiment, but aimed to minister to all soldiers of the Union alike. The government was unable to provide adequately for the sick and wounded; the efforts of affection or charity in the North, whether individual or local, to send help to the camps and battle-fields were perforce in large measure confused and futile; the Commission, with its carefully devised system, its admirable administration, and its army of earnest and disciplined employes, stepped in as an intermediary, and distributed the loving bounty of those at home to their defenders throughout the South.

The relief bestowed was of two classes, general and special. An inspector and staff of agents, with four-horse wagons or steamboats loaded with supplies, were usually attached to each army corps and to each expeditionary force. The inspector (always a physician) visited the hospitals, was in frequent conference with the surgeons, and on their demand furnished from his stores food, clothing, wines, medicines, etc. So far as was possible, battles were anticipated and provided for; at 600 out of 700 during the war, the agents and stores of the Commission were present. After Antietam, *e. g.*, it cared for near 10,000 wounded during four days, in which no government supplies were accessible. An auxiliary relief corps, some 150 members, was organized in May, 1864, to minister to the wounded left in hospitals when the army continued its march. Feeding-stations on the route of the ambulances was part of its work. Among those who fell in this dangerous service were the wife of Gen. Barlow and Prof. Hadley, of Union Theological Seminary in New York.

The Special Relief Service was intended mainly for the sick of new regiments, and for soldiers discharged or dismissed from hospitals; the latter were aided on their way home, protected from sharpers and from their own weaknesses, and their arrears of pay collected for them. Forty homes and lodges were established and sustained throughout the land, from Boston to Brownsville, Texas. Over one million nights' lodgings, and nearly five million meals, were thus supplied, and \$2,500,000 of pay obtained. A pension bureau and war claim agency was founded, which after the war took charge of some 57,000 claims, and collected \$7,500,000 gratuitously. A convalescent camp near Alexandria, Va., long directed by Miss Bradley, rendered various services to very many. The special relief service was organized and controlled by Rev. F. N. Knapp.

But these labors, however useful to the soldiers, and however effective with the popular mind, were not the only work of the Commission, nor, in the view of its leaders, the most important part thereof. They never lost sight of the ideas conveyed by their title, "Sanitary." Had they loudly proclaimed the scientific and far-reaching nature of their views, and confined themselves to the effort to prevent rather than to assuage suffering, they would have lacked popular sympathy and support. Brain bore as large a part in their work as heart and hand. Nothing that they did received more praise than

the *Hospital Directory*, which aimed to keep and follow up the record of the sick or wounded. A central office at Washington was opened Nov. 27, 1862, and branches followed at Philadelphia, Louisville, and New York. Agents took the names of the wounded after every battle, and 233 general hospitals sent frequent reports; thus a list of over 600,000 was kept, with the latest facts known as to each. The worst horror of war to those at home was the frequent uncertainty as to the fate of relatives or friends; in such cases inquiries after the missing were prosecuted, and the facts learned in seven out of every ten cases. The archives of the Commission, preserved in the Astor Library, include a large row of folios of this *Directory*.

The *Bureau of Vital Statistics*, inaugurated by Secretary Olmsted, and carried on by Dr. B. A. Gould, did work of great scientific value and repute, embodying inspections of some 870 regiments, and tabulating statistics concerning "the effects of applied or neglected hygiene, of diet, of long marching and heavy equipment, of tent and fixed hospitals; the mortality of young recruits; the influence of climate, drill, nationality, of previous occupations, or state of education upon soldiers; the height, weight, strength, and force of the enlisted men," and other matters bearing upon life insurance, anthropology, etc. This the president of the Commission considered "one of the most creditable and faithful portions" of its work. Mr. Olmsted's report of the statistics of the battle of Bull Run, in the beginning of these collections, was "the first scientific attempt to generalize the causes of our disaster."

In ways more immediately affecting the physical welfare of the soldiers, the Commission by no means confined itself to the supply of food and clothing. A corps of sixty well-known medical men was organized under Dr. H. G. Clark, of Boston, to visit and inspect the general hospitals throughout the land, and report to the medical committee. These reports by May, 1863, covered 2500 folio pages, and on their basis suggestions were made to the surgeon-general for improvements in the hospital system, which thus reached a degree of excellence nowhere attained before, and unhappily not kept up in the United States since the war. The Medical Bureau also was closely watched from an early period, with a view of weeding out ignorance and incompetency. In this task much jealousy and opposition was aroused, and the existence of the Commission was for a time endangered; but a reform was at length accomplished, disorders and deficiencies in the main removed, and a system of promotion for services and merit substituted for that under the old rule by mere seniority.

The inventions of the Commission were of great benefit in assuaging suffering and saving life. The pavilion hospitals, built from its models, and intended to minimize the dangers of contagion and pestilence, were widely adopted. Its hospital cars and steamboats aimed to lessen the horrors attending the transportation of the sick and wounded by land and water with merely the ordinary government facilities. After the capture of Fort Donelson several States attempted to transport their own men, and yielded this service reluctantly to the Commission, whose organization was more complete and its facilities greater. Its steamers, provided with surgeons, nurses, and all necessities, carried multitudes of sick and wounded men from the posts adjacent to camp or battle-field to the nearest hospitals. The hospital car, devised by Dr. E. Harris, of New York, was hung on gutta-percha springs to prevent jolting, and turned the stretchers on which the wounded were borne into hanging beds; supplied with comforts and attendance it did much to diminish for the wounded the torments of travel by the common modes of conveyance.

In fighting against scurvy, which attacked the armies of the Tennessee and the Cumberland in 1863, the Commission found a congenial field for its beneficent energies. An appeal to the farmers of the Northwest brought within a month 15,000 bushels of vegetables, when the government had been able to procure none. Hospital gardens were soon established at Murfreesboro, Nashville, Chattanooga, and Knoxville, Tenn., and at Newberne, N. C.; these proved of great value as producing a supply near the points where it was needed. Grant's forces at Vicksburg received vast quantities of supplies from Louisville by the zeal of Drs. Newberry and Warriner, and the health of the troops was largely improved thereby. After the fall of Vicksburg various branches of the Commission in the Northwest were active in sending boat-loads of stores. The hospitals along the Mississippi were supplied from Cairo by the steamer Dunleith. While the army was blockaded at Chattanooga, the Confederates took seventeen wagons of the Sanitary train in the Sequatchie Valley; but seven succeeded in reaching their destination, and the loads of these, and of three which arrived later, furnished the chief supplies of the hospitals for some time. A depot was established at Stevenson, Tenn., and a feeding-station on the route of the ambulances half-way between that point and Chattanooga. During the winter of 1863-4 the ordinary food of the troops brought on attacks of scurvy and chronic diarrhoea, which the Commission combated by means of its gardens and of contributions from the North. In January, 1864, the depot at Nashville sent out 3423 bushels of potatoes and 157 of onions, 8742 gallons of sauer-kraut and 1969 of pickles, with 13,662 lbs. of dried fruit, and other articles. The dissemination of these anti-scorbutics did much to diminish illness and keep our forces up to their work. The vegetables distributed in seven months of 1864 reached an estimated value of over \$66,000. Burnside's men at Knoxville were likewise cared for. Sherman's march to the sea was anticipated with 3000 barrels of vegetables and quantities of condensed milk, stimulants, beef, bandages, etc., and followed by 24 wagon-loads of stores. The 300 temporary hospitals along the route were all visited by agents of the Commission, and 17,000 meals were given at feeding stations in the rear.

This sanitary work in the Western armies received much more favor and aid from the military officers, high and low, than did the corresponding labors in the East. The army of the Potomac was better supplied, but the help of the Commission was welcome in frequent emergencies. After Fredericksburg a relief station, opened at Aquia Creek, cared for 600 men the first night. After Chancellorsville both the regular and the sanitary supplies were intercepted. Immense preparations were made for the battle of Gettysburg, and great services rendered. Competent agents, stationed at convenient points in Maryland and Pennsylvania, were in constant communication with those who accompanied the army on its march, and whose wagons were kept supplied from Washington; during the battle these were filled and returned from Fredericksburg, and much help given to the field hospitals. Two of the leading agents were caught by the enemy's cavalry, taken to Libby Prison, and there confined for some months: the Confederates rarely spared the Commission, though their wounded prisoners were cared for like Union soldiers. In the long list of articles distributed during ten days after the battle, some of the items are 11,000 lbs. of poultry and mutton, 6430 lbs. of butter, 20,000 lbs. of ice, 12,900 loaves, 8500 dozen eggs, 12,500 lbs. condensed milk, 3800 lbs. beef-soup, 7000 lbs. farinaceous food, 6800 lbs. white sugar, over 7500 drawers, over 19,000 shirts, nearly 5000 pairs socks, 16,000 towels and napkins, 7000

tin basins and cups, 2300 sponges, 1500 combs, 250 lbs. castile soap, 300 yards oil silk, and 3500 fans. In this humane activity nothing seems to have been overlooked, every need and comfort anticipated.

In the battles of the Wilderness 200 relief agents were busy with the wounded, and 200 tons of stores conveyed by two steamboats, two barges, and 44 wagons. In two months \$515,000 were received and expended for the army in Virginia. Malaria was resisted on the lower coast, and the health of the troops before Charleston fortified. At Fort Wagner the troops saluted the Sanitary flag, in recognition of benefits derived from supplies of ice and anti-scorbutics. At Olustee, Fla., the government had made no adequate provision of medical supplies, and the Commission filled the gap. At Newberne and Beaufort all the agents except Dr. Page, the inspector, were attacked by yellow fever, but he and Dr. Hand, the medical director, battled successfully with the pestilence. Drs. Crane and Blake rendered great services at New Orleans, and distributed far and wide the supplies sent down the river by Dr. Newberry. Messrs. Ingram and Root were visitors in the hospitals at Nashville, through which 100,000 men passed in six months.

The agents of the Commission were themselves exposed to the evils they sought to counteract or mitigate, to the direct or indirect perils of war, to contagion, hardship, exposure, and often to capture, wounds, or death on the field of battle. Their faithful humanity and patriotic devotion in ministering to the comfort, health, and life of the defenders of the nation shall not be forgotten. By their means thousands who might also have filled unknown graves were restored to home and friends, and multitudes enabled longer to serve their country in the field. In nothing does our Christian civilization contrast more happily with the brutality and indifference of former times than in its efforts to mitigate the horrors and assuage the sufferings of war; and of these noble endeavors none have been more illustrious than those of the United States Sanitary Commission.

Its voluminous archives are preserved in the Astor Library, New York. Many of its reports possess historical and scientific value. Its official *History* has been written (1866) by Dr. Charles J. Stillé, LL.D., afterwards provost of the University of Pennsylvania, and more briefly by its president, Dr. Bellows, in Johnson's *Cyclopædia*. See also Katharine P. Wormley's *The Other Side of the War* (1888), and Gen. P. R. De Trobriand's *Four Years with the Army of the Potomac* (1888). For the work of its kindred association, The U. S. Christian Commission, see that title. (F. M. B.)

SANITARY SCIENCE is a knowledge of the laws for the preservation of health, and practical hygiene is the art of so applying those laws as will best attain that end. This art has been practised from time immemorial: the ancients worshipped at the shrine of the goddess Hygieia, the alchemists sought for the "elixir of life," Moses gave to the Jews a hygienic code, and Hippocrates, the father of medicine, summed up the knowledge of his day in the following six articles: "Air, aliment, exercise and rest, sleep and wakefulness, repletion and evacuation, the passions and affections of the mind." But in more modern times the study of physiology and pathology opened new fields of research, and as knowledge was gained of the functions of the various organs of the human economy, the scientific investigation of the laws for the preservation of health was made possible. In still later years chemistry and microscopy have greatly added to this knowledge, until now we have a more thorough understanding, not only of the laws which govern the life and health of the individual, but also of the invisible yet potent agencies which cause

pathological changes resulting in wide-spread disease and death.

Scientific investigation into the means for preserving health in the United States is of quite recent growth, although fragmentary laws for the prevention of the introduction from foreign ports of contagious and infectious diseases were early enacted by the colonies. The colony of Massachusetts Bay, in 1648, through the general court, passed quarantine laws "for the prevention of a disease [yellow fever] so fatal in its character as was then prevailing in the Barbadoes and other islands in the West Indies." The province of South Carolina in 1698 enacted a law that "All vessels are forbidden to pass to the east of Sullivan's Island one mile, without permission of the governor, under penalty of being fired on by the gunner and paying a fine. The pilot is required to ascertain from the captain, before passing that limit, if any contagious disorders are on board, under penalty of £50." Pennsylvania in 1699, Rhode Island in 1711, New Hampshire in 1714, and New York in 1755 enacted quarantine laws to prevent the foreign importation of disease. Similar laws were enacted by seaboard States or municipalities after the Union was formed, and stimulated by the great yellow fever epidemic of 1793-5 the question of governmental control of quarantine was largely discussed in the fourth Congress (1796). The precedent set by the Congress of that day has been followed (after similar discussions) ever since, viz: The civil and military officers of the government are only empowered to aid in the execution of the health and quarantine laws of the several States. (Sec. 4792, Revised Statutes.) The ravages of yellow fever in 1817, at New Orleans, led the city and State authorities to enact very stringent quarantine laws in that year, but the recurrence of the disease the year following resulted, because of their inadequacy, in a "repeal of the laws for the prevention of the introduction of pestilential, malignant, or infectious diseases," directed the sale of the lazaretto and all its property and invested the governor with authority to establish quarantine at his discretion. Time and again the quarantine laws were re-enacted and repealed, until 1855 the present law was established and the detention, fumigating, and cleansing of vessels required. Since 1884 the plan adopted for maritime sanitation has been greatly improved upon—machinery being substituted for manual labor—and a steam tug is now used for forcing sulphurous acid gas into every part of a vessel's hold; this is followed by sprinkling and cleansing the decks, etc., with a solution of bichloride of mercury through hose connected with the steam engine, so that the detention of vessels at New Orleans may now be expressed in hours instead of days. (See FUMIGATION.)

During the first half of the present century no united effort was made in this country to prevent the occurrence or spread of disease, although individuals here and there discussed the subject of "preventive medicine," and tried to obtain recognition of the great principle that "prevention" was more scientific than "curing" disease. The questionable efficacy of quarantine was being agitated abroad, and the action of the first International Sanitary Convention, held in Paris in 1850, where the chief feature of the convention was the abrogation of useless quarantine restrictions and inculcating municipal hygiene in their stead, had a great effect upon the thoughtful minds of this country. Delegates from France, England, Austria, Spain, the two Sicilies, the Roman States, Greece, Russia, Portugal, Sardinia, Tuscany, and Turkey were present at this convention, their interest in which led to subsequent international congresses. Sanitary reform had also begun in England. The ancient fallacies of quarantine (forty days' detention) were attacked,

and internal sanitary measures, recommending destruction of fomites and all sources of infection in town or country, and the sanitary inspection of habitations substituted. The result of these public discussions of the inadequacy of quarantine restrictions alone, and the beneficial effects of sanitary measures, led the American Medical Association (instituted in 1847) to appoint a committee to investigate the sanitary condition of large cities. About this same time (1850) the legislature of Massachusetts printed a *Report of a General Plan for the Promotion of Public and Personal Health*, which had been prepared by a committee appointed for that purpose. This report was prepared with great care by Samuel Shattuck, a layman, and was filled with details relating to sanitary measures necessary for the prevention of disease; it also recommended the establishment of a State Board of Health with powers to effect the reforms so fully set forth. That report is bearing fruit after many years, and foreshadowed much that is now accepted as hygienic truth. After the great yellow fever epidemic of 1853 the New Orleans Board of Health appointed a commission with special instructions:

1. To inquire into the origin and mode of transmission of the late epidemic of yellow fever.
2. To inquire into the subject of sewerage and common drains, their adaptability to the situation of our city and their influence on health.
3. To inquire into the subject of quarantine, its uses and applicability here, and its influence in protecting the city from epidemic and contagious maladies, and,
4. To make a thorough examination into the sanitary condition of the city, into all causes influencing it in present and previous years, and to suggest the requisite sanitary measures to remove or prevent them, and to the causes of yellow fever in ports and other localities having intercommunication with New Orleans."

Circulars were issued by the commission to all parts of the country where yellow fever occurs, and the committee sat as a "court of inquiry" for three months gathering information far and wide, and stating that "prevention of an epidemic was the basis of the work to be done." The conclusions arrived at by the commission were that a combination of terrene and meteorological conditions was absolutely essential for the development of an epidemic, (heat and moisture combined with filth,) that policing is the remedy, that "sanitary reform is the talisman" and "hygiene the science of life," and recommended a thorough sanitary survey of the city, including every house, lot, and back-yard; every cause of disease should be abated, vaccination looked after, and a record of inspection kept of every square in the city, and finally the commission prepared an ordinance for establishing a health department for New Orleans "with ample powers to effect the reform suggested."

The first "Quarantine (sanitary) Congress" in the United States was held in Philadelphia May 13, 1857, called together by the Board of Health of Philadelphia, for the purpose of establishing a uniform system of quarantine in the maritime cities. Its members were not confined to the medical profession; commercial and municipal departments were invited and no less than 26 different authorities from nine Atlantic States were represented by 73 delegates; a three days' session was held in which the question of making uniform the quarantine regulations of the several States was fully discussed and 23 propositions were laid down in regard to quarantine. A permanent organization was effected and the congress adjourned to meet in Baltimore, April 29, 1858. The name of the congress was changed to "The Quarantine and Sanitary Convention." Twelve States represented by 86 delegates were present at the second meeting. Two committees were appointed—one on "external hygiene or quarantine" and the other on the "sanitary arrange-

ment of cities." Third meeting of the convention was held in New York, April 27-30, 1859, at which the report of the committees appointed at the second meeting was discussed. The fourth meeting of the convention was held in Boston, June 14-16, 1860, at which sanitary science, "State medicine," quarantine and the management of epidemics, vaccination, vital registration, etc., were discussed, and cleanliness of cities declared to be more important than quarantines. The efficacy of steam as a purifier and preventive was here first suggested. The next meeting was appointed for May, 1861, at Cincinnati, but the civil war intervening caused it to be abandoned. In May, 1861, three associations of New York (the Woman's Central Association for the relief of the sick and wounded of the army, the Advisory Committee of the Board of Physicians and Surgeons of the hospital of New York, and the New York Medical Association for furnishing hospital supplies in aid of the army) proposed to the secretary of war the "Sanitary Commission" with the "object of bringing to bear upon the health, comfort and morale of our troops the fullest and ripest teachings of sanitary science," to inquire into the subject of diet, cooking, cooks, tents, company grounds, transports, and everything pertaining to outfits, etc.; cleanliness, precautions against dampness, cold, heat, malaria, infections, crude or ill cooked food, etc." The commission was ordered by the secretary of war, approved by the President, June 9, 1861, and organized June 13, 1861. (See SANITARY COMMISSION.) Similar organizations also existed in the South during the war.

In 1866 a great stride was made in municipal health legislation by the establishment in New York City of the Metropolitan Health Board; an organization modelled after the English Sanitary Act, with ample powers to make such reforms as would secure the health of the people. Its first practical work was an apparently successful contest with the Asiatic cholera, which occurred that year, thereby allaying apprehension at the time, if not for the future. Town or city boards of health (generally for quarantine purposes) had existed for many years in the large maritime cities, and more or less effort was made to suppress nuisances, obtain vital statistics, etc., but no State board of health was created till Massachusetts, in 1869, took the lead followed by California and Virginia, 1871; Minnesota, 1872; Louisiana and Michigan, 1873; Alabama, Georgia, and Maryland, 1875; Colorado, New Jersey, and Wisconsin, 1876; Illinois, Mississippi, and Tennessee, 1877; Connecticut, Kentucky, Rhode Island, and South Carolina, 1878; Delaware and North Carolina, 1879; Iowa and New York, 1880; Arkansas, Indiana, New Hampshire, and West Virginia, 1881; Texas, 1882; Missouri, 1883; Kansas, Maine, and Pennsylvania, 1885; Ohio, 1886; Vermont, 1888. Several of the earlier boards have been reorganized and made more efficient. A board of health for the District of Columbia was authorized by Congress in 1871.

The public agitation of the preservation of health by hygienic measures, and the interest taken in the subject by those in authority, led to the organization of the American Public Health Association in 1872, whose object as stated by its constitution "shall be the advancement of Sanitary Science and the promotion of organizations and measures for the practical application of public hygiene," and its "members shall be selected with special reference to their acknowledged interest in, or devotion to, sanitary studies and allied sciences, and to the practical application of the same." After its third annual meeting its success was assured, and its influence has marked the progress of sanitary work beyond the most sanguine hopes of its projectors. Its membership numbers over 1000, comprising

many of the brightest minds in sanitary work—doctors, lawyers, editors, executive officers of cities and towns, sanitary engineers, sanitary plumbers, and house-builders, etc. Its reports and papers are teeming with information of the most valuable and varied character, and its annual meetings continue, as from the first, to stimulate the formation of boards of health, sanitary associations, and publications diffusing useful knowledge throughout the country. One of its members, Mr. Henry Lomb, of Rochester, New York, has for several years past given prizes aggregating some \$1500 for the best essays upon sanitary subjects, such as "Healthy Homes and Foods for the Working Classes," "The sanitary conditions and necessities of school-houses and school life," "The preventable causes of disease, injury, and death in American manufactories and workshops, and the best means and appliances for preventing and avoiding them," etc.

In 1875 the disinfection of houses and premises by means of carbolic acid spray or steam atomizer, and of streets by cart-tank and sprinkler, was practised in New Orleans. Ship's holds were disinfected by means of burning brimstone and a blower (similar to a blast furnace) forcing the sulphurous gas into every part of the vessel. At New York City the sanitary inspection and disinfection of vessels and care of the sick arriving in them had long been substituted for detention or "quarantine." In 1876, during the "Centennial International Medical Congress," held in Philadelphia, hygiene was somewhat discussed, but no great progress was made in popularizing sanitary work, though the "general subject of quarantine, with particular reference to cholera and yellow fever," was presented in an address by Surgeon General John M. Woodworth, of the Marine Hospital Service, who in conclusion submitted six propositions for the consideration of the section on sanitary science, which, after a lengthy discussion, were adopted, as follows:

I. The supervision of ocean travel ought to be directed to securing good sanitary conditions for vessels at all times out of as well as in port.

II. A system of port-sanitation should be adopted and administered for each country or place, separately, and should be modified in particular cases by taking into account the liability of the port to infection, the period of incubation of the disease, the length of time consumed in the voyage, the measures enforced by the vessel *en route*.

III. In some countries the detention of passengers and crews of ships hailing from infected ports is warranted, but for such time only as is necessary to complete the period of incubation of cholera or of yellow fever, counting from the date of departure from an infected port, or of landing from an infected vessel; in no instance should passengers or sailors be held for observation on board an infected vessel, and such vessel should not be detained beyond the period required for inspection, and for thorough disinfection and cleansing.

IV. Recognizing the fact that the morbid causes of infectious diseases may sometimes elude the most vigilant sanitary supervision of shipping, the importance of wisely directed internal sanitary measures can scarcely be overestimated.

V. As far as America is concerned, it is desirable that prompt and authoritative information should be had of the shipment of passengers or goods from districts infected with cholera or yellow fever, thereby insuring the thorough disinfection of infected articles.

VI. The endemic homes of cholera and yellow fever are the fields which give the greatest promise of satisfactory results to well-directed and energetic sanitary measures; and to this end an international sentiment should be awakened, so strong as to compel the careless and offending people to employ rational means of prevention.

These propositions, submitted twelve years ago, are the basis upon which sanitarians are now working to advance sanitary science at home and abroad.

At this congress the subject of "germ disease" was considered in an address by Dr. Thos. E. Satterthwaite, of New York, who stated that there were three theories: (1) The vegetable-germ theory;

(2) That disease-germs were degraded parts of animal tissue which divided and subdivided "as live matter alone divides." (3) The physico-chemical theory. He explained these different theories at length, and stated that attention was first called to the "cholera-fungus" in 1849; that Hallier and others described the "cholera micrococcus," in 1867, as a granular mass which underwent a variety of changes in form, but that no agreement had been reached by investigators as to the specific form, and that experiments made by himself in 1873 failed to find microscopic changes in molecular matter. He then submitted the following "conclusions:":

I. As far as inquiry has been made as to the nature of the active principle in infective diseases it is probable that in a certain number the matter is particulate or molecular in form.

II. That in regard to the causes of septicæmia, pyæmia, puerperal fever, erysipelas, and hospital gangrene, and those of cholera, vaccinia diseases, the carbuncular diseases of men and animals, typhoid and relapsing fevers and diphtheria, there is not satisfactory proof that they are necessarily connected with minute vegetable organism.

III. That the real nature of these causes is still uncertain.

Dr. John L. Atlee, in a report on the cholera epidemic of 1854, made the following year to the sanitary committee of Lancaster County, Pa., states that microscopical examinations of the rice-water discharges from both the stomach and bowels disclosed *minute bodies* differing in appearance from epithelial cells, and from known physiological and pathological, histogenic, and phylogenetic elements. (*Transactions of the Medical Society of the State of Pennsylvania*, 1855, vol. v. p. 108.) He is reported to have lately said (1888) that these "minute bodies" are identical with the now well-known comma-bacilli of Koch, but that he does not believe they are the cause of cholera, and "so far, no convincing proof of the germ theory of disease, as applied to living tissues and living phenomena has been produced." (*Annals of Hygiene*, Aug. 1888, p. 310.)

The progress of sanitary science in the United States was again stimulated and advanced as a result of the ravages of yellow fever in Memphis, Tenn., in 1878-79. Many bills were introduced in Congress at that time with a view to preventing future epidemics by national sanitary legislation, and on April 29, 1878, "An Act to prevent the introduction of contagious or infectious diseases in the United States" became a law. It provided that no vessel coming from a foreign port where contagious or infectious disease may exist, or carrying persons, merchandise, or animals affected with such disease, shall enter any port of the United States, contrary to the quarantine of such State, except in the manner to be prescribed by regulations; required consular officers or other agents of the government to immediately notify the surgeon-general of the Marine Hospital Service of the departure of such vessel from an infected port, and also notify the health officer at port of destination; required consular officers to make weekly reports of the sanitary condition of their respective ports. Rules and regulations were to be framed by the surgeon-general, and when approved by the President, medical officers of the Marine Hospital Service and custom officers were directed to aid in enforcing the same. Weekly abstracts were to be made by the surgeon-general of consular sanitary reports and other pertinent information received by him. It provided further, that officers or agents of State or municipal quarantine systems, on application, may be authorized to act as officers or agents of the national quarantine system. No appropriation was made by Congress to carry out the provisions of the law, though a *Public Health Bulletin* containing a weekly abstract of consular reports was published by the Marine Hospital Service in accordance therewith.

On March 3, 1879, after much public discussion and outside pressure, Congress created a National Board of Health. The Board was composed of seven members appointed by the President, and confirmed by the Senate, and one medical officer each of the Army, Navy, and Marine Hospital Service, and one officer from the Department of Justice. As defined by the law its duties "shall be to obtain information upon all matters affecting the public health, to advise the several departments of the government, the executives of the several States, and the commissioners of the District of Columbia on all questions submitted by them or whenever, in the opinion of the Board, such advice may tend to the preservation and improvement of the public health." It also directed that the Board, with the assistance of the Academy of Science, shall prepare a plan for a national public health organization after consultation with the principal sanitary organizations and sanitarians of the several States, special attention to be given to the subject of quarantine, both maritime and inland, and as to the regulations which should be established between State or local systems of quarantine and a national quarantine system, and appropriated \$50,000 to carry out the purposes of the act. An additional act was passed and approved June 2, 1879, temporarily suspending the act of April 29, 1878, and enlarging the duties of the National Board of Health to cover the provisions of that act. The Board having organized, at once commenced investigations into the causes of disease, into the sanitary condition of cities, etc., prepared rules and regulations to be observed in case of epidemics, established refuge stations at the following points: Ship Island, Gulf of Mexico, Sapelo Sound, Ga., Norfolk, Va.; appointed a commission to visit Havana, and investigate yellow fever in Cuba; secured the presence of an International Sanitary Conference in Washington in 1881, and stimulated the formation of State Boards of Health. It employed sanitarians and experts in various investigations, and made many valuable contributions to sanitary science. (See *Reports National Board of Health*, Vols. I.-V., 1879-83.) The law creating the Board is still on the statute book, but the act of June 2, 1879, having expired by limitation in 1884, and no appropriation having been made for its maintenance, it is now a board only in name. By the expiration of said law, that of April 29, 1878, was revived, and is now in active operation, having been recently perfected (Aug. 1, 1888) by additional legislation establishing national quarantine stations at the following points: Chantelaur Island, Gulf of Mexico, near Key West, coast of Georgia, entrance Chesapeake Bay, mouth Delaware Bay, San Diego, Cal., San Francisco, Port Townsend, Oregon. It is made a misdemeanor punishable by fine or imprisonment, or both for the master, pilot, or owner of any vessel entering a port of the United States in violation of the act or regulations framed under it.

This chronological history of the progress in sanitary science in the United States has been necessarily very brief, and it will be observed that "quarantine" (which as now conducted is a sanitary institution) has been included. At the present time, and for ten years past, the "germ theory of disease" has commanded much scientific attention, and given to the subject of sanitary science an exhaustless field for research and speculation. (See BACTERIA and GERM THEORY.) It may here be stated that the theory is that a living germ, microscopical in size and of almost infinite self-multiplication, invades the human organism and by its presence gives rise to pathological changes, resulting in different manifestations of disease depending on the species that is migrating—to the alimentary canal (especially the intestines) in cholera, to the lungs in

tubercle, etc. It is not generally believed that this germ arises *de novo*, but that it is transmitted from person to person through the medium of air, food, or water, and finds its lodgment with an unerring instinct of "selection," dependent, as is above stated, upon the species that is migrating. But there are those who believe that these germs are the result and not the cause of disease, and that while germicides may destroy the bacteria they have little or no influence in arresting disease or limiting the progress of an epidemic. Contending that if it can be proved that living organisms (microbes) are the cause of contagious, infectious, or other diseases, and that each disease can be diagnosed by the presence of a particular species of bacteria, it only remains to find and be able to apply a suitable germicide for each species and its spores in order to banish all such diseases from the face of the earth.

The following is a list of the "recognized" pathogenic germs (micro-organisms):—

- Bacillus anthracis (Chaveau and Davaine), malignant pustule;
- Bacillus coli communis (Hueppe), cholera nostras;
- Bacillus lepræ (Danielson and Boeck);
- Bacillus mallei (Loeffler), glanders;
- Bacillus tuberculosis (Koch, 1882);
- Bacillus typhi abdominalis (Eberth and Gaffky), typhoid fever;
- Diplococcus pneumonia (Frankel) (first discovered by Surgeon Sternberg, U. S. A.);
- Micrococcus gonorrhea (Neissen);
- Micrococcus pyæmia (Koch);
- Plasmodium malaria (Laveran, Councilman, etc.);
- Spirillum cholerae Asiaticæ (Koch, 1884);
- Spirillum Obermyeri, relapsing fever;
- Staphylococcus pyrogenus aureus, staphylococcus albus, staphylococcus citreus (osteomyelitis);
- Streptococcus erysipielatis;
- Streptococcus phlegmon;

The following is a list of germs claimed by some to exist, but not yet established as causing disease:—

- Bacillus malarie (Tommasi and Crudeli);
- Bacillus scarlatina;
- Bacillus of syphilis;
- Bacillus of tetanus;
- Micrococcus of yellow fever (Freire);
- Micrococcus of beri-beri;
- Micrococcus of dengue;
- Micrococcus of diphtheria;
- Micrococcus of parotitis (mumps);
- Micrococcus of scarlatina;
- Micrococcus vaccine;
- Micrococcus variolæ.

The foregoing lists were prepared by Dr. J. J. Kinyoun, Assistant Surgeon, U. S. M. H. S.

Whether or not germs are the cause or propagators of certain diseases, it has been pretty well established that thorough disinfection and cleansing of a room in which smallpox, scarlet fever, or diphtheria has occurred appears to render it safe for occupancy by a person who has never suffered with these diseases; but on the other hand anti-germ theorists claim that it has not yet been clearly demonstrated that disinfection alone will prevent the spread of yellow fever or cholera.

Before leaving this interesting subject it may be stated as the consensus of opinion among scientists that the "germ theory of disease" has been clearly demonstrated, and that the "microbe" is the *materies morbi* which must be sought for and destroyed in all so-called zymotic diseases.

Ptomaines.—This name was given by the Italian chemist and toxicologist, Francesco Selmi, to certain chemical compounds, basic in character, resulting from the putrefactive decomposition of organic matter. What concerns the sanitarian more particularly is that they are found in poisonous quantities in impure milk, cheese, ice-cream, meats, fish, etc. The name is derived from the Greek word *πτωμα* (cadaver), as experiments upon decaying human bodies disclosed alkaloids, both poisonous and inert, similar

to those subsequently discovered in articles of impure food. Briefly stated, distinguished chemists and scientists have for over half a century endeavored to isolate the poisonous principle of putrefying organic matter. Prof. Panum demonstrated that the poison of decomposing flesh is not volatile, is not destroyed by boiling, is insoluble in alcohol but soluble in water, and that its intensity is comparable to that of the venom of serpents, of curare, and certain vegetable alkaloids, and that it contains no living organism. It has further been demonstrated that ptomaines are the result of putrefactive decomposition, and that bacteria are the active agents of this process (Pasteur), also that it depends on the kind of bacteria, the degree of putrefaction, and perhaps the atmospheric conditions, whether the ptomaine is poisonous or inert. Prof. Brieger, of Berlin, obtained a toxic ptomaine from cultures of typhoid bacillus which had the composition of $C_7H_{17}NO_2$; and, although this bacillus would produce a poisonous ptomaine when cultivated in beef tea, it did not produce any ptomaine when cultivated in solution of peptone, where it grew equally as well. The following ptomaines, among others, have been isolated, and their composition determined: from putrid flesh, neuridine ($C_5H_{11}N_3$) and neurin ($C_5H_{13}NO$), the former inert and the latter poisonous; from decomposed fish, muscarine ($C_5H_{15}NO_3$) and gadanine ($C_6H_{17}NO_{11}$), the latter inert; rotten cheese and decomposed glue gave neuridine; the cadaver gave six different inert and three highly poisonous ptomaines, depending upon the different stages of decomposition of the cadaver; from mussels, mytilotoxine; from putrefying yeast, sepsin; from impure milk, cheese, and ice-cream, tyrotoxin. The latter poisonous ptomaine was isolated by Victor C. Vaughan, Ph.D., M.D., of Ann Arbor, Mich., in 1885-86; the numerous and heretofore incomprehensible poisonings from these articles leading him to make a thorough and exhaustive examination into their cause, resulted in this brilliant discovery, which has since been confirmed by a number of other distinguished chemists. It is quite possible that the great poisoning of the guests at the National Hotel in Washington, D. C., many years ago, was caused by ptomaines in the milk. It has also been suggested that ptomaines are the active agents in septicæmia.

The foods in which poisonous ptomaines are found, according to Vaughan, are mussels, sausage, hams, canned meats, fruits and vegetables, cheese, milk, and ice-cream.

1. **Mussels.**, of which there are three varieties, one kind producing gastro-intestinal irritation; in the second and most frequent variety the symptoms are of a nervous character, with a sensation of heat and itching, followed by an eruption and distressing asthmatic breathing; the third kind produces an intoxication similar to alcohol, followed by paralysis, coma, and death.

2. **Sausage.**—Poisonous sausage, also known as *botulismus* and *allantotoximum*, gives symptoms of a diversified character. There is difficulty of breathing and of swallowing, nausea, vomiting, vertigo, dilatation of the pupils, small, rapid, and thready pulse, nervous prostration and debility, delirium and coma, resulting in a mortality of over fifty per cent.

3. **Hams.**—The ptomaine in putrefying ham has not yet been isolated, but the "Wellbeck poisoning" a few years ago demonstrated that it exists and is potent in energy.

4. **Canned meats, fruits and vegetables.**—The ptomaine may be developed after the can is opened if its contents are not immediately used, or putrefaction may be in progress when canned, or it may be completed when it reaches its destination.

5. **Cheese.**—After many attempts Prof. Vaughan

succeeded in isolating the poisonous ptomaine of cheese. From sixteen kilograms of one cheese he obtained 0.5 grain of the poison and the individual crystals were plainly visible to the eye. Some 300 cases of poisoning occurred in Michigan from eating twelve different cheeses, nine from one factory and one each from three others. Prof. Vaughan says: "The cheese was in good condition, and there was nothing in the taste or odor to excite suspicion. However, from a freshly cut surface there exuded numerous drops of a slightly opalescent fluid which reddened litmus instantly and intensely." Surgeon Sternberg, U. S. A., found numerous micrococci in this fluid, "but inoculation of rabbits with these failed to produce any results." Wallace and Wolf have each, more recently, detected tyrotoxin in cheese, the one in Jeansville, Pa., and the other in Shamokin, Pa. The symptoms of poisoning are dryness and constriction of the throat, vomiting of thin watery fluid, with diarrhoea and watery stools, pulse feeble and irregular, countenance pale with marked cyanosis, tenderness over the stomach, and other symptoms similar to those of arsenic poisoning.

6. *Milk*.—Following Vaughan's discovery, Newton and Wallace obtained poisonous ptomaines from milk used at the hotels at Long Branch when fifty-four persons were poisoned at two hotels in that place in 1886. Their report is of great value, but lack of space forbids its reproduction here. In Corning, Iowa, the same poison was recently found by Shearer in milk used at a hotel, and in the vomited matter of those who drank it. The symptoms of poisoning are similar to those from cheese poisoning.

Ice-cream.—Vaughan obtained tyrotoxin from cream which poisoned many persons at Lawton, Mich., in 1886; so also did Novy. It was at first thought that vanilla caused the trouble, but this was soon proved to be a mistake, and the poisonous ptomaine (tyrotoxin) was isolated from the cream. An interesting account is given by Allaben, of poisoning by lemon ice-cream, and by Shearer of poisoning by both lemon and vanilla cream. The symptoms of poisoning are similar to those of cheese and milk poisoning.

Stale fish.—The London *Lancet* of Feb. 20, 1886, gives an account of poisoning by stale fish in which ptomaine was found both in the fish and the contents of the stomach, intestines, liver, blood, brain, and urine of the victims.

Certain diseases, it is believed, may be caused by ptomaines: Anthrax, cholera, tetanus, typhoid fever, and cholera infantum: there would seem to be good ground for believing that cholera infantum may result from tyrotoxin, which, as Vaughan says, is strengthened by "the fact that infants nourished exclusively from the mother's breast are most wholly exempt from this disease."

As ptomaines are the result of putrefactive decomposition, and as bacteria are the cause of the latter (Pasteur), it is necessary to destroy the germs to prevent the formation of the former, particularly as nearly all ptomaines are indestructible by the most powerful disinfectants, and are not rendered harmless by boiling. Vaughan however states that, "in exceptional cases, as in milk containing tyrotoxin, boiling the milk will destroy both the germ and the ptomaine." The sanitarian, however, will avoid being poisoned by ptomaines by obtaining his meats and fruits fresh, his cheese, milk, and ice-cream pure: this he will do by knowing where the meats are cured or canned, and the condition of the dairy from which his cheese and milk are obtained.

The value of the discovery of ptomaines as a cause of poisoning will lead to a more careful inspection of our foods, particularly of cheese, milk, and cream,

and at the same time remove the suspicion which may have hung over many communities that their people were subjected to wholesale poisoning by some secret enemy. In a medico-legal investigation its importance is evident.

Domestic hygiene is the fundamental principle underlying public health—the family is the unit of the nation—the fountain must be pure, or they seek in vain who try to purify the stream. Sanitary science then should be taught at home, in the school-room, the college, and the university, commencing with the care of the infant and continuing to that of the child and adult. Personal cleanliness, attention to the secretions and excretions, bodily exercise, proper food, drink, apparel, and domicile should each be considered.

Public hygiene, or the conditions necessary for the health of communities, includes the above, and in addition the study of, 1. The climate and how to render its vicissitudes less dangerous. 2. The telluric conditions and surroundings and how to render the land and air dryer by drainage. 3. The site or location of dwellings, the material of which they are built, their heating, lighting, and ventilation. 4. The arrangements of streets and alleys, their paving, cleansing, and repair. 5. The water supply, where and how obtained and distributed, its quality and quantity, and the disposal of house-waste and sewage. 6. The food supply, markets, slaughter-houses, bakeries, canned and condensed-food factories. 7. The effects of trades, manufactures, and other pursuits or employments. 8. The location, construction, internal arrangement and condition of tenement-houses, and public buildings, including churches, school-houses, hospitals, and prisons. 9. The management of contagious and infectious diseases, vaccination, isolation, disinfection, and house-to-house sanitary inspection. 10. Vital statistics, registration of births, marriages, and deaths. 11. Disposal of the dead, inhumation, cremation, coking, embalming, and electro-plating.

Probably the most important factors in the propagation of disease may be found in the water supply of cities and in the disposal of their sewage. The pollution of rivers and other sources of supply has long engaged the attention of sanitarians and others, and plans for the disposal of sewage in some other manner than by depositing it in the adjacent water-courses have from time to time been tried. When it is remembered that in the large cities of the United States the present plan for the disposal of sewage not only pollutes the water-supply of its own or of neighboring towns, but involves the whole city in a network of filthy sewers which underlie the streets, enter the dwellings, and contaminate the very air we breathe, it would seem that the time had arrived for adopting some other plan for its disposal than that of emptying it into the water we drink, and having its filthy emanations infecting our dwellings. Sanitary science has pointed out the remedy, but the general adoption of it is difficult to accomplish, perhaps will not be attained for many years. It is simply to collect the excrementitious products (feces and urine) in suitable vessels and either use them as a fertilizer, or destroy them by cremation. The former plan is much the cheaper and is said to be almost self-supporting. In Japan it is done at a profit to the householder who is paid for the deposit. The latter is safer on account of the possible propagation of such diseases as cholera and typhoid fever by the "germs" finding their way back into the drinking water of out-lying villages or farms where the fertilizer is used. Omitting the pneumatic system of Liernur, which requires water-closets, soil pipes, and fecal reservoirs, there are two plans which have been approved by sanitarians as satisfactory

for securing the faecal deposits for fertilizing purposes, the "pail" system, better known as the "Rochdale," and the earth or ash-closet system ("commode"), first introduced by Rev. Henry Moule of England. Both of these systems are in use to a moderate extent in this country and are rapidly growing in favor. Heap's patent dry earth or ashes closet, with its automatic urine separator and self-acting hopper, requires less earth for deodorizing purposes and therefore is better adapted for use where earth or ashes cannot readily be obtained. Both of these systems have been extensively used in England. Manchester (including Salford), with a population of nearly 800,000 souls, is said to contain but 11,000 water-closets against 66,000 pail-closets, notwithstanding the fact that it is thoroughly sewered, has an abundant water supply, and the Irwell river courses through it. The other plan, cremation, includes the destruction, not only of the faeces, but of all kinds of house refuse, garbage, broken crockery, street sweepings, dead animals, etc., which are dumped into a "destructor" where all is reduced to ashes except the old pots, pans, crockery, glassware, etc., which becoming fused together are broken up and used for making roads, or ground and made into bricks, etc. For the disposal of sewage by water and a description of earth-closets see *ENCYCLOPEDIA BRITANNICA*, Vol. XXI., p. 717 (p. 745, Am. Rep.). The filtration of water by the "Hyatt pure water system" is regarded as satisfactory where it is found that any impurities exist in the general water supply. For domestic purposes there are many kinds recommended.

Heating and Ventilating of houses, public and private, are now regarded as most important problems by the architect in preparing his plans. (See "Heating" in the *BRITANNICA*, and *VENTILATION* in this work.) Many experiments have been tried, all systems having for their object the introduction of pure air properly heated, and the expulsion of the vitiated air resulting from the respiration and the emanations of its occupants, this interchange must be imperceptible or a feeling of discomfort arises from the draught created. "Gouge's system of ventilating and heating," and the Ruttan-Smead system, based on scientific principles, are commended as among the best. The general subject is too extensive to consider here.

Disinfectants. (See this title in the *ENCYCLOPEDIA BRITANNICA*, and in this work.) These are agents used for destroying the infectious material (germs) of infectious diseases, and should not be confounded with deodorizers or antiseptics which simply destroy bad odors or arrest putrefactive decomposition. Admitting the "germ theory of disease" to be correct, the exhaustive exposition of the present knowledge on this subject, made by the chairman of the committee on disinfectants appointed by the American Public Health Association, Major George M. Sternberg, Surgeon U. S. A., is a contribution to Sanitary Science of incalculable value, as in fact is the entire report of the committee. (See *Public Health Papers and Reports of the American Public Health Association*, Vol. XIII., pp. 64 to 201. Concord, N. H., 1888.)

Space can here be given only for the "conclusions" of the committee, as follows:—

"The most useful agents for the destruction of spore containing infectious material are: 1. Fire; complete destruction by burning. 2. Steam under pressure, 105° C. (221° F.) for ten minutes. 3. Boiling in water for half an hour. 4. Chloride of lime (which should contain at least 25 per cent. of available chlorine), a 4 per cent. solution. 5. Mercuric chloride, a solution of 1:500.

"For the destruction of infectious material which owes its infecting power to the presence of micro-organisms not containing spores, the committee

recommends: 1. Fire; complete destruction by burning. 2. Boiling in water for ten minutes. 3. Dry heat, 110° C. (230° F.) for two hours. 4. Chloride of lime, a 2 per cent. solution. 5. Solution of chlorinated soda (containing at least 3 per cent. of available chlorine), a 10 per cent. solution. 6. Mercuric chloride, a solution of 1:2000. 7. Carbolic acid, a 5 per cent. solution. 8. Sulphate of copper, a 5 per cent. solution. 9. Chloride of zinc, a 10 per cent. solution. 10. Sulphur dioxide, which will require the combustion of between three and four pounds of sulphur for every 1000 cubic feet of air space. There should be exposure for twelve hours to an atmosphere containing at least 4 volumes per cent. of this gas in presence of moisture.

"The committee would make the following recommendations with reference to the practical application of these agents for disinfecting purposes: *For excreta.* (a) In the sick-room: 1. Chloride of lime in solution, 4 per cent. In the absence of spores: 2. Carbolic acid in solution, 5 per cent. 3. Sulphate of copper in solution, 5 per cent. (b) In privy vaults: 1. Mercuric chloride in solution, 1:500. (The addition of an equal quantity of potassium permanganate as a deodorant, and to give color to the solution, is to be recommended.) 2. Carbolic acid in solution, 5 per cent. (c) For the disinfection and deodorization of the surface of masses of organic material in privy vaults, etc.: Chloride of lime in powder.

"*For clothing, bedding, etc.* (a) Soiled underclothing, bed linen, etc.: 1. Destruction by fire if of little value. 2. Boiling for at least half an hour. 3. Immersion in a solution of mercuric chloride of the strength of 1:2000 for four hours. 4. Immersion in a 2 per cent. solution of carbolic acid for four hours. (b) Outer garments of wool or silk, and similar articles, which would be injured by immersion in boiling water or in a disinfecting solution: 1. Exposure in a suitable apparatus to a current of steam for ten minutes. 2. Exposure to dry heat at a temperature of 110° C. (230° F.) for two hours. (c) Mattresses and blankets soiled by the discharges of the sick: 1. Destruction by fire. 2. Exposure to superheated steam, 105° C. (221° F.) for ten minutes (mattresses to have the cover removed or freely opened). 3. Immersion in boiling water for half an hour.

"*Furniture and articles of wood, leather, and porcelain.* Washing, several times repeated, with: 1. Solution of carbolic acid, 2 per cent.

"*For the person.* The hands and general surface of the body of attendants of the sick and of convalescents should be washed with: 1. Solution of chlorinated soda diluted with nine parts of water, 1:10. 2. Carbolic acid, 2 per cent. solution. 3. Mercuric chloride, 1:1000.

"*For the dead.* Envelop the body in a sheet thoroughly saturated with: 1. Chloride of lime in solution, 4 per cent. 2. Mercuric chloride in solution, 1:500. 3. Carbolic acid in solution, 5 per cent.

"*For the sick-room and hospital wards.* (a) While occupied wash all surfaces with: 1. Mercuric chloride in solution, 1:1000. 2. Carbolic acid in solution, 2 per cent. (b) When vacated, fumigate with sulphur dioxide for twelve hours, burning at least 3 pounds of sulphur for every 1000 cubic feet of air-space in the room; then wash all surfaces with one of the above-mentioned disinfecting solutions, and afterwards with soap and hot water; finally throw open doors and windows and ventilate freely.

"*For merchandise and the mails.* The disinfection of merchandise and of the mails will only be required under exceptional circumstances; free aeration will usually be sufficient. If disinfection seems necessary, fumigation with sulphur dioxide will be the only practicable method of accomplishing it without injury.

"*Rags.* (a) Rags which have been used for wiping away infectious discharges should at once be burned. (b) Rags collected for the paper-makers during the prevalence of an epidemic should be disinfected before they are compressed into bales by: 1. Exposure to superheated steam of 105° C. (221° F.) for ten minutes. 2. Immersion in boiling water for half an hour.

"*Ships.* (a) Infected ships at sea should be washed in every accessible place, and especially the localities occupied by the sick, with: 1. Solution of mercuric chloride, 1:1000. 2. Solution of carbolic acid, 2 per cent. The bilge should be disinfected by the liberal use of a strong solution of mercuric chloride. (b) Upon arrival at a quarantine station an infected ship should at once be fumigated with sulphurous acid gas, using 3 pounds of sulphur for every 1000 cubic feet of air-space; the cargo should then be discharged on lighters; a liberal supply of the concentrated solution of mercuric chloride (4 ounces to the gallon) should be thrown into the bilge, and at the end of twenty-four hours the bilge-water should be pumped out and replaced with pure sea water; this should be repeated. A second fumigation, after the removal of the cargo, is recommended; all accessible surfaces should be washed with one of the disinfecting solutions heretofore recommended, and subsequently with soap and hot water.

"*For railway cars.* The directions given for disinfection of dwellings, hospital wards, and ships apply as well to infected railway cars. The treatment of excreta with a disinfectant, before they are scattered along the tracks, seems desirable at all times in view of the fact that they may contain infectious germs. During the prevalence of an epidemic of cholera this is imperative. For this purpose the standard solution of chloride of lime is recommended."

SAN JACINTO, a battle fought on April 21, 1836, between a force of Texans under Gen. Sam Houston (for whom see *ENCYCLOPÆDIA BRITANNICA*), and a Mexican army under Gen. Santa Anna. The latter on hearing of the independent movement in Texas led an army of 5000 men, determined to crush the opposition to his despotism. He first wreaked his vengeance on the garrison of the ALAMO (q. v.). Houston's men were greatly agitated on hearing of the massacre, and of a second at Goliad where Col. Fannin with 500 men had capitulated on March 27th. Houston sought a position near the mouth of the San Jacinto, where there was a ferry, and there Santa Anna came up with him on April 20th. The Texans, numbering 783 men, all told, had two small cannon. On the morning of the 21st Houston ordered a charge on the Mexican host of 2000, and with shouts of "Remember Alamo!" "Remember Goliad!" the Texans carried all before them. Of the Mexicans 630 were killed and the rest captured. The Texan loss was 8 killed and 25 wounded. Although the Texans clamored for Santa Anna's life, Houston, who had been wounded severely, spared him on condition of his acknowledging the independence of Texas. The treacherous Mexican afterwards tried to repudiate his word, but the war was not renewed.

SAN JOSE, a city of California, seat of Santa Clara co., is 50 miles south of San Francisco, with which it is connected by three lines of railroad. It has a fine court-house, city hall, 2 national banks, 3 other banks, 4 daily and 4 weekly newspapers, 15 churches, 13 schools, the State Normal School, University of the Pacific, and College of Notre Dame. The Leland Stanford, Jr., University, founded here by Leland Stanford, president of the Central Pacific Railroad, in memory of his son, has been endowed with \$20,000,000. Lick Avenue, 28 miles long, leads to Lick Observatory on Mount Hamilton. San Jose was established as a mission by Spanish Franciscans in 1777, but Americans came in 1847 and the city was incorporated in 1850. It is lighted with gas and numerous electric lights, has water-works, and three parks. There is a paid fire department with good apparatus and an automatic fire-alarm system. The property is assessed at nearly \$18,000,000, and the only debt is bonded indebtedness of \$500,000 for the city hall and other improvements. The yearly expense in 1887 was \$371,572. The city has 5 foundries, a woollen mill, flour mill, furniture factory, 3 fruit canneries, and a few factories. The surrounding country produces abundance of grapes, prunes, and other fruits. Wine-making is extensively carried on. The climate of the vicinity is very salubrious, the extreme annual range of the temperature being from 28° to 93°, and the average from 42° to 70°. The population in 1880 was 12,567.

SARATOGA, BATTLE OF. This battle, in virtue of its results, has been classed among the fifteen decisive battles of the world. The British ministry, irritated at the failure of their attempts to crush out the American movement for independence, resolved to effect this by a supreme effort in 1777. So long as the communications between New England and the South remained free this seemed impracticable. It was determined, therefore, to sever these by pouring an army from Canada through the half-open gateway of Ticonderoga, whence they should sweep southward, and, by effecting a junction with Howe, who held New York, interpose a barrier between these sections of the Union.

Gen. John Burgoyne, who was entrusted with the carrying out of the scheme, stood, on June 1st, at the foot of Lake Champlain with an army of 7000 English, Germans, Canadians, and Indians, while Col. St. Leger was sent up the St. Lawrence to Oswego to penetrate the country from that point, capture Fort Schuyler, and then march down the Mohawk to join Burgoyne in Albany. On Burgoyne's appearance before Ticonderoga, St. Clair, the commander, conscious of his inability to hold the fort, fled towards Fort Edward, the place of rendezvous for the patriots. The British pursued, inflicting a defeat on him at Hubbardton, and Gen. Schuyler, commander of the patriot army of the North, fell back from Fort Edward to Cohoes Falls. Meanwhile St. Leger was besieging Fort Schuyler, but Arnold, who was dispatched with 800 men to its relief, scattered the royalists like autumn leaves.

Such were the circumstances under which the main army of the North was placed at the mouth of the Mohawk in August, 1777. Here Schuyler was superseded by Gates, while Burgoyne, discouraged by the disaster at Bennington and the loss at Fort Schuyler, was halting at Fort Edward in hopes of hearing from Howe. This gave Gates time to advance up the Hudson to Bemis Heights and fortify them for his encampment. By Sept. 15th he stood prepared to receive the foe.

Burgoyne ascended the river by the left bank, crossed it on the 13th and 14th at Saratoga, and, on the 18th, was within 2 miles of Gates and making ready for battle. On the morning of the 12th the rival hosts stood confronting each other posted in

similar order, each stretching from the river over the hills westward. The main body of the Americans was on the right under Gates; the left was under Poor; the centre was mainly made up of Learned's brigade. Morgan's riflemen and Dearborn's infantry stood under Arnold on the heights, nearly a mile from the river. At 10 A. M. Burgoyne advanced his army in three columns, the left consisting of artillery under Phillips, and Germans under Riedesel, the centre and right under Burgoyne himself, but covered by Fraser and Bregman. The Canadians and Indians were sent forward to occupy the Americans in front. Gates remained passive till, urged by Arnold, he gave the word for the Indians to be driven back. Taking this as a permission for a general charge, the Americans rushed like a mountain torrent on the foe. Arnold with Morgan held Fraser while he was straining to reach the American rear. Here the fighting was desperate, but the patriots encountering the British under Burgoyne, and played on by Phillips' guns, were, at 3 o'clock, forced back into their line. For four hours Arnold had maintained the fight with the choicest English regiments. A lull occurred during which both parties drew breath. The English again advanced. The Americans kept within their camp till their foe was on the point of charging, when, springing forth, they drove it back over the intermediate clearing. Night put an end to the conflict. The Americans retired to their intrenchments; the British lay on the battle-field. The loss of the former was 64 killed and 217 wounded, that of the latter rather more than 500. Both claimed the victory, but the British had failed to force their way to Albany.

The two armies lay for several days inactive. On Sept. 29th Gen. Benjamin Lincoln joined Gates with 2000 men, while Burgoyne's army melted away through desertion. In vain did he call on Howe and Clinton. His provisions began to fail; he must fight or flee. On Oct. 7th he determined to make a reconnaissance in force and replenish his stores by foraging. His foragers were discovered and, at 2.30 P. M., the struggle was recommenced. Arnold and Morgan were the inspiring spirits for the patriots, Fraser for the British. At length the last was struck down, and panic seized the royalists, which was augmented by the appearance of 3000 fresh troops under Gen. Tenbroeck. The British were driven within their lines. Both armies were exhausted, the Americans being as incapable of following up their advantage as the British of repairing their discomfiture. The American loss was 150; the British, 700.

The 8th was spent in heavy skirmishing, till, at evening, Burgoyne, leaving his baggage and wounded, set out on a night march for Saratoga. On the 9th he encamped on the heights north of Fishkill. Gates pursued on the 10th and reached the heights between Saratoga church and the Fishkill in the afternoon.

Burgoyne now saw no means of saving his army save by a precipitate flight to Fort Edward, which he hoped to capture. With this view he sent a working-party in advance. Gates, supposing this to be the whole British army in retreat, ordered a general advance over the Fishkill. Burgoyne appreciating his mistake, leaving a guard in his camp, aided by a fog, ambushed his main force in an adjoining thicket. The Americans on crossing were received by a heavy fire. Gates now learned the truth from a deserter and recalled his men to their positions. Burgoyne saw that there was no longer hope of escape. His position was exposed to fire on all sides; the roads to the north were impassable and the woods swarmed with patriots; he had bread only for three days and water was inaccessible. On the 13th he called a council of war and it was

resolved to treat with Gates for honorable surrender. After negotiating, terms were agreed to on the 16th, and, on Sept. 17th, articles were subscribed whereby the British were permitted to march out of the camp with the honors of war, surrendering their artillery, arms, and ammunition, and engaging not to serve again during the war. Burgoyne, in presence of the two armies, in the afternoon, surrendered his sword to Gates who promptly returned it. The British troops then filed off to Boston, whence they were to embark for England. But Congress afterwards refused to carry out the terms of surrender, and the British prisoners were taken to Pennsylvania and Virginia, where they mostly remained till the close of the war. (J. H.)

SARDOU, VICTORIEN, French dramatist, was born at Paris Sept. 7, 1831. The son of a classical professor, he had in early manhood a severe struggle with poverty. He gave lessons in various branches, wrote for reviews, dictionaries, and newspapers, and even composed a play which failed miserably. It was not until his marriage with Mlle. de Brécourt, in 1858, gave him access to the theatre manager Déjazet that he entered fairly on the field in which he achieved a flattering success. His play *Candide* (1860) was soon followed by a shoal of others, produced at various theatres. Among them may be noted *Nos Intimes*, *Les Pattes de Mouche*, *La Perle Noire*. Offenbach contributed the music to his comic operas. Sardou's career was interrupted for a while by the overthrow of the Empire, but early in 1872 he brought out *Rabagas*, a political comedy, in the style of Aristophanes, aimed at Gambetta. Its representation excited serious disturbances in Paris and in the provinces. His noted caricature, *L'Oncle Sam*, was actually prohibited for a time at Paris lest it should produce diplomatic complications with the United States. But when produced in New York, in March, 1873, it caused more astonishment than anger. A later noted comedy, *Daniel Rochat* (1890), turned on the question of religious marriages, various views of which were presented by characters easily recognized. Sardou was chosen a member of the French Academy in June, 1877, and his reception took place May 23, 1878. His most noted later works are *Fédora* and *Théodora*, both written for Sarah Bernhardt. They have proved as popular on the English and American stage as in Paris. Sardou's comedies, struck off rapidly, are full of spirit, and reproduce vividly on the stage the movements of the world around him. With Shakespearean directness and confidence in his right to whatever he finds worth taking he has not hesitated to make use of situations and scenes already employed by others. His popularity has not been in the least affected by this open plagiarism. Sardou was married in 1872 to Mlle. Soulier, daughter of the keeper of the museum at Versailles.

SARGENT, EPES (1812-1880), a prolific author of popular books, was born Sept. 27, 1812, at Gloucester, Mass., where his family had resided for more than a century. In boyhood he visited Russia and for two years he studied at Harvard College. He became connected with the *Boston Daily Advertiser*, but he and his elder brother, John Osborne Sargent, who was afterwards noted as a lawyer, assisted S. G. Goodrich (for whom see *ENCYCLOPEDIA BRITANNICA*) in the preparation of the popular series issued under the name of "Peter Parley." Epes Sargent was for many years engaged as a journalist, sometimes in New York and Washington, but mostly in Boston. He and his brother were active in the interest of the Whig party. Epes also wrote for the stage but without marked success, his chief plays being *The Bride of Genoa* (1836), and the tragedies *Velasco* (1837) and *The Priestess* (1855). In his later years his chief occupation was the preparation of readers, speakers, and other school books, which,

by their excellence, obtained wide circulation. He also edited some books of adventure and wrote *Planchette* (1869), an account of spiritualism, in which he was then a believer. At various times he had published volumes of verse, and his *Songs of the Sea* (1849) included the popular song "A Life on the Ocean Wave." His latest poem was *The Woman Who Dared* (1869). Among his novels may be noted *Peculiar* (1863), a tale of the overthrow of slavery. He died at Boston, Dec. 30, 1880.

SARGENT, LUCIUS MANLIUS (1786-1867), temperance advocate, was born in Boston June 25, 1786, being a grandson of Col. Epes Sargent (1690-1762). He studied at Harvard College and was admitted to the bar but did not practice, being possessed of ample fortune. He was a frequent contributor to the *Boston Transcript*, and his antiquarian sketches, *Dealings with the Dead, by a Sexton of the Old School*, were republished in 1856. His *Temperance Tales*, at first issued separately, had extensive circulation in Europe and Australia, as well as at home, and were afterwards collected in various editions. He married a sister of Horace Binney, the eminent lawyer of Philadelphia, and his sons were distinguished in the war for the Union. He died at West Roxbury, June 2, 1867.

SARGENT, WINTHROP (1753-1820), a cousin of the preceding, was born at Gloucester, Mass., graduated at Harvard College in 1771, and after some experience of naval life entered the American army in 1775. He served in the artillery throughout the Revolutionary war and attained the rank of major. After the war he took part in the enterprise of the Ohio Company, and in 1786 was appointed by Congress surveyor of the Northwest Territory. He was adjutant general in St. Clair's army in 1791 and again in Wayne's in 1794, and was first governor of Mississippi Territory, 1798-1802. He died on a voyage from Natchez to Philadelphia, June 3, 1820.

His grandson, WINTHROP SARGENT (1825-1870), was born in Philadelphia, Sept. 23, 1825, graduated at the University of Pennsylvania in 1845 and at the Harvard Law School in 1847. He published a *History of Braddock's Expedition* (1855), *Loyalist Poetry of the Revolution* (1857), with a supplementary volume in 1860, *Journal of the Meeting of the Cincinnati* in 1784 (1851), *Life of Major André* (1861), and *Letters of John Andreus*, 1772-6 (1866). He also contributed to the *North American Review* and other periodicals. He practised law in Philadelphia and afterwards in New York, and died in Paris May 18, 1870.

SARMIENTO, DON DOMINGO FAUSTINO, President of the Argentine Republic, was born at San Juan in 1811. He was one of the opponents of the Dictator Rosas and was banished, but returned in 1836, and established a school for young ladies. He became editor of a newspaper and was again banished by Rosas. He then entered the service of Chili and was sent to Europe to examine and report upon educational institutions and systems. In 1851 he returned to Buenos Ayres, and was colonel of a regiment in the battle of Monto Casseros, by which the power of Rosas was overthrown. Sarmiento then took a prominent part in framing the new constitution of the Argentine Confederation. He was minister of instruction, and afterwards of the interior. He also served as governor of San Juan. In 1865 he was sent as minister to the United States and in 1868 he was peacefully elected president of the Argentine Confederation. An unfortunate war, occasioned by the assassination of Gen. Urquiza, greatly injured the prosperity of his administration. It ended early in 1873 in the victory of the national troops. Sarmiento has published several works on the history of his country. Mrs. Horace Mann's translation of his *Life in the Argentine Republic* (1868) gives his biography.

SARTAIN, JOHN, who has been called the founder in America of mezzotint engraving, was born in London Oct. 24, 1808, and came to the United States in 1830. He was originally an engraver in the line manner, but in 1828 commenced to practise mezzotint, and afterward usually mingled line, mezzotint, and stippling in his plates. For some years he was also engaged in painting portraits in oil and miniatures on ivory. Later he abandoned painting and devoted himself entirely to engraving and literary work. Always exceedingly industrious, he has produced an enormous amount of work for various periodicals, annuals, and illustrated books. Of his large framing prints the best known are *Christ Rejected*, after West; *The Iron Worker* and *King Solomon*, American Inventors, and Zeisberger preaching to the Indians, after Schussele; *John Knox* and *Mary Queen of Scots*, after Leutze; and the *Battle of Gettysburg*, after Rothermel. In 1843 he became proprietor and editor of *Campbell's Foreign Semi-Monthly and Magazine*, and at the same time he had an interest in the *Eclectic Museum*. During some years after 1848 he was part-owner and editor of *Sartain's Union Magazine* (formerly the *Union Magazine*). He has held office in the Pennsylvania Academy and in various artistic and other societies in Philadelphia, and in 1876 had charge of the art department of the Centennial Exhibition. He has also been the recipient of numerous medals and other honors from various European countries. Three of his children have also chosen art as a profession. His son, SAMUEL SARTAIN, born Oct. 8, 1830, in Philadelphia, is well known as an engraver. His work consists principally of portraits and other illustrations for books, but he has also executed a number of large prints, notably *Clear the Track*, after Schussele; *Christ Blessing Little Children*, after Eastlake, and portraits after Neagle, Sully, and other painters. Another son, WILLIAM SARTAIN, born in Philadelphia, Nov. 21, 1843, also began his career as an engraver, but later turned his attention to painting. His art studies were begun under Schussele and continued in Paris under Léon Bonnat. In 1877 he returned to the United States and became an associate of the National Academy three years later. As a teacher he is widely known, having been instructor in various art schools in New York and Philadelphia. Among his paintings, many of them Oriental or Italian subjects, are *Italian Boy's Head* (1876); *Narcissus* (1878); and *Nubian Sheik* (1879). His daughter, EMILY SARTAIN, born March 17, 1841, in Philadelphia, has also practised both engraving and painting. She studied under Schussele and Luminais, and paints principally portraits. From November, 1881, to February, 1883, she was art editor of *Our Continent*, and she has been principal of the Philadelphia School of Design for Women since 1886. (F. L. W.)

SASSAFRAS, a genus of plants, order *lauracæ*. Nearly all the plants of this order possess aromatic properties, which are due to the presence of volatile oils. The typical genus is *laurus*, the laurel, but it embraces also cinnamon, cassia, camphor, and sassafras. Sassafras is a corruption of the word *Saxifrage*, which now denotes a widely different family of herbaceous plants. It has but a single species *S. officinale*, which is common throughout the United States, forming a small tree in the North, of about 8 inches diameter of trunk, but in favorable situations southward sometimes reaching a height of 50 or 60 feet, and from 1 to 2 feet diameter. The sexes are dioecious, the leaves and flowers produced from the same buds, the younger branches and under surfaces of leaves downy, the flowers in short, slender racemes, of a pale-green color, antlers with 4 unequal cells. The female flowers possess, in addition to the pistil, six gland-like bodies, an-

swering to the stamens of the male flowers. The tree has a greyish and deeply furrowed trunk, but the young branches are of a beautiful reddish-green hue. The true bark when cut into is of a dark red color like that of Peruvian bark. The tree when old gives rise to many suckers which spring up at a short distance from the trunk, growing to a height of 6 or 8 feet. The leaves of the sassafras are remarkable for their varying forms on the same tree. Those first produced from the bud are oval and entire; the next series are lobed on one side; the last and most numerous have regularly three lobes. The flowers protrude from the sides of the branches below the leaves, the sexes being confined to different trees. The fruit or seed is oval in form, of deep blue color, and contained in small bright red cups, supported by peduncles from 1 to 2 inches long. The seeds when ripe are eagerly devoured by birds.

The sassafras tree is indigenous to every part of the United States east of the Rocky Mountains, and extends far into the Dominion of Canada, where it dwindles to a tall shrub. Every part of the tree has a pleasant fragrance, and a sweetish aromatic taste, which is strongest in the bark of the root. These qualities depend upon an essential oil, which may be obtained by distillation and has been highly valued in medicine. The sassafras early attracted the attention of Europeans from the peculiarity of its foliage and its medicinal properties. One writer called it the ague tree, and its value as a medicine was once held so high that its products commanded an extravagant price. It is said that its strong fragrance was one of the indications borne to Columbus and his followers of the nearness of land, so that it may be claimed to have borne a part in the discovery of America.

The wood of the sassafras is white and tender in young trees, reddish and more compact in older trees. While of little value as timber the wood resists decay and has been used for posts, rails, joists, and rafters, also for trunks, bedsteads, etc., under the belief that its odor drives away insects. Sassafras poles have long been used as poultry roosts for the same reason, the odor being supposed to be disagreeable to hen lice. Another use is for fishing rods, from the toughness and lightness of the seasoned wood. The bark has been used for dyeing, and gives wool a very durable orange color. The young shoots and leaves are highly mucilaginous, and the pith, which is light and spongy and very mucilaginous when chewed, is kept in shops and sold for this purpose. It is also used in water as a drink in inflammatory diseases and as an eye-wash. In Louisiana the leaves are sometimes used as a substitute for okra in making gumbo soup. They are also used in making home-made beer known as root beer, and in some sections as a seasoning for sauces.

The Indians have long used the sassafras bark medicinally and it is still used for this purpose, the root bark being preferred for its strong aromatic properties. It is kept in small fragments for flavoring official preparations, for which purpose also the oil is extracted to the extent of 15,000 or 20,000 pounds annually. Medicinally sassafras is considered an excellent stimulant and sudorific, and was formerly much used in the cure of such complaints as rheumatism, dropsy, and cutaneous eruptions. The fruits of the sassafras are much used by perfumers, who powder them and put them up in small sachets for their agreeable odor. (C. M.)

SAULCY, LOUIS FELICIEN JOSEPH CAIGNARD DE, French orientalist and numismatist, was born at Lille, March 19, 1807. He was educated at the Polytechnic School, and entered the artillery service. Meanwhile his leisure was taken up with archaeology and especially numismatics. In 1836 his essay

on the classification of Byzantine coins won a prize from the French Institute, and he was soon enrolled as a member of the Academy of Inscriptions. But his duties as military instructor were also diligently pursued, and in 1838 he became professor of mechanics in the school at Metz. Then he was transferred to Paris to be keeper of the Military Museum. In 1850 he made a visit to Palestine and explored the Dead Sea, of which he published a popular account (2 vols. 1852-54). Though his book had wide acceptance, as had also his later work on the Holy Land (1865), many of his statements were controverted. His researches in the Holy Land are said to have converted him to belief in Christianity. In 1870, on the downfall of the French empire, he accompanied the Empress Eugenie to Chiselhurst, but afterwards returned to his labors in the Academy of Inscriptions. Several of his numismatic works had reference to the Jews and to Palestine, but he had also essays on the coins of the Seleucid kings (1872), the Nabateans (1874), the Roman Republic (1874), and of various French kings. He published treatises on Cæsar's expeditions to Britain (1860), on Herod (1867), the siege of Jerusalem (1866), *Seven Centuries of Jewish History* (1874), and a *Dictionnaire Topographique de la Terre Sainte* (1877).

SAVAGE, JAMES (1784-1873), antiquarian, was born in Boston, July 13, 1784. He graduated at Harvard College in 1803, and was admitted to the bar in 1807. In 1812 he was elected to the State legislature, in 1820 was a member of the State Constitutional Convention, and afterwards held various municipal offices. He was one of the editors of the *Monthly Anthology*, 1806-11. He founded the first savings bank in Boston in 1817, and was treasurer and president of the Massachusetts Historical Society. In 1825 he edited with notes Gov. Winthrop's *History of New England* (2d ed. 1853). His principal work was *A Genealogical Dictionary of the First Settlers of New England* (4 vols. 1860-62). It was pronounced by the *North American Review* "the most stupendous work on genealogy ever compiled." The author died at Boston, March 8, 1873.

SAVAGE, MINOT JUDEON, preacher and author, was born at Norridgewood, Maine, June 10, 1841. He graduated at Bangor Theological Seminary in 1864, and went as a Congregational home missionary to California. Afterwards he supplied a church at Framingham, Mass., and became pastor at Hannibal, Mo., in 1869. His theological views having changed he became pastor of a Unitarian church in Chicago in 1873, and in the next year took charge of the Church of the Unity in Boston. He now belongs to the extreme left wing of Unitarianism, and is a bold exponent of its views. He has been a frequent contributor of both prose and poetry to journals and magazines. Among his books are *Christianity the Science of Manhood* (1873), *The Religion of Evolution* (1876), *Talks about Jesus* (1880), *Belief in God* (1881), *Beliefs about Man* (1882), *The Modern Sphinx* (1883), *The Religious Life* (1886), *Social Problems* (1886).

SAVANNAH, a city and port of entry of Georgia, county-seat of Chatham co., is on the south bank of the Savannah River, 18 miles from the Atlantic Ocean, 32° 5' N. lat., 81° 8' W. long. By rail it is 90 miles from Charleston and 682 miles from Washington. Situated partly on a bluff about 40 feet above the river, it extends 3 miles along the river and over a mile inland. The city is regularly laid out with wide streets crossing at right angles and lined with trees. There are 24 small parks and in the centre Forsyth Place, a park of 30 acres, thickly planted with forest trees, has a handsome fountain and a monument with bronze statue to the Confederate dead. Johnson Square contains a granite obelisk commemorating Gen. Nathaniel Greene, and Monterey Square a marble shaft with a statue of

Liberty, erected to the memory of Count Pulaski, who fell here Oct. 9, 1779. Among the conspicuous buildings are the Custom House, City Exchange, Cotton Exchange, Hodgson Hall, used by the Georgia Historical Society, Masonic Temple, Old Fellows' Hall, Savannah Hospital, the Catholic Cathedral, the Independent Presbyterian Church, St. John's (Episcopal) Church, and the synagogue of Mickva Israel. Savannah has 2 national and 3 State banks and some private banks, a Board of Trade and Cotton Exchange, 2 daily and 4 weekly newspapers. There are altogether 30 churches, 13 of which are used by colored people. Besides some private academies of high reputation, the county provides public schools, in which instruction is given to whites and blacks separately.

The city has street-railways, gas, and electric lights, a good system of water supply, and a paid fire department. The buildings are chiefly of brick, and many private residences are of handsome architecture. The industrial works comprise iron foundries, saw and planing mills, rice and flour mills, cotton compresses, a cotton mill, paper mill, ice factory, furniture factory, and a lithographic establishment.

The railroads are the Central of Georgia with 2050 miles, and the Savannah, Florida and Western, 634 miles, the latter connecting at Tampa, Florida, with a steamship line to Cuba. Steamships also ply regularly from Savannah to New York, Philadelphia, Baltimore, and Boston. As a cotton port Savannah ranks second in the Union, first in the rosin and turpentine trade, and second in the rice trade. It also ships largely lumber, fruit, and iron ore brought from Alabama. The exports in 1885 amounted to \$45,100,000, and the total trade was estimated at \$90,000,000.

Savannah was founded in 1733 by Gen. James Oglethorpe. It was incorporated as a city in 1789. In the Revolutionary war it was captured by the British Dec. 29, 1778, and evacuated July 11, 1783. In the civil war it was captured by Gen. W. T. Sherman, Dec. 21, 1864. Its population in 1880 was 30,709, and in 1886 by a city census 45,482, of whom 18,817 were colored. (J. H. E.)

SAVINGS BANKS. The first savings bank in the United States was organized in Philadelphia under the title of the "Philadelphia Savings Fund Society." It was a voluntary non-corporate association, composed of a few benevolent and philanthropic gentlemen who associated together for the purpose of receiving and caring for the small accumulations of surplus moneys of poor persons. This society commenced the receiving of deposits in December, 1816; subsequently, in the year 1819, it was granted a corporate franchise by the State of Pennsylvania.

The State of Massachusetts, however, was first to give legislative sanction to the organization of savings banks; this it did in the year 1817. Other States that at early dates granted charters for such institutions were Maryland in 1818, New York, Pennsylvania, Maine, Connecticut, and Rhode Island in 1819, New Hampshire in 1823, Ohio in 1831, Delaware in 1832, New Jersey in 1839 and Vermont in the year 1846. At subsequent periods charters were granted to savings banks by most of the other States. For many years all such institutions were created by special acts of the respective State legislatures, but the tendency of recent legislation has been to provide for their organization and management by general laws.

Excepting the so-called capital stock savings banks, the main features of those institutions are very similar—strikingly so, considering the fact that the savings bank system of the United States is not a co-operative system, subject to the super-

vision and control of a central authority, but rather a multitude of systems, each regulated by its own special source of authority, a State legislature. As savings banks had their inception in the Middle and Eastern or New England States, they are now most numerous and have reached their highest perfection in those localities. The most reliable data obtainable, from both official and unofficial sources, show the number of savings banks in operation in 1886-1887 to have been 684. The number in each State, together with their aggregate capital, surplus and deposits, is given in Table I.

TABLE I.—SAVINGS BANKS, 1886-87.

STATES, ETC.	Number.	Capital.*	Surplus and Undivided Profits.	Deposits.
Maine	54	\$2,199,862	\$37,215,072
New Hampshire..	66	4,604,680	50,822,763
Vermont	28	\$460,000	776,112	15,587,050
Massachusetts....	172	12,928,350	291,197,900

Total	20	3,099,700	6,712,360	77,863,586

* Only 54 savings banks report capital.

While it was purely in the spirit of philanthropy that savings banks were originally organized and operated for many years after their introduction into the United States, they no longer are confined in their operations and influences to the limited field first assigned to them. In late years they have proved attractive depositories for the surplus moneys of all classes, and every effort by legislation or otherwise, to restrict them to dealings with the poor alone, has failed. The widening of the area of their operations so as to embrace a higher order and greater number of beneficiaries has had a salutary effect; yet in many States measures have been adopted tending to prevent such expansion and more closely confine them to their original purposes, but the interests of the banks have proved stronger than restrictive laws, and the savings bank systems of the several States have grown and become strong largely through the patronage of those whom it was sought to exclude. Experience has demonstrated that those institutions lose none of their efficiency as promoters of industry, sobriety and thrift among the poorer classes for the reason that others more favored are allowed to share in their benefits. As a consequence they came to be regarded less as depositories than as organized mediums through which investments in clearly defined securities may be advantageously made.

In the year 1834 the State of Massachusetts en-

acted a general law for the organization and supervision of savings banks. At that date there was probably not more than \$7,000,000 on deposit with all of these institutions in the United States. From 1835 savings banks have occupied the public attention to a greater or less degree and the subject has been a fruitful source of legislation; the earlier of which in most States embraced provisions for the making of reports to disclose the condition of the banks in respect to resources and liabilities; such returns though imperfectly showing their condition were the subject of criticism that resulted in the enactment of laws designed to make them more secure by limiting and restricting the scope of their investments and methods of business. At later periods provisions were made for their supervision by designated State officials and examinations were provided for to ascertain whether investments had been made in accordance with the requirements of law.

Though legislation was neither regular nor uniform, the more important subjects were embraced in that of most States during the twenty years succeeding the passage of the Massachusetts general law in 1834. The attention savings banks attracted as affording desirable places of deposit for surplus moneys, practically subject to repayment on demand, was the primary cause of their being generally used by the public. So large patronage soon lifted well-conducted banks located in cities and populous centres of manufacture and trade out of their previous semi-charitable conditions. The greater demands made on the resources of the banks necessitated the employment of competent salaried clerks and managers and the extension of business hours, a few hours of gratuitous service weekly being insufficient for the transaction of their business. The increased facilities afforded early met with public favor and a phenomenally rapid development followed. The growth of savings banks in the United States for the past sixty years is shown by decades in the following table:—

Year.	Number of Banks.	Number of Depositors.	Amount of Deposits.
1825	15	16,931	\$2,537,032
1835	53	60,058	10,613,726
1845	70	145,206	24,506,677
1855	215	431,602	84,290,076
1865	317	980,844	242,619,382
1875	771	2,359,864	924,037,304
1885	684	3,158,950	1,141,580,578

Prior to the year 1870 the estimated loss to depositors with savings banks throughout the United States, by reason of failures, was but a small fraction of a mill on the dollar of aggregate deposits held by such institutions. During the seven succeeding years, however, savings bank failures were of common occurrence. In the State of New York alone 29 of these banks failed, involving a loss to depositors approximating \$5,000,000. In the other States failures were not so numerous, yet they were comparatively frequent. The inherent weakness of the unsound banks was soon developed by the suspension of industries, the depression of trade, and the depreciation of property and securities generally incident to the monetary panic of 1873, coupled with unusually heavy withdrawal of deposits at so critical a time. The conservatively managed solvent banks were little affected by the strain that forced many of the weak ones into liquidation. The failure of one savings bank after another in rapid succession produced great excitement in the localities affected and public attention was directed to the dangers to arise from the reckless incorporation of such institutions. In the year 1855 only 215 savings banks were in existence throughout the United States, in 1875 the number had reached 771. Within that period the war of the Rebellion occurred, producing

conditions exceptionally favorable to such institutions. The abundance of money and the activity of every branch of industry materially aided the rapid accumulation of deposits. The National government was then a large borrower and its bonds were available for investment by savings banks on the most advantageous terms. In seconding the efforts of the government in its struggle for existence, the cities, counties and towns became borrowers of large sums at high rates of interest; those securities also were generally taken by savings banks. Such conditions produced all elements conducive to prosperity for financial institutions; industries active in every department, an abundant currency and facilities for speedy and profitable investment. The seeming prosperity created and promoted by the war did not of course subside immediately on its termination, and the evil effects of the ill-advised multiplication of savings banks were not made fully apparent until the coming of the panic of 1873, when finance, trade, commerce and industries all became unsettled and the manufacturing districts idle, making necessary the withdrawal of savings wisely accumulated for such a time of trial. The strong banks withstood the depletion of their resources, while the weak and unsound ones were swept away.

In connection with past savings bank failures in the United States, it is a noteworthy fact that but very few failures have been caused by the fraudulent appropriation of deposits. For the most part they have resulted from extravagance and a disregard of the plainest principles of prudent business management, as shown by injudicious loans and investments; made sometimes under sanction of law and sometimes without it, but usually with the purpose in view of promoting the advantage of their depositors, by securing for them higher rates of interest than strictly first class loans and investments would yield.

The weaknesses in the system disclosed by the crisis through which they passed have been provided against for the future by remedial legislation. In nearly all of the States laws have since been enacted to provide more effectual safeguards for the protection of savings banks' depositors, and legislators have responded to urgent demands for more stringent and carefully considered laws for their government. Many States have repealed the special laws under which savings banks previously operated and made provisions for their organization and supervision by general law.

Owing to the numerous failures in New York the Constitution of that State was amended by a vote of the people in 1874, so as to require its legislature by a general law to conform the charters of all savings banks or institutions for savings to a uniformity of powers, rights and liabilities, and require that banks thereafter organized should conform to such general law and amendments made thereto. The organization of savings banks with capital stock was prohibited and the power to pass special charters for banking purposes was taken from the legislature. Trustees of savings banks were prohibited from having any interest, direct or indirect, in their profits or from being interested in any loan or use of any money or property of savings banks with which they were connected. In obedience to the constitutional mandate the legislature of 1875 repealed all special privileges contained in savings bank charters and enacted a stringent and very complete general law for their management, many of the salient features of which have since been engrafted into the laws of other States. As the New York law contains more features common to the laws of all States* a synopsis of its provisions are given.

* In most of the Eastern States savings banks are authorized to invest in bank stock, railroad, and corporation

Savings banks are by law declared to be corporations possessed of the powers and functions of corporations generally and as such may have perpetual succession, sue and be sued, complain and defend in any court of law or equity, appoint such officers, managers, or agents as the business of the corporation requires, provide for the management of its property and the regulation of its affairs, contract and be contracted with, receive money on deposit and invest the same and exercise any additional powers incidental to the business of a savings bank. Not less than thirteen persons can organize, each of whom is required to make a written declaration that he will accept the responsibilities and faithfully discharge the duties of a trustee of the institution if the same shall be authorized by the bank superintendent. This officer has discretionary power in regard to the creating of new banks, being required to determine from the best sources of information at his command, whether greater convenience of access to a savings bank will be afforded to any considerable number of depositors by opening a bank at the place designated, and if the density of the population in the neighborhood and in the surrounding country is such as to afford a reasonable promise of adequate support to the enterprise, and also whether the responsibility, character, and general fitness for the discharge of the duties appertaining to such a trust of the persons named as trustees are such as to command the confidence of the community in which the savings bank is proposed to be located. On authority to transact business being granted the persons designated as trustees have the entire management and control of the affairs of the corporation. Residents of the State alone are eligible as trustees, and whenever a trustee of one bank becomes a trustee, officer, clerk, or employé in any other savings bank, or upon borrowing, directly or indirectly, any of the funds of the bank of which he is a trustee, or becoming a surety or guarantor for money borrowed of or a loan made by the bank, or upon failure to attend regular meetings of the board or to perform any duties devolved upon him as a trustee for six successive months, without having previously been excused by the board, his office becomes vacant. But in the discretion of the board such trustees are eligible for re-election. The board of trustees elect from their number a president and two vice-presidents; and from their number or otherwise, elect or appoint such officers and clerks, whose salaries are fixed by the board, as they may see fit. Vacancies in the office of the trustee are filled by the board, which has power from time to time to make such by-laws, rules, and regulations as may be thought proper for the election of officers, for prescribing their respective powers and duties and the manner of discharging the same; for the appointment and duties of committees, and generally for transacting, managing, and directing the affairs of the corporation. Regular meetings of the board of trustees are required to be held as often as once in each month, at which at least seven trustees must be present. Trustees are prohibited by law from having any interest whatever, direct or indirect, in the gains or profits of their banks, or from, directly or indirectly, receiving any pay or emolument for their services, except that trustees acting as officers, whose duties require and receive their regular and faithful attendance at the bank, may receive such compensation as in the opinion of a majority of the board of trustees shall be just and reasonable; such majority to be exclusive of any trustee to whom compensation is voted; but it is not lawful to pay trustees, as such, for attendance at board meetings. No trustee or officer, for himself or as

stocks and bonds, bonds of cities, and personal securities. In some few States the banks deal in commercial paper.

the agent or partner of others, can borrow the funds or deposits of the bank, or in any manner use the same, except to make current and necessary payments authorized by the board of trustees, nor can any trustee or officer become an indorser or surety, or in any manner an obligor for moneys loaned by or borrowed of his bank.

Savings banks are authorized by law to receive on deposit such sums of money as may be offered by individuals, corporations, or societies; invest the same and pay interest or dividends thereon. On making first deposit, banks furnish to each depositor a pass-book in which all deposits and withdrawals are required to be entered. Such pass-book contains the rules and regulations of the bank, and is legal evidence between the corporation and the depositor as to the terms on which the deposit is made. The sums deposited together with accumulations are required to be repaid to depositors or their legal representatives, after demand, in such manner and at such times and after such previous notice, and under such regulations as the board of trustees may prescribe. The usual provision is for sixty days' notice, which is only demanded in time of panic to allay excitement. While depositors are not restricted as to the number of banks with which they may have accounts, the aggregate amount a single bank can hold to the credit of an individual is limited to \$3000. Such limitation does not apply to deposits made by order of a court of record or a surrogate. Banks may refuse to receive deposits, or at any time return all or any portion thereof. Deposits made by minors or females are held for their exclusive benefit, free from the control or lien of all persons whatsoever, except creditors.

It is made the duty of trustees to regulate the rate of interest or dividends on deposits not to exceed 5 per cent. *per annum*, in such manner that depositors shall receive, as nearly as may be, all profits of the corporation after deducting necessary expenses, and reserving such amount as may be deemed expedient, as a surplus fund for the security of depositors, which to the amount of 15 per cent. of deposits they are authorized to gradually accumulate and hold, to meet any contingency or loss in business from the depreciation of securities or otherwise. When surplus exceeds 15 per cent. of deposits extra dividends may be declared. Savings banks are prohibited from declaring, crediting, or paying dividends or interest except on authority of a vote of the board of trustees. When dividends are declared and credited in excess of the earnings of a savings bank, trustees voting therefor are jointly and severally liable to the bank for the excess so declared.

The securities in which investments may lawfully be made are stocks or bonds or interest-bearing notes or obligations of the United States, or those for which its faith is pledged; 3.65 bonds of the District of Columbia; interest-bearing stocks or bonds of the State of New York and those issued by cities, counties, towns, or villages thereof, and the stocks or bonds of any State in the Union that has not, within ten years, defaulted in the payment of any part of either principal or interest of any debt authorized by any legislature of such State to be contracted. In bonds and mortgages on unincumbered real estate, situate in the State, and worth, at least, twice the amount loaned thereon, but not to exceed 60 per cent. of deposits can be so loaned. In case the loan is on unimproved and unproductive real estate the amount is restricted to 40 per cent. of actual value. No loan on bond and mortgage can be made except upon the report of a committee charged with the duty of investigating the same, who certify the value of the premises according to their best judgment, which report is filed and preserved among the records of the institution.

Trustees are required to invest the moneys de-

posited with them, in the securities enumerated, as soon as practicable, except that, for the purpose of meeting current payments and expenses in excess of receipts, there may be kept an available fund of not exceeding 10 per cent. of the whole amount of deposits, which may be kept on hand, or on deposit with banks or trust companies to an amount not exceeding 25 per cent. of their paid up capital and surplus; or such available fund or any part thereof may be loaned on the pledge of such securities as savings banks are by law authorized to invest in. The real estate that they may hold and convey is such as may be requisite for a banking-house, the cost of which is limited to 50 per cent. of the surplus of the bank, and such as may be purchased at sales upon foreclosure of mortgages owned by the bank, or upon judgments or decrees obtained for debts due to it or in settlements effected to secure such debts.

Trustees are prohibited from loaning the moneys deposited with them, upon notes, bills of exchange, drafts, or other personal securities, and it is unlawful for savings banks to deal or trade in any goods, wares, merchandise, or commodities whatever, except as expressly authorized; or in any manner to

buy or sell exchange, gold or silver, or to collect or to protest promissory notes, or time bills of exchange. And no savings bank can lawfully make or issue any certificate of deposit, payable either on demand or at a fixed day, nor pay any interest except regular quarterly or semi-annual dividends upon any deposits or balances, nor pay any interest or deposits, or portion of a deposit, or any check drawn upon itself by a depositor, unless the pass-book of the depositor be produced, and the proper entry be made therein at the time of the transaction.

Every savings bank is required to make a full report in writing of its condition at least twice in each year, verified by the oaths of the two principal officers of the bank. The reports made for January and July are based on examinations of assets and liabilities made by a committee of not less than three trustees; the accuracy of the examinations is required to be verified by the oaths of the trustees making the same. An accurate balance of the depositors' ledgers is also required to be taken semi-annually, and if there be discrepancies between them and the general ledger of the bank the fact must be stated in the semi-annual report.

TABLE II.—684 SAVINGS BANKS, 1886-87.

RESOURCES.		LIABILITIES.	
Loans on real estate.....	\$457,441,606	Capital stock paid in	\$10,090,866

* Estimated.

The bank superintendent makes annual reports to the legislature of the condition of all of the savings banks in operation in the State; he also, at

least once in two years, either personally or by some competent person, visits and examines each savings bank transacting business in the State. The super-

Intendent may cause special examinations to be made whenever he deems it necessary or expedient. On such examinations, persons whose testimony is required may be compelled to appear and testify. If at any time it appears to the superintendent, from examinations or reports, that any savings bank has committed a violation of its charter or of law, or is conducting business in an unsafe or unauthorized manner, he is required to direct the discontinuance thereof, and whenever such corporations refuse or neglect to comply with his order, or whenever it appears that it is unsafe or inexpedient for any such corporation to continue to transact business, or that any trustee or officer of a savings bank has abused his trust, or been guilty of misconduct or malversation in his official position injurious to the bank, or to its depositors, the superintendent communicates the facts to the attorney-general, who institutes such proceedings as the nature of the case requires. The proceedings instituted by the attorney-general may be for the removal of one or more of the trustees, or for the transfer of the corporate powers to other persons, or the consolidation and merger of the corporation with any other savings bank that may be willing to accept of the trust, or for such other relief or correction as the particular facts communicated to him shall seem to require. In the event of a savings bank being put into liquidation, its assets are required to be distributed within eighteen months. The advertising as savings banks, by individuals or corporations, without lawful authority, is prohibited under heavy penalties.

In Table II. are given the aggregates of the several items of resources and liabilities of the savings banks throughout the United States in 1886 and 1887, as shown by the most reliable data obtainable from both official and unofficial sources. (E. A. W.)

SAXE, JOHN GODFREY (1816-1887), wit and poet, was born at Highgate, Vt., June 2, 1816. He graduated at Middlebury College in 1839, became a lawyer, and in 1851 was made State attorney at Burlington, where he also conducted a Democratic newspaper until 1858. He was in much request as a lecturer, especially at college commencements and before literary societies. For these occasions his longer poems were specially adapted, while his mirth-provoking shorter ones appeared in the *Knickerbocker Magazine* and various journals. From them collections were made: *The Money King and other Poems* (1860); *Clever Stories of Many Nations* (1863); *The Masquerade* (1866); *Fables and Legends of Many Countries* (1872); *The Proud Miss McBride* (1873); *Leisure Day Rhymes* (1875). Editions of his *Complete Works* followed; but the poet who once was able to evoke mirth from the gravest themes became a victim to confirmed melancholy. He lived in seclusion at his son's house, in Albany, refusing to receive any company, and died there, March 31, 1887.

SAY, THOMAS (1787-1834), naturalist, was born at Philadelphia, July 27, 1787. He was the son of a druggist and was trained in the same business, but injudicious indorsements caused the failure of his firm. When the Academy of Natural Sciences was formed in his native city, in 1812, he was made curator and devoted himself with such ardor to scientific investigation that he grudged to spend time in eating. In 1818, he joined Maclure and others in exploring the islands and coast of Georgia and Florida, until hostilities with the Indians interrupted the work. Say was chief geologist in Major Long's exploring expeditions, the first in 1819-20, to the Rocky Mountains, to the second, in 1823, to the sources of St. Peter's River, now called the Minnesota. Robert Owen drew Say and Maclure into his socialist scheme at New Harmony, Ind., in 1825. They were to conduct a university for the scientific training of the community. The entire experiment

failed within two years, but Say remained as the agent of the property, and died there, Oct. 10, 1834. His chief work is *American Entomology* (Phila. 3 vols. 1825; new ed. by Leconte, 1859). Of his *American Conchology*, only a few numbers were issued. A list of his scientific articles is given in the *American Journal of Science*, vol. 27.

SAYCE, ARCHIBALD HENRY, English orientalist, was born at Shirehampton, Sept. 25, 1846. He was educated at Grovesnor College, Bath, and Queen's College, Oxford, when he graduated and became fellow in 1869, and tutor in 1870. He took orders but continued his college work, and in 1876 was made deputy professor of comparative philology. He took part in the English revision of the Old Testament, from 1874 till 1884. Besides numerous articles relating to Assyriology and kindred subjects he has published *Principles of Comparative Philology* (1874); *Astronomy and Astrology of the Babylonians* (1874); *Introduction of the Science of Language* (2 vols. 1880); *Monuments of the Hittites* (1881); *Cuneiform Inscriptions of Van* (1882); *Ancient Empires of the East* (1884); *Fresh Light from the Monuments* (1884); *Introduction to Ezra, Nehemiah, and Esther* (1885); *Assyria; its Princes, Priests, and People* (1886).

SCAMMELL, ALEXANDER (1747-1781), colonel in the American Revolutionary army, was born at Mendon, now Milford, Mass., March 24, 1747. He was the son of a physician of English birth, and graduated at Harvard in 1769. He taught school and assisted in surveying for Holland's map of New Hampshire. He had commenced the study of law with John Sullivan, and when the latter was made brigadier-general in 1775, Scammell became his brigade major, and served in the siege of Boston and on Long Island. In 1776 he was made colonel of the Third New Hampshire Regiment, and fought at Trenton, Princeton, and Saratoga, being wounded at the last. He was then made adjutant-general of the army, but in 1781 he resumed service as colonel. At the siege of Yorktown he was surprised while reconnoitering, and after surrendering was wounded so that he died at Williamsburg, Oct. 6, 1781.

SCARLET FEVER. See FEVER.

SCHAFF, PHILIP, a native of Switzerland, master of German theology, has become a foremost representative of American Protestantism. He was born at Coire, Jan. 1, 1819, and was educated at Stuttgart, and at the Universities of Tübingen, Halle, and Berlin, receiving from the last the degrees of Ph.D. in 1841. During his early college life he travelled extensively on the continent, and in 1842 he began to lecture on theology at Berlin. About that time the German Reformed Church of the United States was seeking to obtain closer contact with the life and thought of the Evangelical Churches of Continental Europe. For this purpose the study of German philosophy and theology was promoted and an effort was made to obtain from Germany a thoroughly trained expounder of those branches. Neander, Hengstenberg, Tholuck, and others, whose advice was asked, concurred in recommending the young lecturer, and he was accordingly called in 1843 to the professorship of church history and exegesis in the Theological Seminary at Mercersburg, Pa. After some months spent in travel on the continent and in Great Britain, he sailed for America and entered on his new work. In the Seminary and in Marshall College, with which it was closely connected, Rev. John W. Nevin, D.D., was the chief director. Prof. Schaff became an efficient coadjutor, teaching in both Seminary and College, and contributing valuable articles to the *Mercersburg Review*, which they started in 1849. His first separate publication was *The Principle of Protestantism* (1845), which had been written in German, and was translated into English, with an

introduction by Dr. Nevin. In opposition to the extreme individualism which had prevailed in the New England Churches, Prof. Schaff insisted on the historic development of the Church, as an organism. His views provoked a controversy even in the German Reformed Church, and he was tried for heresy but acquitted. His *History of the Apostolic Church* (1851), appeared first in German, was soon translated into English, and finally expanded into his valuable *History of the Christian Church* (6 vols., 1859-88). Meantime had appeared his *Life and Labors of St. Augustine* (1853), and numerous essays and articles, by no means confined to theology. In 1854 Prof. Schaff paid a visit to his friends in Europe, and received from his Alma Mater the degree of D. D. He took occasion to publish for the benefit of Germans, *America: The Political, Social, and Religious Condition of the United States* (Berlin, 1854). This was translated into English, and after his return he prepared a somewhat similar book on *Germany: its Universities, Theology and Religion* (1857), giving graphic sketches of its most prominent theologians. Dr. Schaff's mastery of the department of church history was now universally acknowledged. He was a contributor to several theological quarterlies and to other periodicals. In 1862 he was appointed a lecturer in Andover Seminary, and afterwards in other institutions. In 1863 the seminary at Mercersburg having been closed in consequence of the civil war, Dr. Schaff removed to New York city, which has since been his residence. He was secretary of the New York Sabbath Committee from 1863 to 1869, and visited Europe in 1865 to promote Sabbath observance and Sunday schools. After settling in New York, he joined the Presbyterian Church, and in 1870 was chosen professor of apologetics and symbolics in the Union Theological Seminary. In 1872 he was transferred to the chair of Hebrew, and in 1875 to that of sacred literature. He was the chief American organizer of the Evangelical Alliance and superintended the arrangements of its meeting in New York city in 1873. He was also a delegate to its conferences at Basle in 1875, and at Copenhagen in 1884. In like manner he took part in forming the Alliance of the Reformed Churches in 1875, and he has been prominent at its meetings at Edinburgh (1877), Philadelphia (1880), Belfast (1884), and London (1888). This Alliance is often called the Presbyterian Alliance.

In 1865 there appeared under Dr. Schaff's editorial supervision the first volume of an American revised and enlarged edition of Dr. J. P. Lange's *Commentary on the Bible*. In this edition twenty prominent American scholars contributed to improve the elaborate original. Such was the value of their labors that this work was accepted in England as the standard translation. The association thus exhibited in Biblical work easily prepared the way for the organization of an American committee to assist in revising the English version of the Bible. This work was commenced in 1871, and successfully and harmoniously completed under the direction of Dr. Schaff, who published an *Introduction on the Revision of the Bible* (1873). The Revised Version of the New Testament was issued simultaneously in May, 1881, in England and America; the Old Testament was similarly issued in 1885.

Another notable work by Dr. Schaff is *The Creeds of Christendom* (3 vols., 1877), being a collection of the authorized symbols and confessions of the principal Christian Churches, with notes and introduction. In his efforts to popularize the latest results of German research, Dr. Schaff became editor of an American edition of the *Religious Encyclopedia*, prepared by Drs. Herzog and Piitt. This was translated, revised, and condensed, while extensive articles pertaining to American topics were added. The whole was published under the title, *The Schaff-*

Herzog Dictionary of Religious Knowledge (3 vols., 1884). A supplemental volume, giving biographical sketches of living divines, has since been issued (1887).

Besides the various works already mentioned, Dr. Schaff has prepared collections of hymns, both German and English; *Christ in Song* (1868), an illustrated *Bible Dictionary* (1880), and with Arthur Gilman, a *Library of Religious Poetry* (1881). In 1886 he became editor of the *Select Library of the Nicene and Post-Nicene Fathers*, to be completed in 25 volumes. In his prodigious literary activity he has been assisted by various helpers, notably Rev. S. M. Jackson, and his son, Rev. D. S. Schaff.

(J. P. L.)

SCHAUFFLER, WILLIAM GOTTLIEB (1796-1883), missionary, was born at Stuttgart, Württemberg, Aug. 22, 1798, but was taken by his father to Odessa in childhood. In 1826 he was taken by Rev. Joseph Wolff, Constantinople, to be prepared for missionary work. Afterwards he went to America and studied theology at Andover. Being appointed a missionary of the American Board in 1831, he returned to Constantinople and there devoted himself with the utmost diligence to mission work, including the translation of the Bible into the Osmanli-Turkish dialect. He was conversant with nineteen languages, and able to preach in several of them. His scholarship and labors obtained for him degrees from German and American universities. He died at the residence of his son in New York city, Jan. 26, 1883.

SCHIEFFEL, JOSEPH VICTOR VON (1826-1886), German poet, was born in Karlsruhe, Baden, Feb. 16, 1826. He was educated in the Lyceum of that city and afterwards studied science, philology, and literature in Munich, Heidelberg, and Berlin. From 1848 to 1852 he was referendary at Sackingen, and then abandoning the service of the State, spent 1852-53 in Italy. Later, he lived occasionally in Munich and Heidelberg. For a time he was librarian to the Prince of Fürstenberg, at Donaueschingen, and he also enjoyed the patronage of the Grand-Duke Alexander of Weimar. From 1866 till his death in Karlsruhe, April 9, 1886, he lived partly in that city and partly on his estate near Radolfzell on the Lake of Constance.

His first greatly successful epic poem—*The Trumpeter of Sackingen*—had its origin in 1853, in Sorrento, on the island of Capri, where he lived in friendly intercourse with Paul Heyse. His *Poems* (1886), illustrated by A. von Werner, comprise fresh German and Italian genre pictures and cabinet-pieces recalling the humor of Hoffmann. The historical romance *Ekkehard* (Frankfort, 1855; Stuttgart, 1886, illustrated by von Werner), as well as the novel *Juniperus, the History of a Crusader* (Stuttgart, 1833), present vivid pictures of mediæval life. His collection of poems, *Frau Aventure, Songs of the time of Heinrich von Oesterdingen*, seems like an echo of the old German minnesingers, while his *Gaudeamus, Songs from far and near*, delight by their genial humor and strike the genuine popular note. Other productions are his *Bergsamen*; *Waldeinsamkeit*, and *Waltarilied Verdeutsch*. Schieffel was an original poet, not free from mannerism, but of sound judgment and genuine fancy. In 1876 the Grand Duke of Baden made him a hereditary noble.

SCHEM, ALEXANDER JACOB (1826-1881), encyclopedist, was born in Widenbrück, Westphalia, March 16, 1826. He was educated at the Universities of Bonn and Tübingen, and was ordained in the Roman Catholic Church. Having become a Protestant, he emigrated to the United States in 1851, and was made professor of modern languages in Dickinson College in 1854. Having become a contributor to Appleton's *New American Cyclopædia*

in 1859, he removed to New York, and was there diligently employed in editing and contributing to newspapers and encyclopædias until his death at West Hoboken, N. J., May 21, 1881. From 1874 he had been also assistant superintendent of public schools for New York city, and with Henry Kiddle he edited the *Cyclopædia of Education* (1877).

SCHENCK, ROBERT CUMMING, general, was born at Franklin, Ohio, Oct. 7, 1809. His father served as an officer in Gen. Harrison's army. He graduated at Miami University in 1827, and became professor there. After being admitted to the bar he settled at Dayton, and was soon elected to the legislature. In 1843 he was elected to Congress as a Whig, and gained reputation for his pungent speeches. In 1851 he was sent as U. S. minister to Brazil. After his return he practised his profession until the outbreak of the civil war, when he was commissioned brigadier-general of volunteers. In June, 1861, while his command were being transported by railroad to Vienna, Va., they were fired upon and sustained severe loss. Gen. Schenck was engaged at Bull Run, and served in West Virginia, and in the Shenandoah Valley. At the second battle of Bull Run, he commanded a division and had his right arm shattered by a rifle ball. He was promoted major-general, Sept. 18, 1862, and appointed to the command of Baltimore, which he protected during Lee's invasion of Pennsylvania. In 1863 he returned to Congress and took a prominent part throughout the reconstruction period. He was latterly chairman of the committee of ways and means. In 1871 he was sent as U. S. minister to England and discharged his diplomatic duties well, but on the failure of a silver-mining company in which he was a director he resigned in 1876, and afterwards practised law at Washington.

SCHENECTADY, a city of New York, county-seat of Schenectady co., is on the south bank of the Mohawk River, 17 miles N. W. of Albany. It is on the N. Y. Central, the Albany and Susquehanna, and the Rensselaer and Saratoga railroads, and on the Erie canal. It is the seat of Union College, now enlarged into Union University by the addition of law and medical schools at Albany. (See UNION UNIVERSITY.) Schenectady has a city hall and court-house, a national bank and other banks, 2 high schools, 20 churches, 2 daily and 4 weekly newspapers. Its industrial works comprise woolen and flour mills, machine and boiler shops, locomotive works, stove foundries, broom factories, and other manufactures. It was an Indian trading post in 1620, and was chartered in 1684. As a frontier settlement, it was a place of interest in the French and Indian War, and in the Revolution. In 1798 it was made a city. In 1880 its population was 13,655.

SCHENKEL, DANIEL (1813-1885), a Swiss theologian, was born at Dägerlen, near Zurich, Dec. 21, 1813. He studied theology at Basel and Göttingen, his instructors being De Wette, Hagenbach, Gieseler, and Lücke. He began to lecture at Basel in 1837, and in 1841 was made pastor at Schaffhausen. Upon the death of De Wette in 1849, Schenkel, who was his closest follower in spirit and method, was chosen to succeed him as professor of theology at Basel, but in 1851 he was called by the grand-duke of Baden to be chief university preacher and church councillor. His noted work, *Das Wesen des Protestantismus* (3 vols. 1846-51), while aiming at a reconciliation of modern rationalist criticism with the spirit of the Reformation, yet marked a wide departure from the orthodox theology and its views of the inspiration of the Scriptures. Schenkel contributed to Lange's *Biblical commentaries* on Ephesians, Philippians, and Colossians, but as he swerved more widely from orthodoxy, this place was afterwards supplied by Dr. Braune's commentaries. Schenkel also edited

the *Allgemeine Kirchenzeitung*, and strenuously supported the liberal movement both in theology and in church constitution. He endeavored to introduce the congregational principle into the Hessian Church. Schenkel's free thinking culminated in his *Das Charakterbild Jesu* (1864), which passed through several editions, but against which 118 pastors in Baden published a protest. In reply Schenkel issued *Die protestantische Freiheit in ihrem gegenwärtigen Kampfe mit der kirchlichen Reaktion* (1865). He was one of the most active promoters of the Protestantenverein (for which see *ENCYCLOPEDIA BRITANNICA*). This movement he advocated in *Christenthum und Kirche in Einklang mit der Kulturentwicklung* (1867) and various other publications. At the approach of the Vatican Council Prof. Schenkel was vigorous in his denunciation of the new pretensions which were proposed to be put forth by the Roman Church and its head. At the great Protestant reunion at Worms Schenkel was the chief orator and his report was adopted by 20,000 adherents. The most important of Schenkel's literary labors was his *Bibel-Lexikon* (1867-75), in which he was aided by a numerous corps of scholars. Among his later works was *Das Christusbild der Apostel und der nachapostolischen Zeit* (1875). He was always an active contributor to periodicals, and he published many pamphlets on theological and polemic subjects. After a long illness he died at Heidelberg, May 20, 1885.

SCHIERER, EDMOND HENRI ADOLPHE, French liberal theologian and journalist, was born at Paris, April 8, 1815. His father was a Swiss by birth and a banker by profession. The son studied at the Collège Bourbon, spent two years in England, and after his return studied law at Paris and theology at Strasburg. He was appointed professor of exegesis at Geneva in 1845, but when his views of the inspiration of the Bible changed, resigned his post and published *La Critique et la Foi* (1850). Then he became a leader of the liberal party in the French Reformed Church. After the overthrow of the Empire he entered into political life and was elected to the national assembly in July, 1871. He was a leader among the republicans and endeavored to promote the union of their various groups. He was active in his efforts against the ministry of the Duc de Broglie and assisted in effecting its overthrow. He was a correspondent of the *London Daily News* and a regular contributor to *Le Temps* until 1879, when he withdrew on personal grounds. He was also connected with Colani's *Revue de Théologie et de Philosophie chrétienne*. From his contribution to periodicals he gathered *Mélanges de Critique religieuse* (1860), which passed through several editions. He also published *Alexandre Vinet* (1853; *Études critiques sur la littérature contemporaine* (5 series, 1863-78); *Mélanges d'histoire religieuse* (1864).

SCHIAPARELLI, GIOVANNI VIRGINIUS, Italian astronomer, was born at Savignano, March 5, 1835. He pursued mathematical studies at Turin until 1856, when he went to Berlin and afterwards to Pulkowa for observatory work. In 1860 he was employed in the observatory at Milan and in 1862 was made director there. His work has given him high rank among living astronomers. He has discovered an asteroid, and has published treatises on comets and various stars, on the planet Mars and some satellites. He has also published an historical work on *The Precursors of Copernicus in Antiquity* (Milan, 1873).

SCHLATTER, MICHAEL. See REFORMED CHURCH IN THE UNITED STATES.

SCHLIEMANN, HEINRICH, archæological explorer, was born Jan. 6, 1822, at Neu-Buckow in Mecklenburg-Schwerin. His father was a poor clergyman, and the son leaving school at the age

of 14 was apprenticed to a shopkeeper in Fürstenberg. At the end of five years overwork had rendered him useless to his master, and he went to Hamburg. He obtained a place as cabin-boy on a ship bound for Venezuela, but the ship was wrecked on the island Texel, and the unfortunate youth was sent to hospital at Amsterdam. In this city he obtained mercantile employment and diligently improved his leisure in the acquirement of modern languages. After he had learned Russian, his employers sent him to St. Petersburg, where he spent eleven years in business. Having learned Modern Greek, he took up the study of the ancient language and was soon enraptured with Homer. In 1858 he set out on travels which extended through Sweden, Denmark, Germany, Italy, Egypt, Syria, and Greece. In 1863 he resumed his business activity intending to acquire the means of devoting himself to Greek archaeology. In 1864 he set out on a journey around the world which was completed in 1866, and furnished material for his first publication. Two years later he went to Greece and Asia Minor to visit the scenes of Homer's poems. He had married a Greek lady, who had attracted him by her devotion to the same poet, and her sympathy and assistance were of great benefit to his researches. Having come to the conclusion that the site of ancient Troy was at Hisarlik, he determined in 1870 to explore the place. He employed 150 laborers, whose excavations revealed the ruins or traces of no less than six successive settlements. One of these, which had been burnt, he pronounced Homeric Troy. Treasure enough was obtained to repay all the outlay, but the greater part has been deposited in the Schliemann Museum, a part of the Ethnological Museum in Berlin. The publication of his researches provoked great controversy, as classical scholars had generally been adverse to admitting Hisarlik as the site of Troy. But the positive results of his explorations were too great to be gainsaid. In 1876 he undertook the exploration of the site of Mycenæ, and obtained from its tombs an enormous amount of treasure. Again in 1881-82 he excavated the treasury of Orchomenos, and discovered many remains of prehistoric art. Finally in 1884-85 he explored in the same way the site of Tiryns and brought to light the prehistoric palace of its kings. These discoveries were set before the world in a succession of splendid volumes, of which may be mentioned here *Trojanische Alterthümer* (with atlas, 1874); *Mycenæ*, with introduction by Gladstone (1878); *Ilios*, with introduction by R. Virchow (1881); *Orchomenos* (1881); *Troja*, with introduction by A. H. Sayce (1883); *Tiryns*, with introduction by F. Adler and essays by W. Dörpfeld (1886). Most of these issued simultaneously in English, French, and German. Among the marks of honor bestowed on Schliemann were the degree of doctor of philosophy by the University of Rostock in 1869, the degree of doctor of civil law by the University of Oxford in 1883. He has since 1871 resided chiefly at Athens.

SCHMUCKER, SAMUEL SIMON (1790-1873), Lutheran minister, was born Feb. 28, 1799, at Hagerstown, Md., where his father, Rev. John G. Schmucker, D.D., was pastor. He studied theology and in 1820 was ordained pastor of a church at Newmarket, Va. In 1826 he was made president of the theological seminary, then begun at Gettysburg, and held this position until the institution was closed by the civil war. He died July 26, 1873. He contributed to theological reviews and published several works on Lutheranism and other subjects. His son SAMUEL MOSHEIM SMUCKER (1823-1863) became a Lutheran clergyman, then a lawyer and finally a prolific author of popular biographies and similar books. Another son, BEALE MELANCHTHON SCHMUCKER (1827-1888), succeeded to his

father's denominational activity and prominence. He held pastorates at Martinsburg, Va., Allentown, Easton, Reading, and Pottstown, Pa. He was one of the founders of the Lutheran General Council in 1867, and devoted much attention to the liturgy and hymnology of the church.

SCHNAASE, KARL (1798-1875), German art-historian, was born at Dantzic in 1798. After studying philosophy and jurisprudence at the University of Heidelberg, he made a tour in Germany, in the course of which the art-gallery of Dresden awakened his innate love for the fine arts. After having filled several offices in Dantzic and Königsberg, he set out, in 1825, for Italy and there became deeply interested in the study of the architectural *chefs-d'œuvre* of the middle ages and antiquity, the history of which, in after-life, occupied all the hours he could spare from his public administrative functions. He was appointed assessor at Königsberg, 1826, councillor of the superior provincial court of Marienwerder, 1829, councillor of the High Court of Berlin, 1845, from which last office he retired into private life in 1857. Among his numerous works are *Letters from the Netherlands* (Stuttgart, 1834), in which he treats the study of art from a historical and philosophical point of view; the Introduction to the work of Schwantaler, entitled *The Crusade of Frederick Barbarossa* (1840); *History of the Fine Arts* (Düsseldorf, 7 vols., 1843-1864; 2d ed., 1866), the last being his most important work. Beside this he has been one of the most active collaborators on the *German Art Magazine*, and the *Art Magazine* of Tübingen. In 1858 he founded the *Journal of Christian Art*, which he edited for many years in conjunction with Grunewald and Schnorr von Carolsfeld. In 1867 he settled in Wiesbaden and died there May 20, 1875.

SCHOFIELD, JOHN MCALLISTER, major-general, was born in Chautauque co., N. Y., Sept. 29, 1831. He graduated at West Point in 1853 and was professor of natural philosophy there until 1860, when he took a similar position in Washington University, St. Louis. When the secession movement began in Missouri, he was appointed major of the First Missouri Volunteers and was chief of staff to Gen. Nathaniel Lyon until the death of that commander. Schofield was commissioned brigadier-general in November, 1861, and had command in Missouri. He was commissioned major-general of volunteers Nov. 29, 1862, but remained west of the Mississippi until January, 1864. He was then placed in command of the Army of the Ohio, relieving Gen. J. G. Foster who had been holding Knoxville, Tenn. He led the 23d Army Corps in Gen. Sherman's campaign, taking part in most of the fighting until the capture of Atlanta in September. In November he was sent in pursuit of Gen. J. B. Hood, who had left Georgia to invade Tennessee and capture Nashville, which was held by Gen. G. H. Thomas. After some fighting along the road Schofield defeated Hood's army at Franklin, Tenn., Nov. 30, and joined Thomas. For this service he was made brigadier-general in the regular army. After Hood's army was dispersed, Schofield in 1865 was ordered to Annapolis, Md., and thence sent by sea to North Carolina. He occupied Wilmington Feb. 22, fought again at Kingston and joined Gen. Sherman at Goldsboro March 22. When Gen. J. E. Johnston surrendered his command, Gen. Schofield was appointed to carry out the terms of the convention. He had command of the military district of Virginia 1866-67. When the attempted impeachment of President Johnson had failed, in May, 1868, Stanton was obliged to resign his position as Secretary of War, and the President appointed Gen. Schofield Secretary *ad interim*. The position had just been the object of a fierce conflict between the

President and Congress, but Schofield accepted and discharged the dangerous duty in such a masterly way as to offend neither party. He retired when Gen. Grant was inaugurated in 1869 and was promoted to be major-general U. S. A. He was assigned to the department of Missouri, but a year later was transferred to the division of the Pacific. In July, 1876, he was made superintendent of the Military Academy at West Point. In 1882 he was again made commander of the Department of the Pacific with headquarters at San Francisco. After the death of Gen. Hancock Gen. Schofield succeeded in April, 1886, to the command of the division of the Atlantic, with his headquarters at Governor's Island, New York harbor. On the death of Gen. Sheridan he became commander of the United States army in August, 1888, but continued at New York until December, when he removed to Washington.

SCHOLTEN, JOHANNES HENDRIK (1811-1885), Dutch rationalist theologian, was born at Leuten, near Utrecht, Aug. 17, 1811. His father was a minister, and his uncle professor in the University of Utrecht. Scholten after a brilliant academical career in that institution received the degrees of doctor of philosophy and of theology and was for some time a pastor at Meerkerk. In 1843 he was made a professor of theology in the University of Leyden and soon gave a remarkable impulse to historical, critical and dogmatic studies not only in the Netherlands, but throughout Europe. He was rector of the University at various times and finally retired in 1881. Among his works are those on the *Doctrine of the Reformed Church* (2 vols., 1848-50); *Historical and Critical Introduction to the New Testament* (1853); *Comparative History of Religion and Philosophy* (1853); *Free Will critically examined* (1859); *The Gospel of John* (1864); *Supernaturalism in relation to the Bible* (1867); *The Pauline Gospel* (1878); and several critical treatises on the four Gospels. On retiring from his professorship he delivered an address reviewing his theological development. He died in 1885.

SCHOMBURGK, SIR ROBERT HERMANN (1804-1865), German-British explorer and naturalist, was born at Freiburg, Prussia, June 5, 1804. He entered on a mercantile career at Leipzig and afterwards removed to Virginia, where he was partner in a tobacco factory, which failed. He went to the island of St. Thomas, W. I., in 1829, and in the next year made a scientific exploration of Aneгада, one of the Virgin Islands. On the publication of his report of this exploration the Royal Geographical Society commissioned him to explore British Guiana. He spent four years in the work, and among other curiosities discovered the great water-lily which he named "Victoria regia." He published a *Description of British Guiana. Geographical and Statistical* (1840); *The Fishes of Guiana* (3 vols., 1841-3), and other books relating to the country. For his *Report* to the Royal Geographical Society he received its gold medal, and to the German translation of it by his brother Otto, Alexander von Humboldt contributed an introduction. Schomburgk was employed on the survey of the boundary between British Guiana and Brazil until 1844, and was knighted soon after. He was appointed British consul and chargé d'affaires in the Dominican Republic in 1848, and in 1857 was sent to Siam as consul general. He retired in 1864, and died at Schöneberg, near Berlin, March 11, 1865. Besides the works already mentioned he published a *History of the Barbadoes* (1847) and *Discovery of Guiana by Sir Walter Raleigh* (1848).

His brother, Moritz Richard Schomburgk, who had assisted in exploring Guiana, went to Australia in 1849, and was made director of the botanical garden at Adelaide in 1865.

SCHOOLS. See COMMON SCHOOLS and EDUCATION.

SCHULZE, FRANZ EITLARD, German zoologist, was born at Eldena, near Greifswald, March 22, 1840. He studied at Rostock and at Bonn, where Max Schultze influenced him. In 1865 he was made professor of comparative anatomy at Rostock and took part in a Prussian scientific expedition to the North Sea. In 1873 he was called to Gatz as professor of zoology, and in 1884 to Berlin, where he was made a member of the Royal Academy. His writings relate chiefly to histology and the development of the lower animals. Among his noted essays are *Die Hautsinnesorgane der Fische und Amphibien* and *Codylphora lucustris* and some on sponges.

SCHULZE-DELITZSCH, HERMANN, German economist, was born at Delitzsch, Saxony, Aug. 29, 1808. He was educated at the Universities of Leipzig and Halle and entered on a judicial career. Devoting his leisure to economical studies he became noted by his efforts for the improvement of the working classes. In 1848 he was elected to the National Assembly at Berlin and was made chairman of a committee of inquiry in regard to their needs. He opposed both the old system of guilds and the Socialistic schemes of State organizations. Instead he advocated self-reliant associations of workmen. Eventually his ideas took shape and gained great popularity. In 1851 he founded the first Credit-Union or People's Bank, whose plan closely resembled that of American building associations (*q. v.*). In 1878 there were in Germany 948 Credit Unions with 480,507 members, while Belgium, France and other countries had many associations of the same kind. Dr. Schulze-Delitzsch has been elected to the Chamber of Deputies at Berlin in 1861, and afterwards to the Reichstag, where he still urged his favorite idea of perfect freedom of association. Among his publications are *Das Associationsbuch* (1862); *Die Arbeitenden Klassen und das Associationswesen* (1863); *Die Vorschuss- und Creditvereine als Volksbanken* (1864); *Die Entwicklung des Genossenschaftswesens* (1870), and treatises on political economy.

SCHURZ, CARL, politician and journalist, was born at Liblar, near Cologne, Prussia, March 2, 1829. He was educated at Cologne and at the University of Bonn. Here in 1848 he conducted a liberal journal, and in the following spring was concerned in an attempt at insurrection. Failing in this he became adjutant of a revolutionary army in South Germany, and after the surrender of Rastadt fled to Switzerland. He afterwards assisted Gen. Kinkel, the leader of the revolt in Bonn, in escaping from Spandau. After a year's residence in London, Schurz came to America in 1852, and spent three years in Philadelphia. In 1855 he removed to Madison, Wisc., and there soon became a political leader. He was active in rousing the German element of that State to opposition to the extension of slavery. In 1857 he was candidate for lieutenant-governor of Wisconsin on the Republican ticket, but was defeated. In the famous campaign in which S. A. Douglas and Abraham Lincoln contended for the U. S. Senatorship for Illinois, Schurz delivered his first political speech in English. Thenceforth he was conspicuous as one of the most effective speakers of the Republican party. In the National Convention of that party at Chicago in 1860 he was influential in shaping the platform adopted. Pres. Lincoln sent him as U. S. minister to Spain, but before the close of 1861 he resigned to enter the army. In April, 1862, he was made a brigadier-general of volunteers and in June he took command of a division in Gen. Sigel's corps. He fought in the second battle of Bull Run, and in the battle of Chancellorsville, where his troops were surprised and routed by "Stonewall" Jackson. At Gettys-

burg and at Chattanooga his division retrieved its reputation. After the war Schurz remained in Washington for a time, and in 1865 was sent by Pres. Johnson on a special tour through the Southern States. His report of their condition showed a general acquiescence in the results of the war. Schurz had now entered on a journalistic career, and after establishing a paper at Detroit, went to St. Louis as editor of the *Westliche Post*. His influence with the German-American element of the population seemed unbounded. In 1869 he became U. S. Senator from Missouri, and though he had been an ardent supporter of Gen. Grant as a candidate for the presidency, he soon joined with Senator Sumner in opposing some favorite measures of the President. Among these was the attempt to acquire Santo Domingo for the United States. An alleged sale of arms to the French nation also became the subject of animadversion. In 1872 the opposition to Pres. Grant's renomination resulted in a Liberal Republican Convention at Cincinnati. Horace Greeley was here nominated for the presidency, though the originators of the movement had preferred Charles Francis Adams. Greeley was endorsed by the Democratic Convention, but was completely defeated. Many members of the Liberal party thenceforth remained with the Democrats, but Schurz in 1876 gave his support to the Republican nominee; and Pres. Hayes called Schurz into the Cabinet as Secretary of the Interior. His administration of this office was marked by energy, integrity and a determination to enforce the laws. His treatment of some Indian tribes, however, provoked adverse criticism. After retiring from this office Schurz was connected with the New York *Evening Post* until a change of proprietorship caused his withdrawal. At this time he declined the offer of a pecuniary testimonial from the admirers of his political course. In 1884 he was again conspicuous for his opposition to Mr. Blaine, the presidential nominee of the Republican party, and was a leader of the "Mugwumps." In 1886 a fall in the street caused him severe injury, from which he but slowly recovered. He afterwards went to Europe, where he had cordial meetings with Prince Bismarck and other political leaders of Germany. Besides his political speeches, which have been widely circulated, he published in the series of *American Statesmen* the best biography of *Henry Clay* (1887).

SCHUYLER, PHILIP (1733-1804), general in the American Revolution, was the great grandson of Philip Pieterse van Schuyler, who emigrated from Holland and settled at Albany, N. Y., in 1650. Members of his family were prominent in Indian affairs and held various local offices. Philip was born at Albany, Nov. 22, 1733. He inherited from his father and uncle large estates, and his wealth was increased by his marriage with Catharine Van Rensselaer. He was early employed in military affairs; in 1755 he was captain in an expedition to Crown Point; in 1756 he was major and commissary to the expedition to Oswego; in 1758 he had similar duties in the expedition for the invasion of Canada. Before the close of that war he visited England, being captured on the voyage by a French privateer, but released by a British frigate. Afterwards he was a member of the colonial assembly and he took part in the disputes respecting Vermont. When the conflict with Great Britain began Schuyler took the patriotic side. Such was his prominence that in 1775 Congress first appointed him as Gen. Washington's associate in prescribing the regulations for the American army, and a few days later commissioned him as major-general with command of the Northern Department. He set out for the invasion of Canada by way of Lake Champlain, but in September was compelled by ill health to return to

Albany while Montgomery went on to meet his fate at Quebec. Schuyler's withdrawal gave rise to charges against his loyalty, and when Congress sent Gen. Gates to be his associate in command, he offered his resignation, but it was not accepted. Then he demanded a court of inquiry, which was granted. The court approved Schuyler's conduct, but did not advise the removal of Gates. Schuyler then had himself chosen to Congress in 1777, and pleaded his cause in person with such effect that he was restored to full command. He set out from Albany to oppose Burgoyne's invasion, but found that St. Clair had already been forced to abandon the strong fortress of Ticonderoga, and had to return. A fiercer clamor now arose against Schuyler, especially from New England, which was now open to attack. Congress, yielding to the pressure, sent Gates to supersede him. But Schuyler, thoroughly acquainted with the country and trusted by its inhabitants, was then using every exertion to prepare suitable defence by rallying the troops and erecting fortifications. His earnest patriotism was still more signally displayed in his giving to his rival the full benefit of his services. He was present at Burgoyne's surrender, which his own wise arrangements had greatly helped to bring about. During the following winter another court of inquiry approved his conduct, but in April, 1779, after he had been elected a member of Congress, he resigned from the army. He aided the public treasury by liberal advances from his private resources. From 1780 to 1784 and again from 1786 to 1790 he was a State Senator. In 1789 the New York legislature elected him to the U. S. Senate for two years, after which he returned to the State Senate. In 1797 he was again elected U. S. Senator, but was unable to serve on account of ill health. He died at Albany, Nov. 18, 1804. Though Gen. Schuyler's military career was marked by various misfortunes, he always had the confidence of Washington. See *Lossing's Life and Times of Philip Schuyler* (1872).

SCHWATKA, FREDERICK, explorer, was born at Galena, Illinois, Sept. 29, 1849. He graduated at West Point in 1871, but soon resigned from the army, studied law and was admitted to the bar in New York in 1875. Still not satisfied with his acquirements he studied medicine and received his degree in 1876. In June, 1878, he sailed to the Arctic regions in command of a Franklin search expedition, and returned in Sept. 1880, having discovered and buried the skeletons of several members of Sir John Franklin's party. In 1884 he explored the great river Yukon in Alaska.

SCHWEIFURTH, GEORGE AUGUST, German explorer and naturalist, was born at Riga, Sept. 29, 1836. Educated there and at the University of Heidelberg, he devoted himself to the study of botany, and made scientific excursions in Russia, France and Italy. In 1863 he resolved to visit Central Africa by way of Khartoum, and returned thence in 1866 with rich collections of natural history. With the approval of the Berlin Academy, he started again in 1869 with the escort of an ivory trader and the favor of the governor-general of Soudan. He explored the country of the Dinkas, Bongos, Niam-Niam and Moubuto, and discovered the Akkas, a pygmy race. In Dec. 1870, he lost by fire his baggage, instruments and journal, but his collections had been previously transmitted to Europe. He arrived at Suez in Aug. 1871, and was received in Germany with great enthusiasm. In 1873-74 he explored the great oasis in the Libyan desert and was appointed by the Khedive director of the museum of natural history at Cairo. In 1876-78 he explored the country between the Nile and the Red Sea, and in 1881 took part in an exploration of the island of Socotra. He has since been engaged in promoting German colonization in

equatorial Africa. He has published *Im Herzen von Africa* (1870), translated into English under the title *The Heart of Africa*. He also published many botanical treatises before and since his African explorations, and a valuable map of Dr. W. Junker's travels in those regions (1887).

SCHWEINITZ, EDMUND ALEXANDER DE (1825-1887), Moravian bishop, was born at Bethlehem, Pa., in 1825. He was educated in that town and at the University of Berlin. After being ordained to the ministry he settled in Philadelphia as pastor of a church, and also edited the *Moravian*, a weekly paper. He also published *The Moravian Manual* (1859); *The Moravian Episcopate* (1865); a *Life of Zeisberger* (2 vols. 1870), and a *History of the Unitas Fratrum* (1884). In 1870 he was made bishop and president of the Northern Conference of the Moravian Church in America. He died at Bethlehem, Dec. 18, 1887.

His uncle, LEWIS DAVID VON SCHWEINITZ (1780-1834), was also a Moravian minister, but was noted chiefly as a botanist. He was born at Bethlehem, Pa., and received his early education there. In 1798 he went to Germany and while there published a treatise on Lusatian fungi. He returned to America in 1812 and settled as pastor in Salem, N. C. By his indefatigable researches he discovered over 1400 new species of American plants, chiefly fungi. He published catalogues of the fungi of North Carolina (1818), and afterwards of North America (1832). His other publications were botanical monographs. From 1821 he resided at Bethlehem, and died there Feb. 8, 1834.

SCLATER, PHILIP LUTLEY, English ornithologist, was born at Hoddington House, Hants, in 1829. He was educated at Corpus Christi College, Oxford, graduating in 1849, and being made fellow of the college. In 1855 he was called to the bar at Lincoln's Inn. In 1859 he was made secretary of the Zoological Society at London. His numerous articles on ornithology and the distribution of animals have been published in the *Transactions* of that Society, in the *Ibis*, and in the *Natural History Review*, both of which he edited. From 1875 to 1877 he was private secretary to his brother, Right Hon. George Sclater-Booth, who was then President of the local government board. Afterwards he was general secretary to the British Association for the Advancement of Science until 1882, when he was made Vice-President of that Association. Among his publications are *Zoological Sketches*, *Catalogue of American Birds*, and *Guide to the Gardens of the Zoological Society of London*.

SCLOPIS, FREDERIGO, COUNT (1798-1878), Italian jurist, was born in Turin, in 1798. He studied law at the university of his native city; took his degree in 1818; and gained distinction by compiling, in 1837, the civil code of the Kingdom of Sardinia, as well as in various departments of jurisprudence. In 1845 he was elected corresponding member, and, in 1869, foreign member of the French Institute. In 1848 he became minister of justice and ecclesiastical affairs, and was president of a commission for framing more liberal press laws. In 1849 he was named Senator, and was president of the Sardinian Senate till 1861, when he became president of the Senate of Italy, which office he held till 1864. In 1868 he was decorated by Victor Emmanuel with the order of the Annunziata, and, in 1872, was appointed by him Italian arbitrator at the Congress of Geneva for the settlement of the Alabama claims (*q. v.*). There he was further honored by being made president of the court, and as a token of its sense of the ability and tact with which he performed the functions of his high office, the American government presented him, in 1874, with a valuable service of silver plate. He was the author of several works, but his principal one is

La Storia della Legislazione Italiana (3 vols., Turin, 1840-57). He died at Turin, March 8, 1878.

SCOTT, THOMAS (1747-1821), English Biblical commentator, was born at Braycroft, Lincolnshire, Feb. 16, 1747. In his early life he was a farm-laborer, yet in spite of poverty obtained a good education and took orders in the Church of England in 1773. Through the influence of Rev. John Newton, Cowper's friend, he became a Calvinist, as related in his *Force of Truth* (1779). He succeeded Newton as curate of Olney in 1781, but a few years later removed to London, where he was chaplain of a hospital. In 1801 he became vicar of Aston Sandford, and here he died April 16, 1821. His chief work is his *Family Bible with Notes* (5 vols., 1788-92), which has passed through many editions both in England and America. His son edited his *Works* (10 vols., 1823).

SCOTT, WILLIAM ANDERSON (1813-1885), Presbyterian minister, was born at Rock Creek, Tenn., Jan. 31, 1813. He graduated at Cumberland College, Kentucky, in 1833, and studied theology at Princeton. Entering the Presbyterian ministry he was missionary in Louisiana, and afterwards principal of academies in Tennessee. In 1840 he became pastor at Tuscaloosa, Ala., and in 1843 took charge of a church at New Orleans. He went to San Francisco in 1854 to be pastor of Calvary Church, and was conspicuous for his opposition to the Vigilance Committee as afterwards for his support of the Secession movement. In 1858 he was moderator of the Presbyterian General Assembly. In 1861 he went to England, becoming for a time pastor of a church in Birmingham. In 1863 he took charge of a church in New York city, and in 1870 returned to San Francisco. There besides being pastor of St. John's Church he was professor in the Theological Seminary and editor of a religious magazine. He died at San Francisco, Jan. 4, 1885. His publications were volumes of sermons, including *Achan in El Dorado* (1855); *Trade and Letters* (1856); *The Giant Judge* (1858); *The Church in the Army* (1862); *The Christ of the Apostles' Creed* (1867).

SCRANTON, a city of Pennsylvania, county seat of Lackawanna co., is on the Lackawanna river at the mouth of Roaring Brook, 18 miles N. E. of Wilkesbarre. It is an important railroad, coal mining and iron-manufacturing town. Locomotives, steam-boilers, railroad and mining machinery, cars, stoves, wagons and carriages, and edge tools, are produced in large numbers. Scranton has 12 banks, an opera-house, theatre, hospital, a cathedral and 40 churches, academies, and public schools, and a public library. Three daily and 12 weekly newspapers are published here. The town was founded in 1840, taking its name from its founders. It became a city in 1856. It is well built with wide streets and handsome edifices. Its population in 1880 was 45,850, making it the third in rank in Pennsylvania.

SCRIVENER, FREDERICK HENRY AMBROSE, English scholar, was born at Bermoudsey, Sept. 20, 1813. He graduated at Trinity College, Cambridge, in 1835, took orders, and was engaged in teaching. While rector of Falmouth from 1846 until 1861 he also conducted a school there. He was afterwards rector of St. Germans, Cornwall, and in 1876 became vicar of Hendon. He was one of the company of revisers of the New Testament from 1870 to 1882. His publications relate chiefly to the Greek *New Testament*; besides valuable editions of this work, they comprise *Plain Introduction to the Criticism of the New Testament* (1861); *Collation of the Codex Sinaiticus* (1863); *Codex Bezae* (1864); *Cambridge Patriograph Bib'le* (1873).

SCUDDER, JOHN (1793-1855), missionary, was born at Freehold, N. J., Sept. 13, 1793. He gradu-

ated at Princeton in 1811 and at the College of Physicians and Surgeons, New York, in 1815. After a few years' practice of medicine he was convinced of his duty to carry the Gospel to the heathen, and was licensed in the Reformed (Dutch) Church in 1819. He sailed for India and was ordained there by missionaries of other denominations. At Jaffnapatam he opened a hospital and a college, which were highly successful. In 1836 he removed to Madras to superintend the printing of the Scriptures in Tamil. In 1842 he returned to the United States and spent three years in pressing on American churches the claims of foreign missions. Returning to his labors in the Arcot mission, he wrought with such zeal that his health was injured. He was ordered by his physicians to the Cape of Good Hope, and died at Wynberg, near that cape, Jan. 13, 1855. His *Life* was written by J. B. Waterbury, D.D. (1870).

His seven sons and two daughters all served as missionaries in India. Of them may be noted HENRY MARTYN SCUDDER, who was born at Panditeripo, Ceylon, Feb. 5, 1822, graduated at the University of the City of New York in 1840, and at Union Theological Seminary in 1843. Sent out by the American Board, he labored at Madras, Arcot, Vellore and other places, organizing schools and churches. He also studied and practised medicine and established a dispensary at Arcot. He prepared several religious works in the Tamil, Telugu and other languages. In 1864 he returned to the United States and became pastor of a Presbyterian Church in San Francisco, and in 1871 removed to Brooklyn, where he was pastor of a Congregational Church until 1882, when he removed to Chicago. After five years' pastorate there he resigned to resume missionary work in Japan.

SCUDDER, SAMUEL HUBBARD, naturalist, was born at Boston, April 13, 1837. He graduated at Williams College in 1857 and at Lawrence Scientific School in 1862. He then served as assistant to Prof. Louis Agassiz in the museum of comparative zoology, and in 1864 was made custodian of the Boston Society of natural history, of which he had already been secretary. He devoted himself chiefly to entomology, and has published reports on the insects of New Hampshire and on those collected in several U. S. Government surveys as well as the Canada geological survey. From 1879 to 1885 he was assistant librarian of Harvard University, and in 1886 he was appointed paleontologist of the U. S. Geological Surveys. Among his publications are *Phasil Butterflies* (1875); *Catalogue of Scientific Serials of all Countries, 1633-1876* (1879); *Butterflies* (1882); *Nomenclator Zoologicus* (1882); *Winnipeg Country* (1886), the last being a sketch of his adventures with a solar eclipse expedition in Manitoba.

His brother, HORACE ELISHA SCUDDER, author, was born Oct. 16, 1838. He graduated at Williams College in 1858 and for a few years engaged in teaching in New York city. His stories for children, *Seven Little People and their Friends* (1862), having proved highly successful, he removed to Boston and devoted himself to literature. He edited the *Riverside Magazine* from 1867 to 1870, the series of "American Commonwealths" and collections of American prose and poetry. Among his most successful books for children are *The Bodley Books* (8 vols. 1875-87); *Dwellers in Five Sisters Court* (1876); *Children's Book* (1881). He contributed *Noah Webster* (1882) to the series of "American Men of Letters," and published a *History of the United States* (1884). Among his other works are a biography of his brother, David Coit Scudder (1864), who had been a missionary in India.

SCULPTURE IN AMERICA. The feeling for form, as evinced in sculpture, is naturally one of the first directions in which the art-in-tinct of a

nation first finds expression. In this country the opposite may almost be said to be the case. America had produced a number of respectable portrait and figure painters, and a few who possessed real genius, before the plastic art became a recognized phase of our art-development.

The art of sculpture can hardly have said to have existed here before the Revolution, if we except the efforts of Deacon Shem Drowne, who executed some quite elaborate weather-vanes, and Patience WRIGHT, whose clever miniature heads in relief, modeled in wax, gained her considerable repute.

One of the first to show the latent capacity of our art in this direction was William RUSH (1756-1833), an artist of undoubtedly great talent. He first became known as a carver of figure-heads for ships, in which line he produced much excellent work. His works are all in wood or clay, which latter material he began to use in 1789. Various ideal figures and portrait busts of Linnæus, William Bartram, Lafayette, and others are among his works, which show much originality and realistic strength. His statue of Washington is in Independence Hall, Philadelphia.

Shortly after Rush had begun work, several foreign sculptors visited America. John Dixey, an Irishman, who came over in 1789, produced several ideal works, among them Hercules and Hydra, Ganymede, etc. Giuseppe Ceracchi, a Corsican, visited Philadelphia in 1791, and executed busts of Washington, Alexander Hamilton, and other prominent Americans. Having returned to Paris, he was detected in a plot against Napoleon, and was guillotined in 1801. Jean Antoine Houdon (1740-1828) came over in 1785 to execute the statue of Washington which now stands in the capitol at Richmond. His cast of the head of Washington has proven extremely useful to many of our native sculptors of a later date. Washington has always been a popular subject with our artists, and just as most of the portrait-painters of his time tried to obtain sittings from him, so nearly every one of our sculptors of portrait-statues has, at some period of his career, produced his statue of the great American.

As late as 1816, Trumbull told Frazee, who applied to him for assistance in studying sculpture, that it would not be wanted here for a century. Yet even there were signs of the awakening of a taste and talent for this branch of art. The before-mentioned John FRAZEE (1790-1850), a stone-cutter, produced a number of portrait busts.—John Wells, said to be the first portrait in marble from a native hand, John Marshall, Daniel Webster, Andrew Jackson, John Jay, and others. With almost no art-education, and but few opportunities for developing his undoubted ability, he yet showed in his works much feeling for the ideal and a power that might have produced greater results under more favorable circumstances. His contemporary, Hezekiah AUGUR (1791-1858), is also one of those artists, frequently met with in the history of this country's art, who began their careers in trades and occupations quite different from the art to which they later devoted their lives. As one critic has observed, his work is less notable for its intrinsic value than as an evidence of what may be accomplished by untrained talent, with no educational advantages.

The first ten or fifteen years of this century witnessed the birth of some of the most noted of our earlier sculptors, among whom Powers and Crawford held a commanding position.

Hiram POWERS (1805-73), born in Vermont, early emigrated with his family to the West, settling in Cincinnati. After following various occupations for a while, he found opportunity first to exercise his talent for modeling in executing wax figures for a

museum. Subsequently a German artist taught him the art of modeling in plaster. Aided by Mr. Nicholas Longworth, who showed so much liberality towards our artists, he soon found ample employment in modeling the features of many prominent public individuals, notably Andrew Jackson, Webster, Calhoun, Chief-Justice Marshall and Edward Everett. In 1837 he went to Italy, where he remained until his death. During his long career he executed a number of well-finished and meritorious ideal works, in which he showed much sentiment and considerable technical skill. His statue of the Greek Slave, of which a duplicate was exhibited in the United States, aroused much enthusiasm. Many have praised it for its pure and noble sentiment, and as representing a high type of beauty. Of the adverse criticism that by Jarves in his *Art Idea* is especially severe. Six copies in marble were made of the Greek Slave as well as innumerable reduced copies in parian, casts, etc. The Eve before the Fall and Eve after the Fall are considered by some his best ideal statues, and *Il Penseroso*, Fisher Boy, Proserpine and California are also among his more important works. Though perhaps best known to the general public by these ideal works, notably the Greek Slave, he seems, however, to have achieved his greatest success in portraiture, and his portrait busts are excellent in the portrayal of character and in execution. His mechanical talent enabled him to invent various appliances for facilitating the labors of the sculptor's art.

Thomas CRAWFORD (1814-57) was a man cast in a large mould. There is something grand and earnest in all of his works, and his versatility, enthusiasm and untiring industry were quite remarkable. His first studies were made under Frazee and Launitz, and in 1834 he went to Italy, where he entered the studio of Thorwaldsen. Of his works best known to the public, the majestic and spirited equestrian statue of Washington, at Richmond, and the statue of Beethoven are the most important. Both were cast in Munich, where they attracted much attention. The works ordered by the United States government are also important. They include the panels for the bronze door of the Capitol at Washington, illustrating the American Revolution, the fine statue of Liberty surmounting the dome of the Capitol, and a marble pediment, with symbolical figures delineating the progress of American civilization. The Orpheus and Cerberus, his first ideal group, executed in 1839, is considered by some the work in which his power and ability are best shown. Another well-known statue by him, the Indian Chief, won the admiration especially of the sculptor Gibson.

Another sculptor of this period who must be reckoned among the first of our artists, is Horatio GREENOUGH (1805-52). He was a man of fine intellectual attainments and had, in fact, like several of our prominent artists of the time, a decided literary vein in his composition. His Chanting Cherubs, ordered by J. Fenimore Cooper, was, according to Tuckerman, the first group in marble executed by an American. He is best known by the Bunker Hill Monument, which he designed, and the statue of Washington at the National Capitol. The latter has been the subject of much criticism and ridicule. Its nudity has been objected to as incongruous, and in condemning him for imitating the antique, comparisons have been drawn between this work and Benjamin West's Death of General Wolfe. Yet the statue is withal a noble piece of work. Besides, it must be remembered that Greenough intended it to be placed indoors, in which case the half nude figure would have seemed less incongruous, and gained considerably in impressiveness.

Joel T. HART (1810-77) was a Kentuckian who

first earned a livelihood by chimney-building and later in a stone-cutter's yard. He began to model in clay, and his likenesses soon attracted attention; thereafter, his services were frequently in requisition. Among his portrait busts are those of Jackson, Taylor, and Governor Crittenden, all characteristic and truthful likenesses. It has been said that in some of them the look of flesh is remarkable. His statue of Clay is in Louisville, Ky. In ideal works, like Angelina and the graceful Woman Triumphant, he shows a delicate, refined fancy.

Another, who, like not a few of our earlier sculptors, began his career as a stone-cutter, was Shobal Vail CLEVENGER (1812-43). The success which he had in some of his artistic efforts encouraged him to attempt portraiture. He soon left Cincinnati, where he was working, for the East, and found ample employment in modeling busts of numerous prominent men, among them Clay, Everett, Webster, Allston, Van Buren. In these he gave us a valuable series of remarkably truthful and realistic portraits.

Henry K. BROWN (1814-86) was at first determined to become a portrait-painter, but his attention having been drawn to sculpture he adopted that as a profession. To the general public he will always be known as the sculptor of the equestrian statues of General Scott, at the National Capitol, and Washington in New York. The latter, though open to criticism, is, on the whole, good technically, the horse spirited and graceful, and the general effect grand and noble. It is, moreover, the first statue in bronze wholly made in America.

Some writers have, perhaps with justice, pointed to the works of Clark MILLS (1815-83), as the result, in a measure, of the complete ignorance in art-matters so frequently displayed by the people. His statue of Gen. Jackson, in Washington, is notable especially for the dexterity with which the sculptor has succeeded in so balancing the prancing charger that it needs no support but its own weight. His ability is unquestioned, but he shows in his works rather dexterity and skill, than true genius or a higher art-feeling.

In Benjamin Paul AKERS (1825-61) we find one of the most gifted of our sculptors. His art-instinct was awakened at an early age, and he attempted painting. But this failed to satisfy him, and it was the sight of a plaster cast that first revealed to him his true vocation. He unfortunately died too young for a complete unfolding of his talents or the production of works that would have been rather fitted to perpetuate his memory than simply to give promise of greater success to come. But in his last statues, like that of the Pearl Diver, an exquisitely beautiful creation, his strong imaginative faculty, his tender, sympathetic, and strongly æsthetic nature as well as his thorough knowledge of the principles of art, are revealed to us. We find in him, again, that taste for literary pursuits, referred to previously as not uncommon among our earlier artists.

A sculptor of rare natural talent was Edward S. BARTHOLOMEW (1822-58). His early life, owing to his uncouraged love for art, was a struggle with adversity. Like Akers he tried his hand first at painting, but having discovered that he was totally color-blind, he turned his attention to sculpture. He produced a number of classic and scriptural subjects, in which he showed much fancy and inventive power. It has been said of him (Tuckerman quotes the remark), that his most prevalent talent was "an intuitive perception of the strongest and most statuesque aspect of a theme." A large number of his works are in the Wadsworth Gallery, Hartford, Conn.

Thomas BALL (b 1819) also turned his attention first to painting, attaining some pro-

iciency in portraiture. About 1852 he took up modeling. He has produced a number of portrait busts and several statues. That of Webster, in New York, and the equestrian statue of Washington, in Boston, are perhaps his noblest works. Other sculptors there are of this period, whom limited space prevents us from giving more than passing notice. Among these are Henry Dexter (1806-76), specially successful in his portrait busts; Richard S. Greenough (b. 1819), a brother of Horatio, and whose best-known work is the statue of Franklin, in Boston, and Ball Hughes (1806-68), Leo-

nard W. Volk (b. 1828), best known, perhaps, by his monument to Stephen A. Douglas, in Chicago; Charles Calverley (b. 1833); Moses Jacob Ezekiel (b. 1844), who made the group of Religious Liberty, in Fairmount Park, Philadelphia, and has won many honors abroad; C. B. Ives; Barbee; J. W. A. Macdonald (b. 1824); James H. Hazeltine (b. 1833), and Edward V. Valentine (b. 1828), who has executed many statues of Confederate heroes. Valentine's Lee Recumbent is in the Mausoleum of Washington and Lee University, Lexington, Va.

VALENTINE'S "LEE RECUMBENT."

William Wetmore STORY (b. 1819) possesses to a high degree that delicate and noble sentiment, without very great power, which characterizes the works of not a few of our sculptors. His versatility is quite remarkable. Originally a practising lawyer, he published several legal works. Poetry next claimed his attention, and he finally went to Italy to devote himself to sculpture, still, however, occasionally exercising his pen. He holds a prominent position in art, although he has at times been rather indiscriminately praised. His sculpture is not strikingly original, but it is carefully finished, well thought out, severe and classic, and inspired by noble and elevating sentiments. In works like Jerusalem Lamenting, Cleopatra, and the Sibyl, his talents are conspicuously shown.

One of the most truly idealistic sculptors we have had is William H. RINEHART (1825-74). Working at first in a stone-quarry, his evident talent soon attracted attention, and in 1855 he went to Italy to continue his studies. Latona and her Infants, the Sleeping Babes, a Nymph, and Clytie, which he himself pronounced his masterpiece, are among his works. He also completed the bronze doors of the Capitol at Washington, left unfinished by Crawford at his death. Another unfinished work by Crawford, the Washington monument, at Richmond, was completed by Randolph ROGERS (b. 1825). Besides Ruth and various ideal figures Rogers has executed statues of Lincoln for Philadelphia and Seward for New York, and is favorably known by the eight panels for the bronze doors of the Capitol at Washington, delineating scenes in the life of Columbus. Larkin G. MEAD (b. 1835) first gave evidence

of his talents by modeling a figure of an angel in snow. He speedily won recognition, and has executed several public monuments, among them

RANDOLPH ROGERS' "RUTH."

a statue of Lincoln for the monument in Springfield, Ill. Martin MILMORE (1844-83), like Volk, executed several very creditable monuments erected to the soldiers and sailors of the Civil War, notably that in Boston. The subjects of monuments of this class have probably much to do with the fact that they are seldom works of art of a very high order. Franklin SIMMONS (b. 1842) has shown talent and

true art-feeling in statues like those of Roger Williams and Longfellow. The Ghost in Hamlet, the West Wind, and similar works, by Thomas R. GOULD (1818-81), show fancy and ideal feeling rather than technical knowledge.

Originally a carpenter, Erastus D. PALMER (b. 1817) did not turn his attention to art until his 29th year. Beginning as a cutter of cameo portraits, he soon sought a broader field for his talents, and in 1850 exhibited his first piece of sculpture, the Infant Ceres. Like Rinehart, he was a true idealist, with a clear perception of the beautiful. There is, moreover, a vein of domestic sentiment, and a depth of religious feeling shown in many of his productions. His more notable works include The Indian Captive, representing the dawn of Christianity on the savage mind; the purely beautiful White Slave; Spring; The Angel of the Sepulchre, and the exquisite bas-reliefs Morning and Evening. It is a fact worthy of note that, unlike most of our sculptors, he did not acquire his knowledge of art and its technique abroad, but in his native land.

Some of the finest of the statues that adorn our public places are the work of J. Q. A. WARD (b. 1830), one of the most vigorous and original of our sculptors. His work is thoroughly national in subject and spirit, for he has never been unduly influenced by foreign models. Of his portrait statues the most successful are those of Gen. Thomas (one of the best of our equestrian statues), and Washington (at Newburyport). The latter, a noble and majestic work, is a notable addition to the very limited number of really commendable statues of Washington which we possess. Several of Ward's best works are in New York, among them the noble statue of Shakespeare, and the Indian Hunter, one

WARD'S "INDIAN HUNTER."

of his earlier productions, which, though its entire anatomical correctness has been questioned, is yet a characteristic and spirited piece of work, and one of the most notable examples of American plastic art.

Another sculptor whose work ranks with the best produced in this country is LAUNT THOMPSON (b. 1833), a pupil of Palmer. He early developed an extraordinary talent for medallion portraits, and became one of the strongest and most successful of our portrait sculptors. In works like the bust of Edwin Booth, the statue of Gen. Sedgwick, that of Napoleon, the well-known and excellent one of President Pierson, at Yale, and the equestrian statue of Gen. Burnside, he has shown a talent for

portraiture equalled by few of our sculptors. Dr. William RIMMER (1816-79), whose life was devoted mainly to teaching, exerted a decided influence on the art of our younger sculptors. He was a most profound student of art anatomy, on which subject he published a valuable work. He modeled several energetic works, of which the Gladiator, especially, is remarkable for the thorough knowledge of the human figure which it betrays.

In John ROGERS (b. 1829) we find an artist whose work is quite unconventional. He has chosen most of his subjects from the every-day life around him, and in delineating its humorous and pathetic aspects he is quite unrivalled. In illustrating incidents of military life—the life of the common soldier—he first struck a sympathetic chord. There may be no "high art" in his groups, but they appeal to popular feeling and have undoubtedly had a considerable share in elevating the artistic tastes of the people.

The number of women who have turned their attention to sculpture has always been limited, but there are a few American ladies who have gained a certain reputation in this branch of art. The most prominent, Harriet HOSMER (b. 1830), went to Italy in 1852 to study under Gibson. Although her works are perhaps not all satisfactory from an artistic point of view, yet in statues like Puck, the Sleeping Faun, and the colossal and majestic Zenobia, she has been very successful, and all her works bear the stamp of a strong and decided individuality. Emma STEBELS (1815-82), the friend and biographer of Charlotte Cushman, produced, among other works, a statue of Horace Mann for Boston, and a large fountain for Central Park, New York. Miss Anne WHITNEY also gained distinction as an earnest and thoughtful artist. Others who have gained repute in this branch of art are Mrs. H. A. L. Freeman, wife of the artist James E. Freeman, Winnie Ream Hoxie and Edmonia Lewis.

In reviewing the work thus far accomplished in American sculpture, we find that, as in painting, there has been much that is merely imitative. We have seen much "classic" work, which, though often inspired by pure and noble sentiments, and at times executed with considerable technical ability, yet naturally lacked the spirit which pervades the sculpture of antiquity. As in painting, so here some of the best efforts of the earlier artists were exerted in portraiture.

The ignorance in art-matters frequently shown by those who made it their business to select artists for the many national monuments that have already been executed here, has resulted in producing not a few monstrosities that should never have been erected to disfigure our public places. Still, our few really able sculptors have produced some works of lasting merit.

To continue the comparison with painting, the new, progressive movement that has taken place there is also strongly felt here. There have arisen a number of younger sculptors all more or less in sympathy with the strongly realistic tendencies of this new movement. Though much of their work is yet immature and not wholly satisfactory, yet some of them have already attained lasting fame. One of the most prominent is Augustus St. GAUDENS, who received his technical training under Joffroy in Paris. He has executed a very beautiful bas-relief, the Adoration of the Cross by Angels, in St. Thomas' Church, N. Y., and in his statues of Pres. Lincoln (see p. 459), Admiral Farragut and Robert R. Randall, and the bust of Gen. Wm. T. Sherman, we have excellent examples of powerful, realistic and unconventional style in portrait sculpture. Wm. R. O'DONOVAN has also been very successful in his portrait busts, among which is the masterly one of William Page. The monument to the captors of

André, at Tarrytown, and the statue of Washington, for the Newburg monument, are also his works. Frank DENGLEB; Daniel C. FRENCH,

ST. GAUDENS' "ABRAHAM LINCOLN."

sculptor of the Minute Man, at Concord, and the statues of John Harvard and Lewis Cass; Howard ROBERTS, known best by the exceedingly bold and striking statues of Lot's Wife and Hypatia; J. S. HARTLEY, at one time professor at the Art Students' League, and Olin L. WARNER, are among the other important representatives of the new school.

The work of these young men, though, as said before, not by any means entirely faultless, gives promise of a bright future for the plastic art in this country. (F. L. W.)

SEABURY, SAMUEL (1729-1796), first bishop of the Episcopal Church in America, was born at Groton, Conn., Nov. 30, 1729. He graduated at Yale in 1748, and studied theology under his father, then rector at Hempstead, L. I. After taking a year's medical course at the University of Edinburgh, he was ordained deacon by the Bishop of Lincoln Dec. 21, 1753, and priest two days after by the Bishop of Carlisle in London. Returning home, he did missionary work at New Brunswick, N. J., 1754-56, was rector at Jamaica, L. I., 1757-67, and then at Westchester, N. Y. As was the case with most of the Episcopal clergy at that time his sympathies were with the royalists: he became obnoxious to the Whigs through his "Farmer's Letters" reflecting on the Continental Congress, Nov. and Dec. 1774. Withdrawing to New York city, he practised medicine for a time and acted as chaplain of the King's American regiment, 1778. Oxford gave him the degree of D.D., 15 Dec. 1777. The Episcopal ministers of Connecticut, in session at Woodbury on March 25, 1783, elected him bishop; but grave difficulties stood in the way of his consecration. The English bishops feared to act without the consent of Parliament, which could not be procured in the case of a foreigner who could not take the oath of allegiance prescribed by law. After long delay he applied to the Scottish bishops, who were not state officials, and was privately consecrated by three of them at Aberdeen, Nov. 14, 1784, thus procuring the succession for America. Drs. White, Provost and Madison having afterward been consecrated in England, he joined them in consecrating Dr. Claggett, who thus represented both the Anglican and

Scottish lines, and in organizing the American Episcopal Church in the General Convention of 1789. Seabury was an active and efficient prelate, much respected for his character and talents. Two volumes of his sermons were published 1791 (again 1793 and 1815), and a third volume 1798. He died at his home in New London Feb. 25, 1796. Rev. E. E. Beardsley, D.D., published his *Life and Correspondence* (1881).

SEALSFIELD, CHARLES, was the assumed name of KARL POSTEL (1793-1864), whose true history was not revealed till after his death. He was born at Poppitz, Moravia, March 3, 1793, and after being educated at Znaim, entered the convent of the Knights of the Cross, and was ordained a priest. His unruly spirit and lively imagination brought him into trouble, and in 1822 he escaped from the convent and found refuge in Switzerland. Under his assumed name, he soon emigrated to the United States and was employed on newspapers in New York city. In 1826 he visited Germany and England, publishing in the former a description of America and in the latter *Austria as it is* (1828), which was translated into several languages. In 1827 he returned to the United States and after extensive journeys in the Southwest and Mexico, bought a plantation in Louisiana. But the failure of his banker ruined his prospects and he returned to the North. He then published at Philadelphia a novel, *Tokeah, or the White Rose* (1828), which he afterwards enlarged in a German edition, *Der Legitime und der Republicaner* (3 vols., 1833). Meantime he had been employed in journalism at London and Paris and settled in Switzerland, where he is said to have had intimate relations with Queen Hortense. His American experiences furnished him with material for many books, which were mostly written in German, but soon translated into French and English. Among these were *Transatlantic Travelling Sketches* (1834); *The Cabin Book, or Sketches of Life in Texas* (1835); *The Viceroy and the Aristocrats, or Mexico in 1812* (2 vols. 1835), which is his best work; *Pictures of Life in both Hemispheres* (2 vols. 1837); *North and South* (1848); and *Morton, or the Grand Tour* (1846). A collection of his works in German comprising 18 volumes was published at Stuttgart in 1846. He visited America again in 1850 and 1859. His plantation in Louisiana had then become very valuable, but the war interrupted his returns from it. His last years were spent in Soleure, Switzerland, where he lived like a peasant, yet remained a mystery to his peasant neighbors until his death March 26, 1864. After his history was revealed by a clergyman of Zurich, a monument was erected to his memory in Poppitz in 1875. His story has been told by Kertbény in *Erinnerungen an Sealsfield* (1864).

SEARCH, RIGHT OF. The controversy as to the right of maritime visitation and search between the United States and Great Britain was the natural outcome of the change of relationship that they underwent as a consequence of the war of the Revolution. Long after the colonies had asserted their independence of that power Great Britain claimed that their citizens were her subjects and liable to such demands as she might make upon their property or personal services. The treaty of peace of 1783 changed this relation, but left Great Britain disinclined to yield to the Americans anything that could possibly be claimed in virtue of international rights. On the other hand it was to be expected that the United States would take that view of international obligation that would give the largest freedom from intrusions upon her commerce by the powerful navy of her rival, who had been foiled in the effort to make a monopoly of the commerce of America.

See Vol. XXI, p. 608 (p. 638 Am. Rep.).

The maritime police of the high seas was internationally recognized as in the navies of the respective powers, but the power that maintained the largest naval force necessarily had a preponderating influence in that important administration, and naturally was inclined to enhance the measure of authority due to that function. The terms upon which the cruisers of the various nations could inquire into the national character of vessels upon the seas, so as to suppress piracy, were not in dispute. It was conceded that during war the cruisers of the belligerents could visit and search the vessels of neutral powers for the property of any enemy or for contraband of war, and for the purpose of rendering blockades effectual, provided this power was exercised in a reasonable manner and no demand was made except of passive submission to the exercise of such right, but the existence of such a right in time of peace was strenuously denied by the powers at large and reluctantly yielded by Great Britain.

In the relations between the United States and Great Britain an exceptional use of the power of visitation and search was claimed as a right in one case and insisted upon as a concession in another. Great Britain claimed the right to search American ships for the purpose of taking from them the subjects either claimed as deserters from her marine or needed for that service, and with a view to impressment for that purpose. At a later time Great Britain pressed the recognition of a right of search, encroaching upon the principles of international law, for the purpose of suppressing the African slave trade.

As it regarded the right claimed over American vessels with a view to furnish the British navy with seamen, the United States stoutly resisted the claims of Great Britain as not covered by international recognition and as an encroachment upon the sovereignty of the United States, that was not to be tolerated, and was particularly liable to abuse in view of the close relations between the people of the two countries and their habits of national and local interchange. The United States claimed that the right of visitation and search was merely a belligerent right that could exist only as an incident of war; they also claimed that even as a belligerent right it could not be exercised against a neutral vessel as an assertion of proprietorship over her cargo in behalf of a belligerent or her subjects, as that would be the exercise of a sovereign function under the flag of another sovereign. Much less could that belligerent right be made to cover the exercise of authority over persons under the protection of the sovereign under whose flag they were.

Great Britain relied upon the strength of her navy rather than upon the established usages of nations, and persisted in a course that ultimately brought on war between the two countries. During the Napoleonic wars in 1807 it was charged that British seamen, deserters from her naval service, were harbored at Norfolk, Va. Some British vessels of war were in that vicinity. The American frigate *Chesapeake* was at this port fitting for sea. She at length sailed, but the British man-of-war *Leopard* preceded her and arrested her progress, demanding the right to search her for British deserters. This demand being refused, the British ship opened fire upon the *Chesapeake* and the latter, not being prepared for such unexpected an attack, hauled down her colors. Search was made and several persons were taken from the *Chesapeake* as deserters and carried away by the *Leopard*, which now asserted against the *Chesapeake* none of the rights of the capture.

Congress and the country at large were incensed at this flagrant violation of sovereign right. Congress placed an embargo on trade with Great Britain

as a consequence of this act. A British commissioner sent to this country in the latter part of the same year to treat in regard to the affair of the *Chesapeake*, was disposed to negotiate as it regarded the question of the right to make search in national vessels for deserters. The United States were unwilling to discuss that question apart from the general question of the right to search merchant vessels, and nothing came of the attempt to negotiate. The Embargo law was repealed upon the accession of Mr. Madison to the Presidency, and a non-intercourse law substituted in its place. Aggressions having in the meantime been made by France on American commerce both England and France were included in this non-intercourse act, their armed vessels being excluded from the ports of the United States, until the violations of neutral rights by those nations should cease. The exclusion of armed vessels was soon revoked as against France upon assurances that the objectionable Milan decree would be revoked, but was continued against Great Britain. British ships were stationed upon the American coast that searched all American vessels and made captures.

In 1811 Congress made military preparations in view of the anticipated hostilities with Great Britain and declared war against her. The hostilities that ensued exhibited, in June, 1812, both in their character and duration, the absence from the policy of Great Britain that led to them of any principle worthy of being vindicated by war. (See WAR OF 1812.) The war was terminated in 1814 by the treaty of Ghent. The remarkable feature of this treaty is that it did not adjust in terms the matter of difference between the two countries, although in effect it produced that result. Since that time Great Britain has made no assertion against the United States of any right to search American vessels for deserters from her navy.

The international efforts to suppress the African slave trade reopened the subject of visitation and search in its application to the detection of slave ships, but the differences that existed between the two countries as to the limit of that right were confined within the limits of negotiation. Great Britain urged the necessity of treaty provisions that would open to search by the national vessels of each country the merchant vessels of the respective countries. The United States, while sympathizing with the object of the effort to suppress the slave trade, were unwilling to create a precedent that might lead to complications tending to impair their maritime interests.

After a prolonged effort to arrive at some mode of exercising maritime police for the purpose of suppressing the African slave trade a treaty was concluded with Great Britain in 1862, by which a limited and regulated right was conferred by each nation upon the armed vessels of the other to examine its merchant vessels when reasonable ground existed for a suspicion that they were engaged in, or fitted for the slave trade. This right was only to be exercised by vessels of war duly authorized for that particular service and carrying instructions that formed part of the treaty, and was to be exercised against merchant vessels only. The right of visitation was to be exercised only within 200 miles of the coast of Africa, south of 32° N. lat., and within 30 leagues of Cuba. It was required that when a vessel should be visited, the instructions carried by the visiting ship should be exhibited, and a certificate of the fact and ground of search given to the commander of the vessel visited, stating the vessel making the search, and the name and rank of its commander.

Mixed courts were established in the United States and at points within the jurisdiction of Great Britain, on the African coast, in which both

nations participated for the trial of cases arising under the treaty, and the vessels of each country subjected to detention were to be sent to the tribunal of the country to which they belonged for trial. The features of the outfit of a vessel that should be regarded as indicating an intention that she should be employed in the slave trade were carefully detailed in the treaty. Provision was made for awarding damages where the detention was not justified by the treaty, and also for the liberation of negroes found in condemned vessels.

In the next year, 1863, this right of search was territorially extended. In 1870, by treaty, the mixed courts were abolished, and the proper courts of the respective nations substituted therefor, American vessels to be sent to American courts and British vessels to British courts.

The right of search thus organized between the United States and Great Britain as it regarded the slave trade was assimilated to that which exists under international recognition in the case of piracy, but subject to specific regulations that have been described. This treatment of the subject is expressive of a close relation between the two classes of cases as depending upon the same principles.

The honorable career thus begun by the United States, in the interest of the liberties of commerce, has in later years developed an effort to place a more clear and just interpretation upon neutral rights in which effort she has happily been brought into relations to Great Britain more becoming nations advanced in civilization than those which were the subject of past differences between them.

(A. J. W.)

SEARS, BARNAS (1802-1880), educator, was the son of Paul and Rachel (Granger) Sears, and was born at Sandisfield, Mass., Nov. 19, 1802. His earlier education was received in his native town, and his immediate preparation for college at the University Grammar School in Providence, R. I. He graduated at Brown University in 1825, and then became a student in the Theological Institution at Newton Centre, Mass. In 1827 he was ordained pastor of the first Baptist Church of Hartford, Conn. This pastorate lasted only two years, as in 1829 he was chosen a professor in the Literary and Theological Institution at Hamilton, N. Y., now known as Madison University. This professorship he held for four years, resigning and going to Germany in 1833, where he remained nearly three years engaged in the earnest prosecution of various studies, chiefly historical, philosophical and theological, at several noted German Universities. In 1836, on his return from Germany, he was elected professor of ecclesiastical history in the Newton Theological Institution, and in 1839 he was made professor of Christian Theology and president of the Institution. When he became professor at Newton the number of men in the colleges and theological schools who could make intelligent and effective use of German learning and criticism was by no means large. Becoming editor of the *Christian Review* in 1838, his free use of what his long stay in Germany had made available, speedily gave to that Quarterly its distinctive characteristics among the Quarterlies of the country. Abandoning this editorship in 1841, he afterwards, when the *Bibliotheca Sacra* was started, continued for many years to use his knowledge of German as a contributor to its pages. In 1848, after twelve years of distinguished service, he resigned his position at the Newton Theological Institution to become the successor of Horace Mann as secretary of the Massachusetts Board of Education. Mr. Mann had accomplished a great work in creating popular interest in public instruction in Massachusetts; that work Dr. Sears carried forward with great energy, and in the seven years which he devoted

to it secured to the State a very complete system of public schools. For this service he was specially fitted by the intimate acquaintance he had acquired while in Germany with the Prussian system of public instruction. In 1855, on the resignation of Dr. Francis Wayland as president of Brown University, Dr. Sears was chosen to succeed him. This office he held with distinguished ability for twelve years. During his presidency, which covered the troublous period of our civil war, some marked improvements in the finances and appliances of the college, as well as changes in the courses of study, took place. Dr. Wayland had introduced in 1850 the "new system," as it was called, which opened a much wider range of studies in science, and specially in applied science, than had before been offered, and which, withal, introduced the new degree of Bachelor of Philosophy, and made the degrees of A. B. and A. M. obtainable in a shorter time than had previously been possible. This system was gradually modified until 1862, when with the exception of a three years' course for the degree of Bachelor of Philosophy, the old curriculum of four years, with a few electives, as a condition for receiving the degree of A. B., was restored. The first centennial of the University occurring in 1865, the occasion was celebrated with a discourse by Dr. Sears on the history of the University and the work it had accomplished.

When in March, 1867, the trustees to whom Mr. George Peabody had committed the care of the great fund given by him for the education of the children of the Southern and Southwestern States which had suffered from our civil war were about to organize a plan for the distribution of the income of this fund, the Hon. Robert C. Winthrop, with whom rested the chief responsibility of devising a plan, chanced to meet Dr. Sears in Boston, and asked him to favor the committee with his views of what their best plan would be. He complied with this request, furnishing the written statement of a plan which made so favorable an impression on the minds of the trustees that they adopted it, and immediately and unanimously elected him as the general agent by whom the plan should be carried into execution. To accept this agency he resigned the presidency of Brown University and entered on its duties in the fall of 1867. And of all the positions which he occupied that of general agent of the Peabody Educational Fund was the one for which nature, training, experience and tastes seem to have preëminently fitted him. He held it longer than any other, and had life and health been spared would have continued to hold it. He died at Saratoga Springs, July 6, 1880. His decease was deeply deplored by the trustees of the fund, and called forth a warm eulogium from the Hon. Robert C. Winthrop on his character and services. His success in the discharge of the difficult duties of the agency had been complete. Entering on those duties at a time when the Southern mind was naturally very sensitive towards everything and every person coming from the North, he yet won for himself and his work the confidence and support of all kinds of people.

Dr. Sears received the honorary degrees of Doctor of Divinity from Harvard College in 1841; and of Doctor of Laws from Yale College in 1862. In addition to many contributions to Quarterlies, published addresses and educational reports, he was also author (with Edwards and Felton) of *Classical Studies* (1843); *The Ciceronian*, which set forth the Prussian method of teaching Latin (1844); *The Life of Martin Luther* (1850). He also edited Nöthen's German Grammar, with additions (1842); *Select Treatises of Luther*, in German with notes (1846), and Rogel's *Thesaurus of English Words and Phrases* (1854).

(E. G. R.)

SEATON, WILLIAM WINSTON (1785-1866), journalist, was born in King William co., Va., Jan. 11, 1785. He was of Scotch descent, and his mother was a cousin of Patrick Henry. He was educated at Richmond, where he became a printer and at an early age engaged in political journalism. He was connected with a newspaper at Petersburg, and owned one at Halifax, N. C. Joseph Gales edited the *Register* at Raleigh, and Seaton joined him in the work, and afterwards married his daughter. In 1812 in company with his brother-in-law he moved to Washington, where they founded the *National Intelligencer*, a journal long conspicuous for its ability, fairness and courtesy. The publishers also compiled a *Register of Debates* extending from 1824, to 1837, and *Annals of Congress* from March 3, 1798 to May 27, 1824. These valuable works are of the highest authority in American history. Gales died in 1860 and Seaton survived him until June 16, 1866. He was honorably connected with the growth of the city of Washington, and was its mayor for twelve years, 1840-51.

SECESSION. The effort of several of the slaveholding States of the Union to separate themselves from those that adhered to the Constitution of the United States is the event to which the term secession has been applied. In 1860 South Carolina assumed to dissolve her connection with the United States and was followed by several of the slaveholding States who together formed a government styled the Confederate States of America. This movement was the natural outcome of the acceptance of the doctrine of States' Rights, that had grown up subsequently to the adoption of the Constitution of the United States, under the influence of local causes peculiar to the condition of the Southern States of the Union. The nature and development of this school of opinion are given under STATES' RIGHTS.

In South Carolina this doctrine had received an interpretation that assumed for it a philosophical basis, that had been supplied by the abstract studies of her great thinker, John C. Calhoun. Conscious that the massing of political powers rendered possible great abuses of such power, detrimental to individual liberty, and fearing the consequences of such abuses, Calhoun overlooked the law of social growth that demanded the existence of highly integrated powers, even though such condition led in the possibility of many evils, and claimed to have found the line of safety in reducing the strength of federated governments to a point that would disable them from committing great wrongs, although the process was one that equally deprived them of the capacity of accomplishing any thing notably good. His idea was that the States of this Union should be united in a way that would make their combined action depend upon diplomatic intercourse between them. Deprived of the power of acting independently of the consent of all the States, hasty and oppressive action would be avoided. In a community of States thus loosely united every step in public affairs would be the product of a compromise painfully worked out of discordant elements. The aspect presented by the States of such a Union would be that of a chain-gang, hobbled and crippled, incapable of intelligent action, and needing a task-master to direct its steps.

While South Carolina was the nidus of disunion she did not assume the leadership of the movement depending on that principle until her institutions and interests were touched by conflicting national interests. The first occasion that brought into activity the consequences of the theory of States Rights was furnished through sympathy with political aspirations deriving their inspiration from the principle of the equality of man in civil society. The French Revolution found a response in Ken-

tucky and Virginia that produced the celebrated Resolutions of 1798, but awakened no heroic sentiment in South Carolina. The reason of this is obvious. The government of South Carolina permitted the least degree of popular intervention in public affairs that was reconcilable with the existence there of popular government. Until the close of the rebellion the only officers in the State chosen at popular elections were the members of the Legislature and of Congress, the sheriffs, and delegates to conventions. The majority of the people of that State were a caste, admitted to no political privileges and under a civil regime that separated them as to their rights and obligations from the residue of her people. Under such circumstances active sympathy with advanced political ideas was not to be expected. The phase of States' Rights agitation induced by opposition to the Alien and Sedition laws was characterized by the presence of a democratic tendency hostile to caste and political monopoly.

The second great upheaval from that same source was in the interest of industries intimately interwoven with slavery. This was the occasion of the attempted nullification by South Carolina of the tariff laws of the United States, and is treated under NULLIFICATION (q. v.).

The third and final effort commenced under the leadership of South Carolina, and distinctly propounded the perpetuation of slavery as its object. Thus from fellowship with the most advanced conception of the equal rights of mankind under government, the States' Rights dogma passed into sympathy with, and support of the aristocratic regime of caste, the institutional denial of all that is implied by the term democracy, and the source of oligarchic tendencies. Both nullification and secession united in the support and perpetuation of slavery, the former dealing with slavery through industries of which slavery was regarded as a necessity, and the latter propounding distinctly the perpetuation of that institution as its end. For the steps that were taken by the seceding States in attempting disunion and establishing a confederate government, see CONFEDERATE STATES AND RECONSTRUCTION. (A. J. W.)

SEDALIA, a city of Missouri, county-seat of Pettis co., is at the intersection of the Missouri Pacific and the Missouri, Kansas and Texas Railroad, 189 miles W. of St. Louis. It contains a court-house, 2 opera-houses, 2 national banks, a savings bank, 10 churches, a high school with fine building, a public library, 3 daily and 4 weekly newspapers. Its industrial works comprise car-works, machine-shops, woolen mills, manufactories of agricultural implements, wagons, machinery, soap and furniture. It was founded in 1860, and in 1880 had a population of 9561.

SEDGWICK, CATHARINE MARIA (1789-1867), novelist, was the daughter of Judge Theodore Sedgwick, and was born at Stockbridge, Mass., Dec. 28, 1789. After her father's death, in 1813, she took the management of a school for young ladies, which she conducted for fifty years. In 1822 she published *A New England Tale*, which had grown under her hand while she was preparing a religious tract. Its success led to a second venture, *Redwood* (1824), which attained even greater popularity. Then followed a long series of tales, letters, historical sketches, and a biography of Lucretia M. Davidson (1841). *Hope Leslie* (1827), *Clarence* (1830), and the *Lincolns* (1835), take rank as her best. Her last book was *Letters to My Pupils* (1862). She died at Roxbury, Mass., July 31, 1867. The *Memoir* was published by M. E. Dewey (1871).

SEDGWICK, JOHN (1813-1864), general, was born in Cornwall, Conn., Sept. 13, 1813, and

graduated at West Point in 1837, in a class comprising Gens. Hooker, Bragg and Early. He was appointed 2d lieutenant of artillery, and served against the Seminoles in Florida and subsequently on the frontier during the Canada border troubles. Having been made 1st lieutenant in 1839, he took part in the Mexican war, at the siege of Vera Cruz, the battles of Cerro Gordo, Churubusco, Molino del Rey, and Chapultepec, and in the assault on and capture of the City of Mexico. He was brevetted successively captain and major for gallantry and meritorious conduct. In 1849 he was promoted to captain, and, in 1855, to major of the 1st cavalry, with which he served in Kansas, being subsequently transferred to the 2d cavalry, of which he was lieutenant-colonel at the outbreak of the civil war. In April, 1861, he was appointed colonel of the 4th cavalry, and in August was commissioned a brigadier-general of volunteers and assigned for service in the army of the Potomac. In McClellan's Peninsular campaign of 1862, he commanded a division of Sumner's corps, and took part in the siege of Yorktown and in the pursuit of Johnston. He especially distinguished himself at the battle of Fair Oaks, arriving, after a toilsome march, just in time to decide the day. He took part in all the engagements of the Seven Days' fight, and again won honor at Savage's Station and Glendale. At Antietam he bore a conspicuous part, leading a division and exposing himself fearlessly. Though severely wounded, for two hours he would not allow himself to be taken from the field. Returning to duty in December he was promoted major-general of volunteers, and, in Feb. 1863, put in command of the Sixth corps. At the head of this corps, on May 3, he stormed the heights of Fredericksburg, but with the heavy loss of 5000 men. Continuing his march to effect a junction with the main army, under Hooker, at Chancellorsville, he was checked in the afternoon at Salem Heights by the troops that Lee was able to detach after repulsing Hooker, and on the next morning when Lee further reinforced these it was only by determined fighting Sedgwick could hold his ground. When darkness fell he withdrew across the Rappahannock. (See CHANCELLORSVILLE.) In the subsequent return into Maryland Sedgwick commanded the left wing of the Army of the Potomac, as he did at the ensuing battle of Gettysburg, which he reached on the second day of the fighting, after making a forced march of 35 miles in 20 hours—a feat nearly unparalleled. So severe was the struggle that his corps was brought into action without being allowed time to rest. It was engaged, also, in the third day's fight and in the pursuit on July 5. During the passage of the Rapidan, Nov. 7, 1863, he succeeded by adroit movements in capturing an entire Confederate division. This service Gen. Meade acknowledged in a general order. At the battle of Rappahannock Station, Nov. 7, he commanded the Union right wing, and in the Wilderness campaign, held the same position, under Grant, exhibiting conspicuous gallantry in the sanguinary battles of May 5 and 6, 1864. At Spottsylvania Court House (May 9), while placing some pieces in position in the entrenchments, in front of the Court House, he was struck in the head by a bullet fired by a Confederate sharpshooter and instantly killed. His loss caused the most profound grief not only in his own command by which he was especially beloved (and which in respect of discipline and morale he had made one of the most efficient in the field), but throughout the whole army to which his many noble qualities had endeared him. He had been offered the command of the Army of the Potomac just before it was conferred on Gen. Meade, but his modesty led him to decline it. He commanded it, however, more than once temporarily in Gen. Meade's absence. A monument, cast from cannon

captured by the Sixth corps, was erected to his memory at the Military Academy at West Point in 1868. (J. H.)

SEDGWICK, THEODORE (1746-1813), jurist, was descended from Robert Sedgwick, one of the settlers of Charlestown, Mass., in 1635, who afterwards, while engaged in the expedition against Jamaica in 1656, received a commission as major-general from Cromwell. Part of the family had gone to Hartford, Conn., and here Theodore was born in May, 1746. He entered the Yale College, and having been rusticated for some offence did not return. In 1766 he was admitted to the bar and practised at Great Barrington and afterwards at Sheffield, Mass. He was an ardent patriot and served in the expedition to Canada as an aid to Gen. Thomas. He frequently represented Sheffield in the State Legislature, and in 1785 was a delegate to the Continental Congress. His services in suppressing Shay's Rebellion were important. In 1788 the Massachusetts Convention, under his guidance, ratified the Federal Constitution. In the same year he was speaker of the assembly, and was elected a member of the first Congress under the new constitution. Here he was conspicuous as a Federalist and a laborious statesman. In 1796 he was elected to the U. S. Senate, of which he was made president *pro tem.* in the next year. In 1799 he returned to the lower house, where he was chosen speaker. At the close of this term he was made judge of the Supreme Court of Massachusetts, and so continued till his death at Boston, Jan. 24, 1813. Sedgwick rendered excellent service in Congress, but his fame rests upon his work in the interpretation of the State laws in behalf of liberty. In 1780 in a fugitive slave case he obtained from a State Court a decision which practically brought slavery to an end. Afterwards while judge he strengthened the decision by pronouncing that "one man could not have legitimate property in another."

His son, THEODORE SEDGWICK (1781-1839), was born at Sheffield, Mass., Dec. 31, 1781. He graduated at Yale College in 1798, and having studied law with his father, was admitted to the bar in 1801. He practised at Albany, N. Y., for many years and in 1822 removed to his father's estate at Stockbridge, Mass. He was elected to the Massachusetts legislature and earnestly advocated the construction of a railroad from Boston to Albany. He was a Democrat in politics, opposed to slavery, and an advocate of free trade. Soon after completing a political speech he died of apoplexy at Pittsfield, Nov. 7, 1839. His published works were *Hints to my Countrymen* (1826), and *Public and Private Economy* (3 vols., 1836-39). The later volumes contain his observations on the continent of Europe in 1836. His wife, Susan Ridley Sedgwick, was a daughter of Gov. William Livingston of New Jersey, and wrote many works of fiction for the young.

Their son, THEODORE SEDGWICK (1811-1859), was born at Albany, Jan. 27, 1811. He graduated at Columbia College in 1829, and was admitted to the bar in 1833. He then became an attaché of the U. S. Legation at Paris. Returning in 1835 he practised law in New York city, was president of the Crystal Palace Association in 1852, and in 1858 was U. S. district attorney. He died at Stockbridge, Mass., Dec. 8, 1859. He published a *Memoir of Gov. William Livingston* (1833); a *Treatise on the Measure of Damages* (1847), and many legal, literary and political addresses.

SEDITION. The distinctive recognition of the principle that the people of the community have a right to mould its government to their interests and desires, which existing as a political tendency in the early colonial institutions of this country, came to a distinct expression at the Revolution,

See Vol. XXI, p. 619 (p. 650 Am. Rep.).

had a necessary tendency to displace the ideas of the duty of popular submission to authority that were derived from monarchical institutions. The enunciation of a measure of popular right in excess of what had been regarded as compatible with governmental stability, and which had never been reduced to an exact statement by actual political experience left an important political problem for experimental solution.

This principle, affirming the popular origin of political authority, was the reason of the Declaration of Independence and the sanction of the armed struggle that established its affirmations. In America the ultimate consequences of the tendencies inherent in this new and bold doctrine were counteracted by inherited English tendencies that estimated political institutions according to historic rather than philosophical interpretations. In France a prepared intellectuality that had appealed from history to reason, and popular aspirations intensified under the pressure of dynastic interests had assured the acceptance of the advanced conception of popular right. The displacement of the historic government of that country opened its institutions to the chances of a conflict between reason, rapacity and revenge that soon demonstrated the instability of government not properly related to antecedent experience.

Profound apprehensions were felt by the conservative portion of the American people for the safety of our own government which was thought to be exposed to the influences that were producing the instability of French institutions to a condition that threatened constitutional order in government. It was apprehended that emissaries of ultra-revolutionary ideas would foment among our people dissatisfaction with their government and with established social order and would embarrass if not overthrow the government. The Federal party then in power sought to relate the institutions of the country to past governmental experiences, while a growing sentiment demanded an unshackled advance to certain ideal conditions that attracted the popular enthusiasm.

The apprehensions excited by the condition of politics in France, induced the enactment by Congress in 1798 of the Alien and Sedition laws. The latter prescribed punishment for seditious libels against the government and its officers and for seditious conspiracies, but the law was a temporary expedient expiring by its limitation in 1801. While this law cannot be regarded as an attempt to establish in this country the common law doctrines in regard to sedition it certainly was a reactionary step that failed through its want of adjustment to the principles of government. As regarded the penalties attached to seditious conspiracy the law is not open to the same criticism, but as an attempt to stifle criticism upon the conduct of the government, it certainly misconceived the tendencies that gave direction to thought and action in America.

The policy of the Federal party in this respect had its roots in distrust of popular institutions that did not contain a reserve of governmental authority that in the end could set a limit to popular tendencies. The theory of popular sovereignty was not freed from the influence of the long prevalent notions of personal sovereignty, and it seemed to many gifted minds that the mechanism of government with its inherent conservative tendencies might still supply a check to popular tendencies. If the idea of popular liberty was not clear at that day the instinct associated with that idea was fixed and potent and was the cause of the overthrow of the policy of repressing popular agitation.

In our colonial life we imported the common law of England that thus became the point of departure for whatever might be the distinctive product

of our peculiar conditions and tendencies. The law of England regarded the raising of commotion and disturbance in the State for the purpose of changing the government or its measures as a revolt against legitimate authority and clothed such conduct with the qualities of a public wrong under the name of "sedition." It is more accurate to say that sedition was a parent stock from which a variety of crimes branched out than to say that it was in itself a distinctive crime. While as affecting the life or security of the person of the sovereign, seditious conduct on the part of a single individual might be of consequence, it was only when numbers united for seditious purposes that the stability and authority of the government could be regarded as in jeopardy, and hence the development of the consequences of sedition dealt mainly with the conduct of associated persons. Viewed on this side sedition implied the assembling together of persons from the motive of hostility to the government or its measures and the conduct attending and resulting from such assembling. An unlawful assembly as punished by the law of England was measured by a very vague standard that in its application left much to the state of the times and to the temper of those administering it. A definition of an unlawful assembly as "any meeting whatever of great numbers of people with such circumstances of terror as cannot but endanger the public peace and raise fear and jealousies among the King's subjects," is a net that can be made to catch great or little fish as circumstances might require. If the object of such an assembly was to enforce some personal right or to redress some personal wrong, without any direct bearing upon the government, the most that would result from an attempt to execute its purposes by force, would be to involve the actors in the consequences of the crime of riot. But, if the object was the redress of public grievances, and force was employed, the responsibility was for the consequences of treason.

As the discussion of radical changes in the structure and policy of government must produce those consequences above described as indicating an unlawful assembly it is evident that the system that gave rise to such definitions of the limitations of popular action was essentially based upon the idea that such changes could not properly originate with the mass of the people. Such a system could have no place in the doctrines of America, and the attempt to graft it upon our institutions was a serious error that had a large share in revolutionizing the state of parties and opinions in the United States. At the present day the term "sedition" hardly has a place in the law language of this country. Its only use in the statutes of the United States is in connection with the regulations for the government of the army and the navy, where sedition is named as a military offence.

The attempt to change the structure or to control or resist the operations of the government by force has not lost the character derived from the institutions of England, for the principles of popular government while giving the utmost liberty to rational methods find no place for brute force. It is true that we have limited the scope of the crime of treason to the case of armed hostility to the government, but in various forms penal consequences have been attached to applications of force to antagonize the operations of the government.

The right of the people to assemble and deliberate upon public grievances is fixed in the constitution of the United States and those of the States, so that the popular assembly, whether deliberating upon changes in the structure or operations of the government or on the conduct of those administering it, is placed upon highest ground of privilege beyond the control of the law-making authority so

long as its deliberations are confined to rational methods to the exclusion of turbulence and violence.

What has been done by constitutional authority to conserve the formation and expression of collective opinion as affecting the government has also been done for the protection of individual opinion. The liberty of speech and of the press secured by all of our Constitutions assures to the individual immunity in the free expression of his opinions, though involving in condemnation the conduct of the government or of its officers, placing such expressions upon the ground of privilege and freeing him from responsibility except for the truth of statements prejudicial to personal character.

These constitutional rights preclude the application of the principles upon which the doctrine of sedition rests to the relations between the citizen and his government so long as force is absent. As the doctrine of Bygone times sought to shield the government from popular criticism the modern constitutional liberty distinctly invites that criticism and bestows upon it the highest immunity. (See STATES' RIGHTS.) (A. J. W.)

SEELEY, JOHN ROBERT, English author, was born in London in 1834. He graduated at Christ's College, Cambridge, in 1857, and became fellow in 1858. He was made professor of Latin in University College, London, in 1863, and professor of modern history at Cambridge in 1869. To him is attributed *Ecce Homo* (1865), a work which produced a profound sensation throughout the English-speaking world. It professed to be a survey of the life and work of Jesus Christ. Discarding all theological systems, the author took the narrative of the Gospels, and endeavored to prove the influence of Jesus to be due to an "enthusiasm of humanity," of which he was the exemplar and advocate. So great was the effect of the book that the author seems to have recoiled from pursuing the plan announced in his preface. Instead of issuing a work on the religious system of the Gospels, he waited till 1882 before publishing *Natural Religion*, a work which has attracted much less attention than his former. In the field of modern history Prof. Seeley has treated with marked ability the themes he has handled. His *Life and Times of Stein* (3 vols., 1879) has made known in English the true source of the recent greatness of the German empire, while the *Expansion of England* (1883) is a graphic presentation of the growth of the British empire. His *Short History of Napoleon I.* (1886) is a severe indictment of the French emperor as a selfish charlatan.

SEELYE, JULIUS HAWLEY, educator, was born at Bethel, Conn., Sept. 14, 1824. He graduated at Amherst College in 1849, studied theology at Andover, and went to Germany for further study. In 1853 he was ordained pastor of the first Reformed Church at Schenectady, N. Y. In 1858 he was recalled to Amherst College as professor of moral and mental philosophy. In 1872 he visited India and delivered lectures to educated English-speaking Hindoos on the truths of Christianity. These were afterwards published at Bombay and Boston under the title *The Way, the Truth, and the Life* (1874). In 1874 the people of his Congressional district, discontented with previous political management, nominated and elected him to Congress. He served but one term, and was chosen president of Amherst College in 1876, while still retaining his professorship. His earnest Christian character has served to raise the standard of education, of public opinion and political action. Besides contributions to reviews and many sermons and addresses, he has published *Christian Missions* (1875).

His brother, LAWRENCE CLARK SEELYE, born at Bethel, Conn., Sept. 20, 1837, graduated at Union

College in 1857, studied theology at Andover, and afterwards at Berlin and Heidelberg. Returning after a tour extended to Palestine, he was ordained pastor of a Congregational Church at Springfield, Mass., in 1863. He was made professor of English literature and oratory in Amherst College in 1865, and in 1874 was called to be president of the newly founded Smith College for Women, at Northampton, Mass. He has contributed to periodical literature on educational topics and has prepared some articles for this work.

SEGUIN, ÉDOUARD (1812-1880), physician, noted for his success in training idiots, was born at Clamecy, France, Jan. 20, 1812. He was educated at colleges of Auxerre and of St. Louis, Paris. While studying medicine with Itard, who had given some attention to the treatment of idiots, Seguin was induced to pursue the subject more thoroughly. In his first experiments he was associated with E. D. Esquirol, and in 1838 he opened a school for this class of patients in the Faubourg St. Martin, Paris. His system received the approval of the French Academy of Sciences in 1845, and he then published *Traitement morale, Hygiène et Education des Idiots* (1846). The revolution of 1848 having interrupted his work at Paris, he visited the United States, where some institutions had already been founded to carry out his ideas. He assisted Dr. H. B. Wilbur in starting the school which grew into the New York State Asylum at Syracuse. In 1851 he settled in Ohio, but he afterwards taught at Syracuse, and then practised as a physician at Mt. Vernon, N. Y. At intervals he was engaged in founding asylums for idiots in other States. In 1863 he settled in New York city, and there enjoyed high repute as a specialist in nervous diseases. In 1873 he was U. S. Commissioner of Education at the Vienna Exposition, 1873, and he prepared the official report on that department. He died at New York, Oct. 28, 1880. To him the medical profession owes the physiological thermometer. Among his publications in English were *Idiocy and its Treatment by the Physiological Method* (1866); *Medical Thermometry* (1871), and several other treatises on these subjects.

SEISS, JOSEPH AUGUSTUS, Lutheran minister, was born near Graceland, Md., March 18, 1823. He was educated at Pennsylvania College, but did not graduate, though he afterwards received the degree of D. D. from this institution. Having studied theology privately, he became pastor at Martinsburg, Va., in 1843. He afterwards had charge of churches at Cumberland, Md. (1847), Baltimore (1852), and in Philadelphia first of St. John's (1858), and later of the Church of the Holy Communion (1874). In 1858 he took part in forming the General Council of the Lutheran Church. He edited the *Prophetic Times*, a monthly, 1863-75, and the *Lutheran* 1873-79, having previously been associate editor for some years. He has published lectures on the Epistle to the Hebrews (1846), on Leviticus (1860), on the Apocalypse (3 vols., 1870-84), on the Gospels (2 vols., 1876), on Daniel (1879), and many other sermons. His millenarian views of prophecy are set forth in these and in *Last Times* (1856). His *Miracle in Stone* (1877) adopts the views of Prof. C. Piazzzi Smyth in regard to the great pyramid of Egypt and pronounces it to be a record and attestation of divine revelation. In *The Gospel in the Stars* (1882), he considers the constellations to be a typical display of Christian truth. His *Ecclesia Lutherana* (1867), *Luther and the Reformation* (1883), and various manuals relate chiefly to his own denomination.

SELBORNE, ROUNDELL PALMER, EARL OF, was born at Mixburg, England, Nov. 27, 1812, his father being rector of that parish. He was educated at Rugby and Winchester schools, and at Trinity

College, Oxford, where he graduated in 1834. He had won prizes for Latin and English verse. He became fellow of Magdalen College, and in 1837 was called to the bar at Lincoln's Inn. He was made Queen's Counsel in 1849, having been already elected to Parliament from Plymouth. In 1852 he was defeated, but in the next year he regained his seat, which he held till 1857. He was then classed as a Liberal Conservative, but afterwards became distinctly liberal. In 1861 he was appointed solicitor-general in Lord Palmerston's administration and was knighted. He became a member for Richmond and represented this borough until he was elevated to the peerage in 1872. He was made attorney-general in Oct., 1863, under Lord John Russell, and retired with him in June, 1866. When Mr. Gladstone came into power in Dec., 1868, he offered to make Sir Roundell Palmer chancellor, but the latter being unable to approve fully the course proposed in regard to the disestablishment and disendowment of the Irish Church, then declined the office, though he continued to support the Government policy on most public questions. He was counsel for Great Britain before the Geneva tribunal of arbitration in 1871. In October, 1872, he was appointed Lord Chancellor of England, and was raised to the peerage by the title Baron Selborne of Selborne. He retired with Gladstone in February, 1874, and returned to his former office when the liberals were victorious in 1880. In December, 1882, he was created Viscount Wolmer, of Blackmoor, and Earl of Selborne. He retired again with Mr. Gladstone in 1885. Sir Roundell Palmer was noted not only for his legal labors, but also for his literary attainments. His *Book of Praise* (1862) is an admirable selection from the best English hymn writers. In 1863 he received the degree of D.C.L. from the University of Oxford, and in 1877 he was elected Lord Rector of the University of St. Andrews.

SELMA, a city of Alabama, county seat of Dallas co., is on a bluff on the right bank of the Alabama river, 100 miles N. of Mobile. It is at the intersection of several railroads leading to Mobile, New Orleans, Memphis, and Atlanta. It has a courthouse, a national bank, savings bank, 2 academies, 20 churches, and 1 daily and 2 weekly newspapers. The industrial works comprise iron works, cotton factories, planing mills, car shops, and other manufacturing. A large trade in cotton is carried on. The town is lighted with gas. In 1880 it had a population of 7529.

SELWYN, GEORGE AUGUSTUS (1809-1878), an English missionary bishop, was born at Richmond in Surrey, being son of William Selwyn, Q. C., of some repute as the author of a work on *The Law of Nisi Prius* (1806-8). George was educated at Eton and at St. John's College, Cambridge. After being for a time tutor at Eton and curate at Windsor, he was consecrated first bishop of New Zealand in 1841, and in this post, which he filled for 26 years, won great reputation for apostolic zeal and efficiency. In his own small vessel, *The Southern Cross*, and often at great personal risk, he visited the South Sea Islands, and thence brought to New Zealand native youths whom he instructed and sent back as missionaries. J. C. Patteson, afterwards bishop and martyr (for whom see *ENCYCLOPEDIA BRITANNICA*), became his assistant in this part of the work in 1855. His jurisdiction was divided in 1857. He was recalled to England in 1867, having been appointed Bishop of Lichfield and administered his diocese with great energy and success. On a visit to the United States in 1874 he was received with much attention, as one of the most eminent and beloved British prelates. His publications include *Are Cathedral Institutions Useless?* (1838), *Remarks on Cathedral Reform* (1839), *Sermons* (1842), a *Charge* to his clergy (1849), *The Work of Christ in the*

World (1855), and a *Verbal Analysis of the Bible* (1855). He died at Lichfield April 11, 1878; his *Memoir* was written by H. W. Tucker (2 vols. 1879). His son succeeded Patteson as Bishop of Melanesia, and his brother, WILLIAM SELWYN (1806-1875), was divinity professor at Cambridge from 1855, author of several books, and a reviser of the translation of the Old Testament.

SEMINOLES, a tribe of Indians, whose name is associated with the history of Florida, now reside chiefly in Indian Territory. They belong to the Creek or Muscogee family, and having separated from the main body in 1750, were called Seminoles or "wanderers." Parts of other tribes joined with them; and during the American Revolution they gave much trouble to the people of Georgia. In 1784 the Spaniards, having recovered Florida, made a treaty with the Tallapoosas and Seminoles. The latter claiming to be a distinct tribe, repudiated the treaty made in their behalf with the United States by the Creeks in 1790. They soon began to make raids into Georgia and afforded refuge to fugitive slaves. The Creek war of Northern Georgia extended to them, and one of their forts being destroyed they took revenge by the massacre of Lieut. Scott and others. Gen. Gaines drove them from Georgia, and Gen. Jackson pursued them into Florida and destroyed their towns. In 1819, when Florida was purchased by the United States, they were found to number less than 4000 Indians with about 800 negroes. As they roamed over the whole country efforts were made to dispossess them. By the treaty of Fort Moultrie, Sept. 18, 1823, but somewhat modified in the following January, they gave up most of their lands for annuities which would amount to \$100,000, agreed to deliver up fugitive slaves, and accepted small reserves of land. But the white settlers pressed for their complete removal, and in 1832 Seminole chiefs were deluded into making a treaty for this purpose at Payne's Landing. Although this treaty was rejected by nearly all the tribe President Jackson and the U. S. Senate determined to enforce it. When the chiefs opposed the attempt, Gen. Thompson, the U. S. agent, undertook to depose them, and arresting Osceola, put him in irons. On Dec. 28, 1835, Osceola killed Thompson, and inaugurated a bloody war which cost the United States over \$10,000,000 and 1500 lives. Though the Seminoles struggled bravely, most of them early in 1837 agreed to emigrate. Osceola, however, still fought until he was treacherously seized in October. In 1839 there had been 1900 Seminoles removed to the Indian Territory, where they were handed over to the Creeks. Many of them dissatisfied with their treatment went on to the Rio Grande, and their descendants are still to be found in Mexico. In 1845 and 1856 better treaties were made with those in Indian Territory, giving them a separate reservation. Those who still stayed in Florida had sought refuge in the Everglades, under their chief Billy Bowlegs, but finally most of these also emigrated in 1858. All told, 2254 Seminoles were then found in Indian Territory. The tribe divided on the outbreak of the civil war, and the Confederate government made a treaty with the larger portion, assuming all the obligations of the United States towards them. The loyal Seminoles were defeated in a severe fight on Dec. 25, 1861, and retreated into Kansas. In 1865 they rejoined the main tribe, and their old reservation being purchased by the U. S. government, they obtained a new one from the Creeks. A census showed their number 2959, including some negroes. There were others in Florida and Texas. Those in Indian Territory have made considerable improvement under the training of Presbyterian missionaries. Under the treaty of 1866 they receive an annuity of \$25,000, besides \$2500 for schools and \$1000 for

government expenses. In 1887 they were reported as numbering 3000, who all wear citizens' dress; 1200 use English sufficiently for ordinary conversation and 800 can read. There are 8 churches with 500 church members. They have about 6000 acres under fence and cultivated. Efforts have been made in recent years to set apart homesteads in Florida for those still remaining there, but no land has been found unlocated which the Indians are willing to accept. These are said to number 892.

(J. P. L.)

SEMMES, RAPHAEL (1809-1877), Confederate naval officer, was born in Charles county, Md., Sept. 27, 1809. He entered the U. S. navy in 1826, but afterwards resigned and engaged in the practice of law in his native State. In the Mexican war he again entered the service, and when his vessel was lost during the siege of Vera Cruz, he joined Gen. Scott's army as a volunteer. His experience then furnished material for his *Service Afloat and Ashore* (1851), and *Campaign of General Scott* (1852). In 1855 he attained the rank of commander, and he was made secretary of the Lighthouse Board. When the Southern Confederacy was organized he resigned and went to New Orleans. Taking command of the sidewheel steamer Sumter, he dashed through the blockading squadron at the mouth of the Mississippi. His career of destruction has been narrated under **ALABAMA CLAIMS** (q. v.). Before the war closed he had returned to Mobile, and on its capture he was imprisoned for some months, but was released without trial. He was afterwards an editor at Memphis, then a professor in New Orleans, and a lawyer in Mobile. He published *Cruise of the Alabama* (1864), and *Memoir of Service Afloat during the War between the States* (1869). He died near Mobile, Aug. 30, 1877.

SENECA FALLS, an incorporated village of Seneca co., N. Y., is on the Seneca River, 10 miles from Seneca Lake, and 2 miles W. of Cayuga Lake. It is 16 miles from Auburn and 62 miles from Rochester, on the Auburn Branch of the New York Central Railroad. It has short railroads to Waterloo and to Cayuga Lake. It contains an opera-house, a national bank and 2 other banks, 4 hotels, 7 churches, 5 schools and has 2 weekly newspapers. The river here falls 50 feet and furnishes motive power for 4 flouring mills, 1 woolen mill, 1 knitting mill, 5 foundries, and manufactories of steam fire engines, pumps and agricultural implements. The village is lighted with gas and has waterworks and a park. Its property was valued at \$30,000,000; the public debt is \$30,000 and the yearly expenses \$25,000. It was settled in 1787 by Job Smith, and was incorporated in 1831. The population in 1880 was 5880.

SENECAS. See **IROQUOIS**.

SEPTUAGINT. A few years ago, it was customary among scholars utterly to discredit

See Vol. XXI, p. 668 (p. 669 Am. Rep.).

the traditional accounts of the origin of the Septuagint, and to assign very late dates to the making of the successive parts of this translation. Of late years, there has been a decided and healthy reaction against this extreme opinion. A majority of living scholars, probably, would agree with Prof. J. Wellhausen, in his statement in the **ENCYCLOPÆDIA BRITANNICA**, that the letter of Aristæus, the principal source of information concerning the origin of the Septuagint, was written as early as the earlier half of the second century B. C., and that the translation itself may probably have been begun in the times of Ptolemy Philadelphus, and was certainly finished, so far as the canonical books are concerned, some time before 130 B. C. When, however, he says that the Septuagint "was in great part composed before the close of the canon—nay, before some of the Hagiographa were written," his impli-

cation as to the lateness of the date of some of the Hagiographa, and of the closing of the canon would not be so widely accepted.

Beyond certain general facts, no statements now made concerning the Septuagint can be regarded as final. Good preliminary work is now being done on it in the way of textual criticism, but ripe results in regard to the text are still an affair of the future. And any one who has read the statements currently made as to the external testimony to the Septuagint, and has dipped somewhat into the original sources of this testimony, knows that a wider and better induction of facts is as much needed in this field as in that of Septuagint textual criticism.

The article in the **ENCYCLOPÆDIA BRITANNICA** avoids the very common mistake of attributing to Aristæus or Josephus the statement that the Septuagint had miraculous sanctions. An account of these alleged miracles is given by Philo, and a different account by Epiphanius, and the miracles are alluded to by other Christian writers, but there is nothing of the kind in Aristæus. Our author further mentions certain guarantees of its own antiquity and of trustworthiness in at least some points, found in the letter of Aristæus itself—the ante-Seleucid character of what it says about the Jews, for example, and its peculiar correctness in details, as confirmed by papyri and inscriptions of the times of Ptolemy Philadelphus. He regards it as not intrinsically improbable "that the scholarly taste of the Alexandrians, personified in Demetrius Phalereus as the presiding genius of the Alexandrian library, could have furnished the stimulus to reduce the translation to writing." That this was actually the case, however, he seems to deny, holding that Demetrius died so early in the reign of Philadelphus that he cannot possibly have done this work. But the epistle of Aristæus does not so much as mention that the king of whom it speaks is Philadelphus, though the reader may gather this fact by inference. In some of the other traditions, the name of Ptolemy Lagus is connected with the Septuagint. Remembering this, and remembering that Ptolemy Lagus lived perhaps two years after he placed Philadelphus on the throne, 285 B. C., we see that it is not improbable that Demetrius may have had something very important to do with the actual placing of the Judæan sacred books in the Alexandrian library. So far as appears from all known sources of evidence, he may have remained in Alexandria, and may have been employed in literary work there, till after the death of Lagus; and this fact must be allowed to limit the statement that he "fell out of favor at the very beginning of the reign of Philadelphus." The statement of Aristæus that when the interpreters had agreed upon a section, Demetrius wrote it down, may naturally mean, as some of the Christian Fathers seem to have understood it to mean, that he furnished professional writers to do the writing. On the whole, it is hardly fair to the letter of Aristæus to call it a forgery and spurious and accuse its author of mendacity. The letter seems to be a professed fiction based on fact, designed largely to place the philosophical questions it discusses in an interesting light. The problem is to distinguish, if possible, the historical basis of fact from the fiction based upon it.

From various Jewish and Christian sources there may be gleaned a few statements of fact in regard to the origin of the Septuagint, that are independent of Aristæus. In the Rabbinical writings may be found the mention of the five scribes who wrote for Ptolemy, and various other allusions to the translation, coupled with a most scrupulous abstinence from directly recognizing it by citing from it. In Philo and in Justin Martyr, Epiphanius, and other Christian Fathers, we have details of circumstances, especially dwelling upon the division of

translators into pairs, and upon the miraculous correspondence of their Greek with the original, or of the changes made by some of the translators with those independently made by others. Not to dwell upon these, two passages out of many may be cited, as containing matters of special interest. The first is the testimony of Aristobulus, as given to Eusebius, *Præp. Evang.*, XIII. xi. (See Migne's *Patr. Græc.*, Vol. xxi., col. 1098. Also the *Stromata* of Clement, I. xv., xxii., in Migne, Vol. viii. 781, 889-893):

"It is evident that Plato followed our law, and he was evidently a careful student of everything in it. For there had been translated before Demetrius Phalereus, through others, before the conquest of Alexander and the Persians, the matters pertaining to the going forth of the Hebrews, our fellow citizens, from Egypt, and the manifestation of all that happened to them, and the conquest of the land, and the detailed account of the whole legislation. . . . But the whole translation of all things pertaining to the law was in the time of him called King Philadelphus, thy ancestor, . . . Demetrius Phalereus being active in these matters."

These words are addressed to Ptolemy Philometor, who reigned B. C. 181-146. The other passage is from the *Stromata* of Clement of Alexandria, who lived, say, A. D. 160-215. (Migne, Vol. viii. 894):

"They say the Scriptures, both of the law and the prophetic, to have been interpreted from the dialect of the Hebrews into the Greek tongue in the time of King Ptolemy Lagus, or, as some say, of the one called Philadelphus, Demetrius Phalereus bringing to this the greatest ambition, and providing the things concerning the interpretation."

Probably no one doubts that the conclusions of Clement, though he was a Christian, fairly represent the Alexandrian Hellenistic traditions.

There is no room in this article to exhibit a collection of the numerous items of evidence of which these are specimens, or to discuss their text, or their relative historicity; but attention should be called to certain statements of fact which are greatly neglected, but which are a part of the evidence as it stands. To the extent to which these differ from opinions commonly received, they are here presented rather as questions for inquiry than as final facts.

It is generally agreed, on the basis of the internal character of the Septuagint, and in opposition to most of the external testimony, that the translation is certainly the work of Alexandrian Jews, and not of men whose education was Palestinian. It is further agreed that the translations of the different parts of the canonical books are not all by the same groups of men, or of the same date.

On the strength of the external testimony, uncontradicted by any of the internal marks, or by any of the probabilities of the case, we ought to hold that about 285 B. C., the date at which Ptolemy Philadelphus succeeded Ptolemy Soter, some arrangement was made for putting the Jewish sacred books in the Alexandrian library, and some correspondence was had with the Palestinian Jews for this purpose. Very likely much that is said of the agency of Demetrius in the matter is fabulous; but he seems to have had something to do with it, and that fixes the date, as we have seen, to a time when Lagus was yet living. Perhaps Lagus really had as much to do with it as Philadelphus, though the latter, surviving Lagus and Demetrius, got the credit. Any possible use to which these books were put, in the synagogues or the schools, would of course not interfere with their availability for the library.

In a great variety of ways, both directly and by implication, the testimony affirms that portions of the Jewish sacred books were accessible to Greek-speaking people, in Egypt, before this translation

was made, and that Greek philosophers and literary men actually used them and drew from them as sources. We have found Aristobulus asserting that this was the case even before the conquests of Alexander and the Persians. This statement is very generally regarded as unreasonable; critics on one side ridicule it as discrediting the whole passage, while those on the other side offer explanations of it. But recent explorations confirm the statements of the Hellenists in regard to Greek elements in Egypt as early as the times of Nebuchadnezzar, and show it to be not unlikely that Jeremiah and his fellow exiles in Egypt may there have come into contact with Greeks. But laying all this aside, there is every probability that for a generation or more before the accession of Philadelphus, the Greek-speaking Samaritans and Jews in Alexandria, with Greeks who were interested in foreign literatures, had made some progress in turning the Scriptures into both oral and written Greek.

Among the neglected points in the testimony is the statement, often repeated, that Ptolemy had the sacred books transcribed, as well as translated. Demetrius said to the king: "It has been told me that there are laws (*νόμους*) of the Jews worthy of being transcribed and placed in the library." In reply to the king's question as to what difficulty there was in the way of acquiring them, Demetrius mentioned, among other things, their being written in a peculiar character, like that of the Syrians, though not the same with it, *Aristæus* in Hody, page ii. Later, Demetrius says: "For the laws (*νομοθεσίας*), which we wish not only to transcribe but to interpret, concern all the Jews," page iii., and *Jos. Ant.* XII. ii., 2. And so the account proceeds throughout *Aristæus* and *Josephus*. *Epiphanius* says substantially the same thing, and *Lightfoot* has shown (in several places, see index of his works) that the Talmudic passages referring to what was done by Ptolemy contemplate a transcription; the more natural understanding. *Lightfoot's* inference is that the Talmudists recognize no translation, but only a transcription; the more natural understanding of the whole testimony is that there was both a transcription (perhaps a transliteration of the Hebrew in Greek letters) and a translation, and that the traditions have largely confused the two, occasionally asserting of the one something that would be true of the other. In this way, for example, the tradition concerning the participation of the Jerusalem Jews in the affair might be plausibly accounted for. It is certain that they had not much to do with the translation, but their assistance may have been very important in preparing the transcription.

This becomes the more important when we notice that, according to the testimony, the great care taken by Ptolemy was for the purpose of securing a correct text, Hody, page v., *Jos. Ant.* XII. ii., 3, 10 (4, 11), etc. So far as appears, the king might have ordered a copy of the Jewish books for his library from any large vendor of books, but what he wanted was not some copy or other, but a perfectly authenticated copy. There is nothing to contradict the idea that the transcription, supposing it to be true that there was a transcription, may have been such a copy. The idea of taking pains to secure such a copy, even at very great cost, is quite in accord with other things that were done in Alexandria in those days. And if the Jewish scribes of the law were then as painstaking as they were a few centuries later, and had here an opportunity to show their highest skill, it must have seemed to the appreciative courtiers of the king so wonderful as to attract attention; it would be a plausible theory that this fact of the wonderful accuracy of the transcription was the nucleus around which, later, gathered the fables transmitted by Philo and the

Christian Fathers, as to the miraculous accuracy of the translation.

Contrary to the opinion now commonly held, the books which it was proposed to put in the king's library were, if the testimony in the case is to be believed, not the books of the Pentateuch merely, but the books of the Jewish law in the wider sense of the term. In the article in the *ENCYCLOPÆDIA BRITANNICA* it is said that the author of the letter of Aristæus "limits canonicity to the law and knows of no other holy book already translated into Greek." Now it is true that the author of the letter designates the books that were to be translated as the law, but he nowhere gives any hint that he means by the term the five books of Moses as distinguished from other works of prophetic origin. Throughout the Old Testament, the word law is used in a sense wide enough to include all divine requirements made known through the prophets, and therefore, of course, all requirements so made known in writing. In the New Testament, it is frequently used in the same wider meaning. There is no presumption against its having this same wide meaning in the accounts of the origin of the Septuagint, as given by Aristæus and Josephus. We are not now inquiring, let us remember, whether the testimony is to the effect that the plan was actually carried out, so that the other books were translated at the same time with the Pentateuch: nor are we directly inquiring whether the Old Testament canon was then complete in the shape in which it is now accepted. Whatever be the answer to either of these questions, it is evident that the Aristæan account may supposably mean, by the term law, not the Pentateuch by itself, but the whole range of writings that were then regarded as having been divinely given through the prophets, the Pentateuch being of course included.

It is not only true that this may be the meaning, but that this is the most natural meaning. No one disputes that most (not to say all) of the Old Testament books had then been written and were well known; or that they were attributed to prophets, and therefore regarded as of the nature of prophetic *Thrah*. The Alexandrian library was an affair of tens of thousands of volumes. The king proposed to gather into it all the literature of the world. It is not natural to hold that he would be content with only a small section of the Judæan sacred literature, unless the evidence distinctly specifies that this was the case; and there is no such specification. On the contrary, the language currently employed both in Aristæus and in Josephus is such as constantly to suggest that the books spoken of are a considerable number of volumes—a more extensive literature, certainly, than the five books of the Pentateuch. Among the expressions employed are: "The books of the law of the Jews, with some few others," "the books of the legislation of the Jews, with others," "many volumes of their usages (*νόμοι* . . . τῶν πατρῶν νομίμων συγγραμμάτων)," "make a collection of them," "the Jewish books." When the seventy come to the king, they bring, not the one roll of the Pentateuch, but several volumes, made each of skins so closely joined that the king could not find the seams; and when the king had inspected them, they restored the various documents (*τετραχ*) to their proper order. In view of the advice of Demetrius to take measures for obtaining these Judæan writings, it is represented that the king "thought that Demetrius was very zealous to procure for him the multitude of the books." It needs no pressure upon these and similar phrases to make them justify the inference already drawn from them. Indeed, if by the law we understand the Old Testament canon, then the phrase "the books of the law of the Jews, with some few others," is an accurate description of the Septuagint as it has

actually existed since the second century B. C., while it would be difficult to give a precise definition to the phrase, on the supposition that by the law it means the Pentateuch.

But it is sometimes alleged that Josephus has testified to his own opinion of the proper interpretation of this testimony, in the following passage in the Preface to the *Antiquities*, sec. 3, where he says of Ptolemy:

"For he did not succeed in obtaining all the record (*διαγράφη*), but those who were sent to Alexandria in the matter of the *exegesis* transmitted only what was of the law, while the affairs published through the sacred literature (*γραμμάτων*) are myriads."

Many take it for granted that by the law Josephus here means the Pentateuch, and by the records and the sacred literature he means the other Old Testament books. But if this were the case, his position would be too evidently false to be plausible. He says that the one reason for writing his *Antiquities* is that he may place within the reach of the Greeks such of the contents of this "record" and "sacred literature" as had not been rendered accessible by the translation of Ptolemy; but when he penned this, all the Old Testament and some of the Apocrypha had been thus accessible for two centuries or more, whether Ptolemy made the translation or not. Unless this passage in Josephus is mere nonsense, the other sacred literature which he here proposes to open to the Greeks must be the secondary sacred books which he uses in different parts of his narrative, and the law, whose translation he here ascribes to Ptolemy, is the Old Testament, and not the Pentateuch alone.

The extra-Aristæan testimony to the same effect is explicit and abundant. We have found Aristobulus testifying that the history of the exodus and of the conquest and all the legislation, that is, apparently, the contents of the Hexateuch, had been translated before Ptolemy Philadelphus, and that, in contrast with this, the work of Philadelphus was the whole translation of all things pertaining to the law. Clement held that the works translated under Demetrius were "the Scriptures, both of the law and the prophetic." The whole line of the Christian patristic testimony is to the same effect, with great abundance of details. Philo and the other earlier Jewish witnesses are simply silent; their testimony occurs in passages where only the Pentateuch is under consideration, and nothing at all is either said or implied concerning the other books.

Among the great questions now under discussion by scholars there are two in regard to which the testimony of the Septuagint is of especial importance: the question of the canon of the Old Testament, and the question of its text.

The fact that copies of the Septuagint contain writings not found in the Hebrew is sometimes urged in proof that the Alexandrian canon of the Old Testament differed materially from that accepted in Palestine. That the truth of this view depends partly on the definition given to it, and that it is untrue in any sense that would justify the inference that the canon of the Old Testament was still unsettled among the Jews of the century before Christ and later has been shown in the article on CANON, in this work.

Among the groups of scholars who formerly most insisted on the alleged differences between the Alexandrian and the Palestinian canons, there seems to have been some change of opinion during the years since the present edition of the *ENCYCLOPÆDIA BRITANNICA* began to appear. Prof. Wellhausen, in the article on the SEPTUAGINT, distinctly says that "in some measure the widening of the Old Testament canon in the Septuagint must be laid to the account of Christians;" and he is speaking

of the canon in Hebrew when he says: "Learned Hellenists were quite well aware of the limits of the canon, and respected them." One cannot logically say this without admitting that the Septuagint, as existing, gives its evidence in favor of the accepted Hebrew canon.

But what does the evidence of the Septuagint amount to in regard to the Old Testament canon of 285 B. C. and earlier?

First, as we have already seen, it is not a witness in favor of the proposition that canonicity was then limited to the Pentateuch. On the contrary, the whole body of the external testimony is to the effect that there was then a clearly recognized body of Jewish sacred law, having its own limits, and much wider than the Pentateuch. There is nothing in the internal phenomena to contradict this. To what extent certain parts of the translation were later than others is a matter yet to be determined; precisely what plans were formed in the times of Philadelphus in regard to the Jewish Scriptures, and how far these plans were carried out, may be matter of doubt; but in this there is nothing to contradict the testimony that attributes to the men of those times the holding of a distinct idea of this body of writings concerning which it was possible for them to form their plans. They knew of a body of Jewish sacred writings described as the law. This law was not the Pentateuch, but a larger body of writings, including the Pentateuch. If our present Old Testament was then in existence as a collection of books, the term law is a natural term for them to apply to it. What they proposed to translate was the law and a few other Jewish books; from about the time when the letter of Aristæus was written, the translated part of the Septuagint has consisted of the Old Testament and a few other books. These facts are of some weight as indicating that our present Old Testament canon was recognized at the beginning of the third century B. C. If they are compared with facts drawn from other sources, they will gain force, instead of weakening.

The remaining question is as to the value of the Septuagint for testing or correcting the Masoretic text of the Old Testament. In reaching conclusions upon this, a few undisputed facts should be kept steadily in mind. From a date earlier than the earliest existing copies of the Septuagint, the Masoretic text has been handed down with a scrupulous care not paralleled in the history of other writings. It is traditionally claimed that this care in transmission goes back to the times when the books were written and collected. There is considerable evidence that might be gathered in support of this claim. Apart from the Septuagint variants, there is no strong proof against it. The variants in the duplicated passages in the Old Testament are not proof of this sort, for they are ordinarily to be regarded as editorial, and not as transcriptional. Prof. Wellhausen in the *ENCYCLOPEDIA BRITANNICA* urges the occasional infelicities of the Hebrew text as proof. With commendable piety, he speaks of "the design of Providence, which has permitted the Old Testament text to reach us in a form that is often so corrupt as to sin against both the laws of logic and of grammar—of rhetorical and poetical form." But really, the instances of a false use of language in the Old Testament are relatively very few; they are not more numerous or more important than are to be expected in such a literature; there is no need of regarding most of them as transcriptional errors, for they are sufficiently accounted for by the state of literary culture existing among their authors. If a collection of writings like these, written by many different men, most of them men whose peculiarities and native vigor have not been polished away by special training, presented no difficulties to one who would parse or translate them, that very circum-

stance would justify a suspicion that some one had corrected the text, and edited out the original peculiarities of it.

If the character of the Masoretic text as a standard text scrupulously transmitted has actually come down to us from the centuries before Christ, then it is of the highest possible order of trustworthiness; and among those who deny it this preëminence, no one would hesitate to say that it is a text of high character, as compared with other texts. When men apply to it such terms as bad and corrupt, they use language relatively; as a text it is not to be classed somewhere from low to medium, nor even from medium to high, but somewhere between high and highest. On the other hand, the different copies of the Septuagint, by universal admission, have rather a low value for trustworthiness. Whether we inquire into the Hebrew scholarship of the translators, or their Greek scholarship, or their probable faithfulness in following whatever text they had, the best that can be said of them is that they did as well as could be expected. Their work is partly translation, partly paraphrase, partly comment, partly abridgment. Doubtless it was originally of this character, and these original variations have been augmented by copyists. The existing copies differ greatly among themselves.

Provided these admitted facts be kept in mind, and allowed their due weight in every process, no one need hesitate to regard the Septuagint as an important aid in the study of Old Testament textual criticism. One need not even hesitate to use the extreme rule laid down by Prof. Wellhausen in the *BRITANNICA*, that in looking up variants for the Masoretic text, "we must not confine ourselves to one recension, but use all recensions that our MSS. offer." But when we come to estimate the value of one of these variants, as compared with the reading of the Hebrew, and ask the question whether we should substitute the variant for the Masoretic reading, we have no right to forget the immense difference in trustworthiness between the two witnesses; and if we remember this, the cases will be very few indeed in which any Septuagint variant is preferred to the Masoretic reading.

The fact that a Greek phrase in the Septuagint can be translated into a Hebrew phrase by no means proves that the Greek translator found that particular Hebrew phrase in his copy. The rule that "the proof that a reading is good is simply that it necessarily carries us back to the Hebrew variant, and cannot be explained by looseness of translation" is a good enough rule for these cases, provided it be strictly construed; but the cases in which it is strictly necessary to suppose a false reading in the Hebrew, in order to explain the phenomena of the Septuagint, are not numerous.

Literature. The articles on the Septuagint in the leading Bible Dictionaries are full, and give the literature of the subject. That in *Smith's Bible Dictionary* is especially elaborate. The *Old Testament in Greek according to the Septuagint*, by Dr. Henry Barclay Swete, Cambridge University Press, is a particularly valuable edition of the text (Vol. I., *Genesis to 2 Kings*, 1887).

(W. J. B.)

SEQUOIA, a genus of coniferous trees, of the

Cupressinea or cypress family, their nearest alliance being the *Taxodium*, the bald cypress of the Southern United States and Mexico. They differ from the cypresses proper in having the scales of the cones arranged in spirals, like those of the pines, instead of in pairs, or whorls of three. There are two species only, both remarkable for their size, and both mainly confined to California. *S. sempervirens*, commonly called Redwood, is found only on the Coast Ranges, extending from Monterey Bay into Oregon, but is most abundant

See Vol.
XX. p. 673
(p. 705,
Am. Rep.).

north of the Bay of San Francisco. Here it forms extensive forests, being, with the exception of its related species, the largest of the many immense trees of the Pacific slope region. This species bears small, oval cones, each of the wedge-shaped scales usually containing 5 seeds with wing margins. The leaves, unlike those of the cypress, are spirally arranged on the branch, and densely clothe the twigs with their bright green foliage. The bark of the *Sequoia* is of a peculiar fibrous texture and of great thickness. Externally it is of a rich dark-brown color. *S. sempervirens*, where it abounds, does so almost to the exclusion of other trees, and forms extensive forests. A magnificent spectacle is presented by these forests, extending as far as the eye can reach, of thickly grouped trees 8 to 12 feet in diameter, and 200 to nearly 300 feet high, their trunks of arrow-like straightness, and without a branch till they reach a height of 100 to 150 feet, then spreading into a dense canopy of deep green glossy foliage. Individuals have been observed of from 50 to over 75 feet circumference, and 275 feet high, while there are stories of still larger ones.

The redwood is the most valuable of California timber trees, and is rapidly disappearing before the axe of the woodman. The wood is light but firm, straight grained, of a handsome red color, and polishes well. It is valuable for interior decoration, and as durable as red cedar for posts. The tree is very tenacious of life, old stumps long retaining their vitality, and sending out fresh shoots. It has been tried in the Eastern United States, but does not flourish; yet it grows well in England, where it forms a handsome park tree.

The remaining species, *S. gigantea*, is a tree of surpassing interest, not for its beauty, it being much less attractive in appearance than *S. sempervirens*, but for its immense size, and its position as the unquestioned giant of the vegetable world. This species is still more contracted in range than the former, being confined to the western slope of the Sierra Nevada, and to a range of 2° or 3° in latitude, occurring only between elevations of 4700 to about 7000 feet. It bears small, awl-shaped leaves, paler in color and less graceful in arrangement than those of the coast redwood, its branches are short, and its head of foliage lacks the spreading grace of the other species. The cones are thrice as large, the color of its bark and wood similar, but the latter a duller red. It is much less abundant, occurring generally in detached groves, mingled with other coniferous trees. Its claim to distinction lies in its immense height and bulk. Individuals now stand of 325 feet in height, and there is reason to believe that others known attained from 400 to 450 feet. This height is equalled, and perhaps exceeded, by the giant *Eucalypti* of Australia, but the latter are immensely surpassed in bulk by the "Big trees" of California, some of which are certainly over 90 feet, while others are said to have measured over 100 feet in circumference at base.

The most northerly of the Big trees are two groves in Calaveras county. These were the first known, being discovered in 1852 by a hunter named Dowd, who led a party of miners thither. The earliest scientific description was published by Dr. Lindley in 1853, who named the tree *Wellingtonia gigantea*. The California botanists, with patriotic sentiment, changed this name in 1854 to *Washingtonia gigantea*. Meanwhile Dr. Torrey had obtained some of the flowers, and determined that the tree was of the same genus as the coast redwood, which had been named *Sequoia* by Endlicher in 1847. It therefore has since borne its proper name of *Sequoia gigantea*.

The most important of the Calaveras groves has still four trees of over 300 feet, the tallest being 325 feet high, and 45 feet girth at 6 feet from the

ground. The stump of one which has been cut down measures 23 feet diameter, and 24 feet in one direction. Its rings of annual growth indicate an age of about 1300 years. One tree, 327 feet high and 90 feet circumference at base, was stripped of its bark to the height of 116 feet for the purpose of exhibition. The greatest tree is one which was found prostrated and broken off at a height of 300 feet. At this point it is 18 feet diameter, and is said to have been 112 feet in circumference at base. This, as it tapers regularly, would indicate a total height of about 450 feet.

Sequoia Gigantea.

(Stripped of bark to the height of 116 feet.)

South of this grove are two or three others, but none of special importance till the Mariposa grove is reached, 16 miles south of the Yosemite Valley. There are two patches here, the lower one at a height of 5500 feet. This contains 125 trees of over 40 feet circumference. One, known as the Grizzly Giant, is over 93 feet circumference at base, and

over 64 at 11 feet from the ground. Remains of still larger trees lie on the ground. Many have been sadly injured by fire. The tallest is only 272 feet high, and thus not equal to those of the Calaveras grove. The Mariposa grove has been set apart by Congress as a national park, and is under the charge of a government guardian. About 12 miles south of this is the Fresno grove, which is said to have about 600 trees, the largest being 81 feet in circumference. From this place south to the Tule River the Big trees seem more abundant, and more generally dispersed through the forest. Some trees are supposed to be over 2000 years old, but botanists doubt if this age is much exceeded. The timber of this species is of no great value, though the heart wood, varying from reddish to deep brown, has been used in cabinet work.

S. gigantea, like its congener, *S. sempervirens*, seems to thrive in England. The genus can be traced to a remote geological age, fossil traces of it being found in the older Cretaceous. It is represented by 7 or 8 species in the Tertiary, and seems to have grown all round the Arctic zone, extending in Europe as far south as Greece, and in western America at least to Oregon. One Tertiary species closely resembles *S. gigantea*. (C. M.)

SEQUOYAH, Indian chief. See GUESS.

SERGEANT, JOHN (1779-1852), lawyer, was born at Philadelphia, Dec. 5, 1779. His father, Jonathan Dickinson Sergeant (1746-1793), also an eminent lawyer, had been a New Jersey delegate to the Continental Congress, but settled in Philadelphia before the close of the Revolutionary War. The son graduated at Princeton in 1795, had a brief experience of mercantile life, then studied law and was admitted to the bar in 1799. In 1801 President Jefferson appointed him a commissioner in bankruptcy, and he served some terms in the Pennsylvania legislature. Entering Congress in 1815 he took part in the struggle which resulted in the Missouri Compromise, and thenceforth was closely attached to Clay. He retired from Congress in 1823, but was again a member 1827-29 and 1837-42. In 1826 he was appointed one of the envoys to the abortive Panama Congress and in 1832 he shared Clay's defeat, being the National Republican candidate for vice-president. In 1837 he was chosen to preside over the Pennsylvania Constitutional Convention. Honorable and learned, he was a leader in his profession, and was engaged in the most important cases before the U. S. Supreme Court. His last public service was as arbitrator in settling a long pending controversy between the Federal Government and the State of New Jersey. He died at Philadelphia, Nov. 23, 1852. His *Select Speeches* were published in 1832.

SERPA PINTO, ALEXANDRE ALBERTO DA ROCHA, a Portuguese explorer of Africa, was born at the Tendões, in Douros, Portugal, April 20, 1846. He was educated at the Royal Military College, Lisbon, and entered the infantry in 1863. He served as lieutenant in the Zambesi war in 1869, and distinguished himself at the battle of Masangans, Nov. 23, where he had command of a native troop. He became major in 1877, and then crossed Africa from Benguela to Durban. His explorations obtained for him high honors from the principal geographical societies of Europe and from the King of Portugal. In 1884 he undertook with Cardoso an expedition for the exploration of the country between Mozambique and Lake Nyassa. Their journey though interrupted by sickness was rich in geographical discoveries, and extended the Portuguese protectorate over many tribes of the interior. In 1887 Serpa Pinto was dispatched on diplomatic missions to East Africa. His chief work is *How I crossed Africa* (1881).

SERRANO Y DOMINGUEZ, FRANCISCO, DUKE DE LA TORRE (1810-1885), Marshal of Spain, was

born at Arjouilla, Andalusia, Sept. 17, 1810. His father, General Serrano y Cuenca, distinguished himself in the war against Napoleon. The son early entered on a military career, and having joined the party of Queen Maria Christina, was by her influence made general at the age of 30. He worked for the downfall of Espartero in 1843 and after the queen-mother's restoration assisted Narvaez in his opposition to Olozaga. In 1845 he was made lieutenant-general and senator and soon after minister of war. After the marriage of Queen Isabella in 1846 Serrano obtained such influence with her that trouble arose in the royal household. The ministry which supported him was overthrown by public indignation. Serrano soon after became a Liberal and in his endeavors to thwart Narvaez, procured the recall of Espartero and Olozaga. He was obliged, however, to accept the captaincy-general of Granada, which withdrew him from the court. In February, 1854, he was implicated in an insurrection at Saragossa and was banished. He returned however in July and supported the O'Donnell-Espartero ministry, until there was a rupture between its leaders. He then took sides with O'Donnell and was made captain-general of New Castile, which put Madrid in his power. He supported O'Donnell in his *coup d'état* of July, 1856, and quelled more than one insurrection. In the next year he was made ambassador to Paris, but the fall of O'Donnell in September occasioned his recall. In 1859 he was made captain-general of Cuba, and his attempts to procure the restoration of Santo Domingo to Spain, though finally abortive, served to obtain for him the title of Duke de la Torre and the rank of grandee of the first class. In the Senate he steadily opposed Narvaez, and in June, 1865, when that minister was temporarily driven from power, Serrano became captain-general of Madrid. But Narvaez returned in 1866 and soon prorogued the Cortes. Serrano, as president of the Senate, presented to the queen a protest against this act as illegal, but was prosecuted therefor by the ministry and for a time imprisoned. When the revolution of September, 1868, drove the queen from the country Serrano hastened to Cadiz and with Gen. Prim seized the direction of the government. He became president of the council of ministers and commander-in-chief of the army. While the modern ideas of human rights and freedom were proclaimed and introduced into the laws, the Cortes decided in favor of a constitutional monarchy in June, 1869. But it was not easy to get a king to take the uncertain position, and on the 16th Serrano was declared regent by a vote of 193 against 45. The Republicans had earnestly resisted the return to monarchy and now rose in insurrection in various places, but the marshal readily overcame them and on Oct. 17th, Valencia, their last stronghold, surrendered. Cuba took advantage of the troubles of Spain to declare its independence, and it was even rumored that the marshal was negotiating the cession of that island to the United States as the shortest way out of the difficulty. But on the contrary the American government by preventing the infringement of neutrality gave the Spanish government time to recover its hold on its most precious possession "the ever faithful isle." A Carlist conspiracy at Barcelona caused alarm, but was overcome. Meantime the offer of the Spanish throne to a Hohenzollern prince was made a pretext for the declaration of war by France against Prussia, with its disastrous results to the aggressor. Finally Prince Amadeus, son of the King of Italy, was elected King of Spain Nov. 16, 1870, and was prevailed upon to accept the throne. During his troublesome reign of fourteen months, Serrano was the most prominent figure, exerting himself in every way to preserve order among the restive partisans, Carlists and Republicans. The latter suc-

ceeded so far that Amadeus abdicated the royal power and the republic was proclaimed Feb. 11, 1873. Serrano, who had remained quiet meanwhile, was on Feb. 27, 1874, appointed president of the executive power and took the field against the Carlists of the north. In May he returned triumphant and received a splendid ovation. In December, however, he again marched against the Carlists, but learning that Alfonso, the son of Queen Isabella, was to be proclaimed King, and believing that this course would restore peace to Spain, he withdrew for a short time to France. On Feb. 1, 1875, he returned to Madrid and soon became a member of the new Spanish Senate. He objected to the terms of the Constitution of 1876, but sought their amendment by legislative methods. In 1882 he proposed the formation of a new party to be called the Dynastic Left. His opposition however gradually subsided and in November, 1883, he was appointed ambassador to France. He died at Paris Nov. 26, 1885. (J. P. L.)

SEVIER, JOHN (1744-1815), first governor of Tennessee, was born in the Shenandoah Valley, Virginia, in 1744. He was of French Huguenot parentage and was early noted for his agility and daring. In 1769 he joined the party which built a fort on Watauga River, supposing it to be in Virginia territory. In 1773 he was commissioned by Lord Dunmore, governor of Virginia, as captain and took part in an expedition against the Shawnee Indians. In the next year he fought at Point Pleasant on the Ohio. In 1777 he was chosen as delegate from the Watauga settlement to the North Carolina legislature and obtained a district organization and local courts for the territory west of the mountains. His activity in holding in check the Indians whose war-path had been obstructed by the new settlements, endeared him to the whites. Commissioned as lieutenant-colonel in 1779 he punished the Indians severely at Boyd's Creek. Still more important was his leading his hardy followers over the mountains and gaining a signal victory over the well-disciplined loyalists at King's Mountain, Oct. 7, 1780. This stemmed the British progress northward and revived the patriot cause in North Carolina. The legislature therefore acknowledged his bravery by a vote of thanks and a sword. In 1784 however North Carolina made a conditional cession of her territory beyond the mountains to the General Government, and the settlers finding their interests neglected, assembled in convention at Jonesborough, organized a separate State to be called Franklin, and chose Sevier its governor. The North Carolina authorities, roused by this action, retracted their own proposal. They renewed their claims to the territory, and supported some disaffected settlers in their opposition to Sevier and his government. His representatives appealed to Congress at Philadelphia, but they met with little favor. When Sevier's term of three years expired, no election was held for a successor, and the inchoate State lapsed into its original condition. Sevier was still the leading man of the region and was commissioned by Washington in 1790 as brigadier-general of the "Territory South of the Ohio River," which had been formed from the lands relinquished by Virginia and the Carolinas. The part ceded by North Carolina was in 1796 erected into the State of Tennessee, and Sevier was elected its governor. He served for two terms, then retired, but in 1803 was again chosen and served six years more. In

1811 he was elected to Congress and he served on the committee on military affairs during the war of 1812. In 1815 he accepted a commission to negotiate with the Creek Indians and while engaged in this business died near Fort Decatur, Ala., Sept. 24, 1815. His memory is honored by a monument at Nashville. See Ramsay's *History of Tennessee* and J. R. Gilmore's *John Sevier, the Commonwealth-BUILDER* (1885).

SEWALL, SAMUEL (1652-1730), Puritan, chief-justice of Massachusetts, was born at Bishopstoke, England, March 28, 1652. He was brought by his father to Newbury, Mass., in 1659, and was educated at Harvard, graduating in 1671. He remained there as librarian, and studied theology, but his marriage in 1676 with the daughter of the minister, John Hull, diverted him from preaching to become assistant in his father-in-law's business. In 1684 he was made assistant-governor and as such in 1686 he surrendered the colonial charter to Sir Edmund Andros. During his visit to England in 1688-9 the people overthrew Andros' government. Sewall in 1692 was made a judge and also a member of the executive council. In that year he presided at the trial of some of the victims of the Salem witchcraft delusion. A few years later, convinced of his error, he made a public confession in the church, asking pardon of God and men for his offence. His conscience was also touched by the sin of slave dealing, and he published a tract, *The Selling of Joseph* (1700). He was also an advocate and supporter of Indian missions. In 1718 he was promoted to be chief-justice of the colony and held that office ten years. He died at Boston, Jan. 1, 1730. He had published *Answers to Quæries respecting America* (1690); *Accomplishment of Prophecies* (1713); *Description of the New Haven* (1727). For full understanding of his life and times see his *Diary*, edited by Joseph Sewall and published by the Massachusetts Historical Society (1878).

His son, **JOSEPH SEWALL** (1688-1769), was a fervid orthodox preacher, known as "The Weeping Prophet." He graduated at Harvard College in 1707, and in 1724 was called to be its president, but declined. He had been assistant pastor of Old South Church since 1713, and was a member of the Society for propagating the Gospel in New England. He gave his approval to Whitefield in 1740 and contributed to the support of students at Harvard. He died at Boston, June 27, 1769.

Samuel's nephew, **STEPHEN SEWALL** (1704-1760), also became chief-justice in 1752, after having been judge of the Superior Court since 1739.

Stephen's nephew, **JONATHAN MITCHELL SEWALL** (1745-1808), though a prominent lawyer, was more famous as the writer of patriotic and political songs. During the Revolution his "War and Washington" had great vogue. In his "Epilogue" to Addison's *Cato*, written in 1778, occurs the once famous couplet:—

"No pent-up Utica contracts your powers,
But the whole boundless continent is yours."

A collected edition of his *Poems* was published in 1801 at Portsmouth, N. H., where he died March 29, 1808.

Stephen's grandnephew, **JONATHAN SEWALL** (1728-1796), was a loyalist, and died judge of the admiralty in New Brunswick.

SAMUEL SEWALL (1757-1814), great-grandson of the first-mentioned, attained to the same high judicial position. He graduated at Harvard in 1776, and having engaged in the practice of law at Marblehead, was frequently elected to the State legislature, and in 1797 to Congress. In 1800 he was made judge of the Superior Court and in 1813 chief-justice. He died June 8, 1814, at Wiscasset, Maine, where he had gone to hold court.

SEWERAGE. Until within recent years American sewerage systems have been modelled after European examples and based upon the experience of other countries, using very much the same material and employing the same methods of workmanship. Later experience, however, has shown the need of new methods to meet the special conditions peculiar to certain localities, as, for example, at Chicago, Memphis, and Boston, or in summer sea-side settlements. It has also been found that the data regarding rainfall and population derived from European experience did not apply equally to this country, where the climatic conditions are entirely different, as well as the habits of our people in respect to the more general use of plumbing appliances, fondness for bathing, and the enormous consumption of water for manufacturing purposes.

The rainfall of London averages 24 inches per annum, only one-half as much as that of Boston, while the consumption of water per head in London is but one-third as much as in Boston. Again, the rainfall in America is much heavier than in England, sometimes amounting to nine inches in a single month or two inches in twenty-four hours, in contrast to the "perpetual drizzle" of Great Britain. In Pullman, Ill., the average discharge into sewers from each dwelling amounts to 100 gallons per day. In New York City the total water-consumption per head is nearly as large.

There are still many towns without any sewerage systems, though they have a public water-supply; while, owing to their rapid growth, many other cities have found their sewers wholly inadequate. The population is frequently scattered over large areas, so that the section to be drained is so great that the cost of laying sewers becomes enormous. Again, in most large cities a considerable population of ignorant foreigners who live in tenement-houses are not accustomed to modern sanitary conveniences, and, being careless and filthy in their habits, they throw all sorts of rubbish into drains and sewers, and consequently make the cost of maintenance excessive.

Recent Changes.—The most notable recent developments in American engineering practice have been: (1) In the substitution of much smaller sewers than were formerly used, and having them constructed of such a shape and material, either brick or tile, carefully laid with proper grade and alignment, as to prevent any deposits and to secure a uniform and constant flow of the waste material. (2) In the employment of flush-tanks, where sewers are laid with but slight grade, so placed at their upper ends that they will be thoroughly scoured and kept free from all deposits. The authorities of Paris have lately advised the expenditure of \$520,000 to supply no less than 3166 flush-tanks, to discharge once or twice every twenty-four hours. They have been used with great benefit in many other places, notably in Memphis, Tenn., under the direction of Col. G. E. Waring. (3) In the systematic ventilation of sewers by perforated man-holes, located at the street level, and always kept open. (4) In the use of improved appliances for clearing catch-basins and removing deposits of silt or other material when necessary; and (5) In superintending and regulating plumbers and other mechanics when making connections from buildings with the sewers as a security against careless workmanship.

Formerly sewers were often built of sufficient area to contain a hay-cart or a row-boat; now the preference is given to much smaller conduits, and the cost of construction has been thereby much reduced. According to Prof. Parkes, the total amount of excreta from a mixed population would not exceed twenty-five tons of solid and 91,250 gallons of fluid matter for each 1000 inhabitants, every twenty-four

hours, and as this is delivered into the sewer through the entire day, it can be carried off through a very small drain. In Paris the sewage from a barrack building containing 1000 soldiers was readily conveyed through a four-inch drain. Experiments at Saratoga demonstrated that the entire waste products from a hotel with over 2000 occupants did not fill a six-inch pipe. It is therefore entirely unnecessary and merely a great source of expense to build colossal sewers like the Cloaca Maxima in Rome, and which were formerly deemed indispensable; but sewers are now proportioned to the actual needs of a given locality.

In European practice it is usual to connect house-drains directly with sewers and to allow the former to ventilate through the latter. Where sewers are properly constructed, well laid, and properly ventilated and flushed, there is no objection to this practice. American sewers, however, are so frequently defective from bad construction, breakage, or the accumulation of deposits that it is deemed wise to place an intercepting trap between each house and the sewer with an air-inlet opening at the ground level, and this rule is now generally enforced by all boards of health.

The recent introduction of public steam-heating apparatus in many American cities, and the discomfort and damage caused by constantly turning up street pavements to repair steam pipes, together with the necessity of laying telegraph and telephone wires underground, is steadily preparing the way for the adoption of the Parisian system of laying all sewer, gas, and water mains in an underground tunnel or conduit, where they will be easily accessible without disturbing street pavements, and this improvement will undoubtedly be brought about before long in many cities.

There has been considerable discussion of late in this country as to whether it is best to construct small sewers to receive house-drainage alone, and to make separate provision for rain-water, instead of building sewers of sufficient capacity to receive both forms of waste material. The former method has advantages on the score of economy, and is adapted for localities where there is sufficient grade to the streets to carry off the surface water promptly and where a suitable and safe outfall can be secured. It is charged that large sewers are more apt to be foul from the difficulty of flushing them, that they create more gases, and that they are more expensive both to construct and to maintain. The opponents of the so-called "separate system" claim that surface water will usually be so contaminated as to be unfit for discharging into an ordinary river or stream, and therefore it must be treated as house-waste and removed to a distance. The cost of the two systems of drains, it is claimed, will be greater than one set of pipes, while the rain-water is essential to flush and clean the sewers. Col. Geo. E. Waring has been the principal advocate of the separate system, but conservative engineers like Sir Robert Rawlinson take an opposite view. The general verdict seems to be that no system is applicable to all conditions, and that local considerations must have chief weight in deciding what form of sewerage is to be adopted.

The unsatisfactory results which have followed in London and Paris from discharging the sewage of these great cities into the Thames and Seine rivers have led to the consideration of some other method of sewage disposal, and the irrigation system has been widely advocated instead. Elaborate experiments have been made at Berlin, Edinburgh, and near Paris for disposing of sewage by irrigation. No nuisance has been created and, notwithstanding the popular apprehension, the health of the neighborhood has not been injured, while very extensive crops have been grown on the sewage farms, and have helped to

reduce the expense of their maintenance. Similar experiments have been tried in many English towns with very satisfactory results. The general conclusion, however, has been reached that none of these enterprises can be made profitable and that they must always be viewed as sanitary rather than economical undertakings.

In Great Britain more than 150 towns have introduced the system of sewage disposal by sub-surface irrigation, and the same system has been successfully introduced in the United States though not on a large scale as yet. At Pullman, Ill., with a population of 9,000, most of the sewage is disposed of upon a farm of 140 acres, and the same system has been applied at Lenox, where there is only a small permanent population, and at a number of public and other institutions, as at Lawrenceville, Princeton, and Morristown, N. J., at Sherborn, Danvers, and Worcester, Mass., and at Bryn Mawr, Pa. It has also been utilized at Orange, N. J., and in other places, to drain detached villa residences, and under most conditions has given satisfactory results. It is now proposed to adopt the irrigation system on a larger scale at East Orange, N. J., Brockton, Mass., Los Angeles, Cal., and at Providence, R. I. The latter undertaking will cost in the neighborhood of \$3,700,000, and the result of the experiment will be awaited with interest.

The *Sanitary Engineer* sums up the advantages and disadvantages of the irrigation system as follows: "It would seem that the application of sewage to land, under proper precautions, is the least dangerous and most useful way of disposing of it; that precipitation processes are in some cases useful and even necessary preliminaries to the land filtration; that the disposal of sewage can rarely, if ever, be effected without expense; and, especially, that each case is a problem of itself, to be worked out by a skilled and experienced engineer."

Where a number of towns are situated along a river and discharge their sewage into the stream which is also used as a source of water-supply, as in the case of the Hudson and Passaic rivers, there is great risk of pollution of the drinking supply. A commission appointed by the State of Massachusetts in 1885 has recently presented a plan for draining the valleys of the Mystic, Blackstone, and Charles rivers, and at the same time protect the water-supply of Boston and adjacent towns and cities. The scheme of a united system of drainage for several neighboring towns is considered here for the first time in this country, and it is therefore of special interest. Wherever practicable the sewage is to be carried by intercepting sewers to Boston and discharge into the main drainage system of the latter. For towns too remote from Boston and too far apart to warrant any combination for a sewage disposal, separate areas for intermittent filtration are recommended.

Among the sewerage works constructed of late years in American cities are the following: At Memphis 40 miles of sewers planned by Col. Geo. E. Waring are now in operation at a total cost of \$275,000. Pittsburgh, Pa., is said to have over 100 miles of new sewers. At Charleston, S. C., \$230,000 is to be spent on 43 miles of sewerage. At East Orange, N. J., a nearly equal amount is to be expended. Omaha, Neb., has expended \$98,493 on sewers. New York City has increased her sewers within a very few years from 360 to 414 miles. Boston has 200 miles of sewers, just double the area of 1869, and has spent \$2,000,000 upon a great intercepting sewer, which is a model of engineering. The city of Providence, R. I., is considering the expenditure of a large sum for drainage works, upon plans proposed by City Engineer Gray. The Chicago drainage and water-supply commission reports that an

outlay of more than \$30,000,000 will be required, and an annual expenditure of \$2,000,000, to meet the needs of its growing population. Newark, N. J., has spent \$550,000 on a new system of sewers. Albany, Trenton, Newport, New London, Norfolk (Va.), and Baltimore, are all contemplating taking similar action or have actually begun the work. Bar Harbor, Coney Island, Nahant, Atlantic City, Cape May, Asbury Park, and other summer resorts have wisely made provision for drainage and water-supply.

Domestic Sewerage.—Within a few years, and chiefly since 1879, an entire revolution has taken place in the methods of domestic sewerage, and the greatest advance in this direction has been made in the United States. This has been due to the wide discussion of sanitary questions in the press and in official reports, at sanitary conventions and public health associations, and on the lecture platform, together with the interest created by repeated outbreaks of disease traceable to bad drainage, which have sometimes assumed epidemic proportions. It has been accompanied by the passage of laws, in many States, regulating the manner in which plumbing should be executed in new buildings in all large cities and towns, and also requiring that plumbers shall be licensed after passing an examination as to their qualifications. These regulations were first adopted by the cities of New York and Brooklyn, but they have since been widely copied in other places, and as a result great improvements have been effected. A plan of the drainage in all new buildings must now be submitted to the local board of health, and be approved before the work can go on, while the work itself must be subject to inspection during its progress and after completion. As a result, there has been a notable advance both in the quality of the plumbing recently executed and in the intelligence and skill of architects, builders, and plumbers alike.

Hitherto most of the plumbing, especially in buildings in large cities, has been performed under contract for speculative builders and in a reckless manner; such parts of the work as are visible may be properly done, but the hidden and most important portions are usually scamped, so that sickness and death frequently result from the escape of sewer-gas into the dwellings.

Among the most common defects to be found in ordinary dwellings, even of the better class, are the following: Brick or earthenware drains laid underground with imperfect joints, so as to leak into the soil and create foul odors which are liable to rise into living rooms.

Soil pipes constructed of lead instead of iron, so that they sag or are eaten by rats or corroded by sewer-gas at bends or angles; or on the upper side of pipes when laid horizontally, so that foul air may escape without there being any leakage to indicate a defect.

Soil pipes of iron, but with defective joints or lacking in ventilation to the outer air. These pipes are often used as rain-water leaders, and when gorged with rain they cannot serve as ventilators, and foul air is forced into living rooms. Again, they may be connected with chimney flues with a view to securing an upward draught to assist ventilation. In such cases there is danger of sewer-gases penetrating through the cracks in the chimney into living rooms or of a down-draught when the chimney is cold.

Soil pipes connecting with unventilated cesspools or sewers, without any barrier to prevent back pressure.

Insufficient or improper traps, which either become so foul as to be miniature cesspools or lose their seals by siphonage or evaporation.

Refrigerators connected with drains, so that the food-supply is poisoned by foul gases.

Water-tanks with their overflows leading into the cesspools or sewer so as to pollute the drinking supply.

Uncleanly water-closets and other fixtures with deficient water for flushing purposes, and with improper drip-trays, safe wastes, and other connections.

When to these inherent defects, due to ignorance, cupidity, or carelessness, are added the effects of neglect on the part of householders and domestics, the wear and tear of time, and of occasional patching where pipes have become choked or damaged, or where certain portions are abandoned or cut off, a state of things will be found which is far from sanitary or safe. Yet such is the condition of hundreds of houses occupied by the most intelligent and prosperous people. When such buildings, where people may have lived for years without suspicion that anything was wrong, are tested with peppermint, or in other ways, great surprise is manifested at their condition, but the heavy mortality from preventable disease in all settled communities affords ample evidence of the dire effects of so much bad plumbing.

Under the rules and regulations now enforced by boards of health the following features are insisted upon in all the plumbing of new dwellings:

1. The materials must all be of the best; extra-heavy cast-iron pipe, tarred inside and out, and lead pipe and sheet lead of proportionate weight and thickness.
2. All pipes and drains must be concentrated as far as possible, so as to be easily accessible for examination, and so far as possible open to view, the drain pipe in the cellar being carried along the side wall wherever possible and not underground.
3. All joints must be carefully calked with lead, and it is now becoming customary to test them by water-pressure, or with an air-pump, to insure that there are no flaws or leaks.
4. In each house the drains must be disconnected from the sewer or cesspool by a running trap with an opening for foot ventilation carried to the ground level or the edge of the sidewalk so as to create an upward current through the soil pipe, which must be carried up through the roof of full size and usually with the upper end enlarged and left wide open without any cowls, caps, or return bends, but simply protected by a wire basket strainer.

No soil pipe should be used as a leader or connected with a chimney.

Each and every fixture must be separately trapped by an S- or P-trap placed as close to the fixture as possible and ventilated as a security against siphonage by a back-air pipe of ample size connecting at the crown of the trap. All water-closets must be flushed by a separate cistern, and not connected with the same pipes which supply the inmates with drinking-water, nor must any tank overflow or any refrigerator connect directly with a drain. Where the water does not rise at all times to the upper fixtures in a house, then a tank must be provided with a pump to keep it filled.

The English practice of using lead soil pipe has been entirely abandoned in the United States, while the custom of carrying soil pipes outside the building and of separating the drainage from baths and basins from that of water-closets and conveying it in a distinct waste pipe has not been deemed necessary here.

The regulations enforced by boards of health do not affect the choice of fixtures in houses. Great improvement, however, has been made in this direction. With the remarkable advance in the design, decoration, and furnishing of modern dwellings, due to the recent rapid growth in æsthetic taste, there has been a proportionate improvement in the line of

plumbing fixtures. Lavatories and bathrooms are now constructed in the most costly and luxurious manner, the floors and walls being covered with tiling, heavy porcelain-lined baths exposed without superfluous wood-work, and the water-closets and basins fitted up in a most elaborate manner with brass pipes, marble flooring, nickel-plated traps, and other fittings of the most elaborate description. The kitchens and laundries in many private and public buildings are no less expensively furnished, with porcelain sinks and wash-tubs and with the walls and floors protected from moisture by marble or tiling, so that it may be said that modern plumbing has become an æsthetic art as well as a science.

(C. F. W.)

In this connection it may be stated that two new styles of water-closets (both American inventions) have recently been introduced—the "Wash-out" and the "Tip sanitary closet." The former consists in a receiving bowl connected by an S-trap with the soil pipe without valves or moving mechanical parts of any kind. Water is supplied from a tank placed high above the closet, which, coming down with a rush, carries everything before it through the trap and into the soil pipe. Being made of one piece and devoid of all forms of pan, valve, plunger, and siphon attachments it cannot get out of order and is an improvement on former inventions; it requires a large amount of water, which is probably no great objection when the city supply is abundant. The "Tip sanitary closet" is a new departure, or an old one revived. It consists in a receiving bowl and reservoir balanced on trunnions over a hopper; both bowl and reservoir are automatically filled with water from a storage reservoir over the closet and are in one piece, separated by a low water-fence or dam. The receiving bowl is narrowed in front and opens, spout-shaped, into a detached hopper and trap through which its contents are discharged into the soil pipe whenever the closet is "tipped," which can be done by pressing on a stirrup beneath the foot. The water at the back of the receiving bowl, which is regulated by a ball-cock, follows the previous contents of the bowl when tipped and cleanses it of any remaining impurities. The claims made for this closet are saving of water, noiseless action, and simplicity of construction, the only mechanism being the ball-cock and trunnions for tipping.

The ultimate disposal of sewage, including street sweepings, ashes, garbage, and kitchen waste, is now receiving the earnest consideration of sanitarians, and although no plan has yet been perfected, scientific experiments are being made throughout Europe and the United States with a view to destroying by fire, or its equivalent, all refuse of cities. In 1870 Paddington, England, first experimented with a "garbage destructor," which proved a complete failure; a few years later Manchester attempted a similar enterprise, with little better success, though in later years it has accomplished much in this direction. Birmingham, in 1877, met with like reverses at first. Bradford was more fortunate with the "Healey Patent Destructor;" but the one most successful, now in use in England, is the "Beehive Destructor," which was first introduced in Richmond, England, and is now extensively used in that country. In the United States, the first "crematory" for the destruction of garbage was constructed at Governor's Island, New York Harbor, in 1885, for the purpose of disposing of the waste material of the post. Allegheny City, Pa., followed, the same year, with a small "destructor." Two years later a small furnace was built for the use of Johns Hopkins University, Baltimore, Md. Probably the first extensive "destructors" were the "Engle patent," put up at Des Moines, Iowa, and the "Forrietal furnace," erected at Milwaukee, Wis., in 1886. The "Rider garbage furnace" followed, the next year, at Pittsburg, Pa., and the "William Mann patent" was erected at Chicago about the same time. In 1888 Minneapolis, Minn., adopted the "Engle patent," with improvements, and was followed by Milwaukee, Wis., and Coney Island, N. Y.

Dr. S. S. Kilvington, president of the board of health of Minneapolis, in speaking of the four principal crematories which have been in use during the

past three years in the United States, says: "The Forristal furnace, which has been operated until recently in the city of Milwaukee, consists of a two-story building. Teams drive into this building and dump their loads into a hopper, from whence it is carried by elevators into the drying-room above. Here it is treated by steam-heat, and the liquid residue is drained off. It is then shovelled through a tubular shoot to the floor below, where it is deposited in front of the furnace doors. Thence it is shovelled into the fire, and kept constantly stirred. The fire itself is operated on the principle of a blacksmith's forge, with the aid of a blast fan. The latter, together with the refuse-elevators, is run by a small steam-engine, which also furnishes steam for the drying-room. The furnace is of brick, with square form and arched top. It contains a single fire, which is relighted every day. A single row of doors on each side of the furnace serves for the admission of fuel, for the supply of refuse, and for stirring or stoking the fire. Smoke and gases are carried out directly into the chimney shaft. An engineer and four laborers are required to run the plant."

The "Rider garbage furnace" has been largely used in Pittsburg for the destruction of spent tan-bark and has performed this task, as also that of the destruction of garbage, to the apparent satisfaction of its owners and the public. Its construction requires the primary investment of a large sum, but its patentee claims for it great economy in the expenditure of fuel, of which it is said to require an amount equal to less than five per cent. of the material cremated, this being used as an initial supply to bring all parts of the furnace to a proper temperature; after which it is claimed that the garbage itself, if furnished in sufficient quantity, will provide all the fuel necessary to maintain its operations. This furnace consists of a front chamber 12½ by 6½ feet, which is surmounted by a dome containing 8 circular openings, 15 inches in diameter. In the rear of this is another chamber, 9½ by 6½ feet, floored with a tile hearth and separated from the first chamber by a bridge wall, 3 feet in thickness, and having in its rear a second bridge wall over which the products of combustion pass to enter the chimney. The second chamber is also surmounted by a dome in which are 6 circular openings, of the same size as the first. The products of complete combustion are said to be innocuous, while the solid residue is valuable as a fertilizer.

The "Mann destructor" shares with the Engle patent the beauty of simplicity of structure. As built in Montreal, Canada, where its operations are reported as being very satisfactory, its combustion chamber is quadrilateral, with dimensions 16 by 9 feet, and 10 feet high. This is fitted with a grate of approximately same dimensions, laid with a slight incline upward in the direction of the chimney-flue. At the lower end of this grate is its single fireplace. On each side are three tiers of three doors each; the upper tiers are at the level of a staging floor upon which the loaded refuse-carts are driven, the refuse being emptied directly into the furnace through these doors, or placed upon the floor in front of them. The second tier of openings is situated just above the line of the grate, and these are used for stirring the fire. The lowest tier is at the level of the ash-pit and are for the removal of the ashes. The grate bars are two inches apart.

The "Engle crematory" has a brick chamber 33 feet long by 5 feet wide, and 7 feet high from grate to dome; at the end of the furnace grate nearest the chimney, but not opening into it, is the primary fireplace; at the further end of the furnace grate, and communicating with it, is a second grate four feet below the level of the primary one. Here a sec-

ondary fire burns, and with it the chimney flues are connected by a superheated tiled roof conduit, running beneath the primary fire-grate for a length of 28 feet to the chimney shaft, 100 feet high. The building in which the furnace is enclosed is three stories in height; at the level of the first floor is a double row of doors, the upper of which is used for feeding the primary fire and for stoking the burning material, while the lower opens into the ash-pit and permits the removal of ashes. On the same floor, at the farther end of the furnace, are doors for supplying the secondary fire and removing its ashes. The second floor is on a level with the top of the brick furnace, and upon this floor the bodies of dead animals are delivered through a large tubular shaft, by means of pulley attachments, to the furnace below near the primary fire. The third floor is on a level with three tubular shafts, 15 feet in length, rising from the dome of the furnace and into which the miscellaneous refuse-wagons immediately discharge their contents from the upper floor upon which they drive. The capacity of this furnace is very great, and the expense of operating is said to be very moderate. Three men operating it five days, consuming 33 horses, 59 dogs, 103 barrels of hotel and commission house refuse, 12 loads of market offal, and 70 loads of manure, weighing in all over 200 tons, at a cost for labor and fuel of \$38 25, or 19 cents per ton. An analysis of the ash from this crematory demonstrated that it was valuable as a fertilizer.

The most recent and novel invention has lately been erected in Buffalo, N. Y., and is called a "garbage extractor." It is thus described by Dr. Edward Clark, health officer of that city, who says it is a wonderful piece of mechanism: "The garbage is first of all put into dryers, which consist of a large iron cylinder within a cylinder; the space between the two cylinders is filled with superheated steam, which drives over 60 per cent. by weight in the shape of moisture and organic gases from the garbage. The internal cylinder contains a number of revolving arms, filled also with superheated steam; these arms keep the garbage constantly stirred, so that all moisture is driven off at a temperature of over 300° F., and by means of a powerful suction fan is forced into a column condenser from which it emerges as a perfectly clear and odorless water. After the moisture is all driven off, in the form of a distillate, the dryers are emptied of their contents, and instead of resembling garbage the mass looks like soft brown earth containing a certain quantity of grease. It has very little odor. This mass is then elevated into what is known as the 'extractor,' where, by means of a chemical solution, all the grease is extracted and drawn off into barrels. This, of course, has a commercial value. The residue is then taken from the extractor and used as a fertilizer, after removing all the pieces of bones, glass, iron, rags, etc. The final product is perfectly dry, free from oil and odor, and no more offensive than dry earth, which it very closely resembles."

It would seem, from the description of the various kinds of "cremators," "destructors," and the "extractor," that the disposal of all manner of sewage is in process of being solved without the use of drain and sewer-pipes. House and hotel crematories are also coming into use quite extensively in the larger cities, and some families even depend upon their kitchen range to destroy the greater portion of the garbage and kitchen refuse, rather than rely upon the uncertain movements of the garbage collector, while the dry earth or ashes and the pail-closet system of disposing of excrement emphasizes the practicability of dispensing with the dangerous water-closet and sewer-pipe.

Dry-air Closets.—Another system of disposing of fecal and urinary deposits is rapidly coming into

favor. This is known as the "Smead system of dry-air closets." It consists in passing the dry air of a properly ventilated house through the closets and into a ventilating shaft. The manner of doing this is unique and the result is remarkable: A "down-draught" from the various rooms in the building, created by flues connecting with a heated ventilating shaft outside, carries the vitiated air of the ventilated rooms into a "gathering room" which communicates directly with the closets and thence with the shaft—the fecal and urinary deposits are thus subjected to a constant current of dry air, which not only destroys all odor and evaporates all moisture but renders the night-soil so dry and earth-like as to no longer resemble fecal discharges; it can then be burned where it lies or used as a fertilizer. Many school-houses throughout the United States are supplied with this system of "sewerage," thus dispensing entirely with water-closets, the tests having proved satisfactory both in winter and summer.

(P. H. B.)

SEWING-MACHINES.

Of modern inventions there are few of more importance, or that have done more for the comfort and convenience of civilized communities than the sewing-machine. In its various applications to the making of clothing, shoes, etc., it has greatly added to the abundance and cheapness of these necessities of life, and aided in enabling the poorest of the laboring classes to dress warmly and respectably. The sewing-machine is usually claimed as an American invention, and justly so, if regarded as an effective instrument, though the idea originated in England, where efforts at machine-sewing were made as early as the middle of the last century. No satisfactory English machine was produced, however, though that of Thomas Saint (1790) possessed many of the features of the successful modern machines. A French inventor, M. Thimonnier, produced in 1830 a machine which worked with some efficiency, and was patented, in an improved form, in the United States in 1850. America, however, has the honor of producing the first practicable machines for sewing cloth and leather. The Rev. John Adams Dodge, of Monkton, Vt., invented, in 1818, a machine which, like the earliest English machine, used a double-pointed needle with the eye in the middle. It made a back stitch, and sewed a good seam straight forward, but would not let the cloth be turned. This machine was not patented, and the professional duties of the inventor forced him soon to abandon his experiments.

The earliest effective machine of the modern pattern was invented in 1832 by Walter Hunt, of New York. It was the first machine to use two threads, one being carried by a curved needle, with the eye in the point, the other by a shuttle. It formed what is known as the lock stitch. Other inventors followed, from time to time, and in 1846 Elias Howe, of Cambridge, Mass., took out a patent for a machine which was in its more important appliances similar to the unpatented Hunt machine, though with several novel devices. This is looked upon as the parent sewing-machine, all the more recent inventions being, in the main, simply improvements upon it. It had defects which the inventor did not succeed in overcoming, and which prevented it from working satisfactorily and being accepted by the public or by capitalists. These defects were removed by later and better mechanics. John Bradshaw, of Lowell, Mass., patented in 1848 a device to regulate the tension. Others improved the feeding arrangement, and still others invented a lock stitch differing from Howe's, though the same in principle. The lack of a satisfactory feeding device, a defect in all the earlier machines, was overcome in 1850 by the effective four-motioned feeder invented by Allen B.

Wilson, of Pittsfield, Mass. His machine also replaced the shuttle by a rotating hook device. Other machines quickly followed. That of Isaac M. Singer, the first that proved satisfactory to manufacturers, is said to have been produced in 12 days' time on a promise to make an efficiently working machine for \$40. In 1851 William O. Grover, of Boston, invented a machine that made a double loop stitch by means of a circular rotating needle. All these machines used the leading features patented by Howe several years before, and a lawsuit arose which ended in his being paid a royalty on all machines manufactured. This royalty continued in force till 1867, and brought him in nearly \$2,000,000. Singer, by obtaining control of other patents, accumulated a large fortune.

The Weed, the Florence, and other new machines came into the market about 1854, the Willcox & Gibbs in 1857, and since that period the application for patents for sewing-machines and devices connected therewith have averaged about 50 per year. The last mentioned, invented by James E. A. Gibbs, of Millpoint, Va., is the most popular of the single-thread machines. It makes a twisted loop stitch by means of a rotating hook under the cloth, and, having the advantages of noiselessness, speed, and ease of running, has sold largely. Of the more recent machines we may name the Remington, Domestic, American, and two Howe machines (the Elias and the Amasa B. Howe). An important event occurred on the 8th of May, 1877. At noon of that day the last of the essential patents held by the sewing-machine manufacturers expired, and the devices necessary to the making of a workable machine were open to all. Prices at once fell 40 or 50 per cent., the \$60 machine being reduced to \$30, and the \$70 to \$40. This was a highly desirable result to the general public, and has greatly added to the number of machines in domestic use. The Wilson feeder was the most important of the expiring inventions, others being the vibrating needle, the reciprocating shuttle, and the rotating hook. There are perhaps a thousand patents still in force, but the above-named were the foundation patents, without which no first-class machine could be made. In addition to the patents for machines, many have been taken out for devices necessary to perform certain kinds of sewing, such as basting, folding the cloth for hemming, button-hole making, etc. Some of these devices are remarkable for the intricacy and accuracy of their achievements, and machine work is now done of a character that would seem impossible to be performed otherwise than by hand. By the use of the sewing-machine, sewing can be done with at least five times the rapidity of the fastest hand-sewing, and with greatly decreased labor. The treadle motion, which has hitherto been the most exhausting part of the work, is being avoided by the use of steam, and by spring and electric motors suitable for house use, which, when generally introduced, will be a great saving of labor. It is questionable if much further improvement can be made in the efficiency of the sewing-machine; it is almost perfect in its running and its performance now, and is a notable example of the great advance in modern machinery.

In addition to the machines in use for ordinary sewing, there are many inventions adapted to the performance of special work which in some cases is seemingly beyond the power of machinery, yet is done with extraordinary accuracy and rapidity. A very important one of these is the cylinder sewing-machine, which possesses a cylindrical feed arrangement adapted to sew seams on sleeves, water-hose, leather buckets, boot-legs, and similar cylindrical articles. It is adapted for all grades of shoe-work, but especially for vamping, and is also used largely by manufacturers of gloves, pocket-books, travelling

bags, and many other articles of this general character. Other machines adapted to special work are the carpet sewing, the book sewing, the shoe sewing, the sail making, etc. The most useful among these are the shoe-sewing machines, their importance being almost equal to that of the ordinary cloth-sewing machines. By their aid

Cylinder Sewing-machine.

and the special button-hole stitch. The lock-stitch is made by all shuttle machines and by those employing a rotating or revolving hook. Of all stitch-making devices the shuttle is now most extensively used, though it is replaced in some machines by other devices yielding the same general result. In

Bobbins and Bobbin-attachments.

many millions of boots and shoes are annually produced, with a cheapness and rapidity unapproachable by hand-work. Of the various machines used in this industry the McKay, invented about 1858, is that principally employed. For statistics of the factory work produced by the aid of these machines, see article, SHOES.

Another instrument of remarkable character is the automatic button-hole machine, of which we give an illustration. There is no department of sewing-machine work in which greater progress has been made. A few years ago it was considered an excellent performance to make 1000 button-holes in a day of ten hours by machine labor, yet to-day from 3000 to 6000 holes per day can be made—the number varying with the fineness of the stitch and length of the button-hole—and with less fatigue to the operator than in the old process. The machine here illustrated is an instrument of almost magical efficiency. It can be run to make from 1000 to 1200 stitches per minute; it will make a straight button-hole of any length up to one inch; it cuts the hole in the material, winds its own bobbins, stitches or cords the hole as desired, and stops automatically, without aid from the operator, when the stitching is completed. It seems almost possessed of conscious intelligence.

Button-hole Machine.

Various stitches have from time to time been used in sewing-machine work, but at present the lock-stitch is employed in fully four-fifths of all machines made. Of other stitches now employed may be named the Grover & Baker double loop, the Willcox & Gibbs single-chain,

the Wheeler & Wilson, for instance, the bobbin is made to do the duty of the shuttle, and presents the advantage that the lower and upper parts of the machine can be driven at the same speed, instead of the lower having to be driven at double speed, to achieve the backward and forward movement of the shuttle. The figure above gives an illustration of this bobbin, the case in which it is confined, and its position in the machine. It is capable of holding "over 100 yards of No. 70 cotton, having about twice the

capacity of the largest bobbin heretofore in successful use in any lock-stitch machine."

The United States is much the largest producer of sewing-machines in the world, no other country having so many or so large factories. Some of these

factories, as the Singer, the Wheeler & Wilson, and the Howe, are of great extent, and turn out annually vast numbers of machines. As to the number of sewing-machines made, we have no record previously to the "Albany agreement" of 1856, but from that year to 1869 the sales amounted to 1,500,000 machines. From 1869 to 1878 the sales were 4,800,000, making a total of 6,300,000 machines, worth \$360,000,000, produced in the United States in 22 years. In 1880, as per the census returns, there were 106 establishments in operation, with a total capital of \$12,501,830, and an annual product of machines valued at \$13,868,188, and of cases valued at \$2,064,837. This is below the average of the 22 years preceding, but is based on a fall in price of nearly 50 per cent., so that the number of machines sold must have been considerably above that average. In the manufacture of sewing-machines only the finest material and the best workmanship are employed, and the interchangeable system is carried out to the fullest extent, the parts of the cases and the smallest parts of the machine being made exactly of the same size and pattern, so as accurately to fit in all work turned out from the same factory. This interchangeable system of parts is an American idea which is now widely adopted, and saves vast labor and expense in repairing fire-arms, watches, sewing-machines, etc., there being no longer occasion to return a broken instrument to the factory for repair, as of old. Some of the large factories perform the whole process of making cases, needles, and machines, even owning their own forests, and getting out the raw material of their operations. They have also extensive transportation facilities, and ramifications of sales agencies throughout the world.

The work on sewing-machines, at first, was comparatively coarse, but there has been a continual improvement in this respect, and these machines now rival fire-arms in accuracy of workmanship. Family machines are manufactured "which will make over 2000 stitches a minute, which will sew 600 stitches a minute with No. 60 cotton, using the same cotton as a driving belt for the machine, and which will sew either the finest gauze and tissue-paper or many thicknesses of the heaviest goods, such as leather, heavy duck, beaver, and even tin, and will execute other work requiring a combination of delicacy, accuracy, easy action, strength, and speed probably unapproached by any other class of ordinary machines." Sewing-machines are ordinarily tested, both by sewing muslin and by sewing several thicknesses of duck or beaver. As to their accuracy, it is said that "cams, which in 1870 were machined with a variation from exactness of .0015 inch, are not now allowed a discrepancy of .0005 inch," and that the work which was formerly coarse, as compared with gunwork, is now sometimes the more accurate of the two, this being the result of many improvements, not only in the design of the mechanism but in the accuracy of the machine tools. The development of the sewing-machine, in fact, is one of the most remarkable achievements of American inventive genius. (C. M.)

SEYFFARTH, GUSTAVUS (1796-1885), a noted Egyptologist, passed the last twenty-nine years of his life in the United States, and was during these years probably the most conspicuous representative of his department in America. He was born at Uebigau, near Torgau (then in the electorate of Saxony), July 13, 1796, the son of a Lutheran clergyman. Having received a thorough classical training at the famous "Fürstenschule" of St. Afra, at Meissen on the Elbe, he entered the University of Leipzig. Besides divinity, he studied not only philology and philosophy but acquired wide knowledge in various scientific departments. He gained the degree of Ph. D. and later of D. D. Having finished his academic course, he fitted himself for the career

of an academic teacher, and in 1823 received permission to lecture as *privat-docent*. One of his earlier elaborate works, *De Sonis Literarum Græcarum*, etc. (1824), was honored with an introduction written by the renowned Gottfried Hermann. The only Egyptologist of note at Leipzig in those days was F. A. W. Spolin, and when he died, in 1829, Seyffarth was intrusted by the university with the continuation of his researches. This commission suggested to him the necessity of going more deeply into the subject. Consequently, in 1826-28, he made a tour of the principal museums and collections of Europe, to study and copy on the spot the most important Egyptian papyri and kindred archæological remains. He visited Berlin, Vienna, Munich, Turin, Milan, Venice, Leghorn, Florence, Rome, Naples, Paris, London, Leyden, Amsterdam; he filled fourteen folios with copies of exquisite perfection (which he subsequently bequeathed to the Historical Society of New York). His method of interpreting hieroglyphs was fundamentally different from that of Champollion. Seyffarth held that the hieroglyphs designated the consonant elements of a syllable; e.g., *kil* (sacrifice), might be designated by a basket (*kah*), the image of an owl (*mulak*) could be read as *melek* (king), whereas Champollion taught that the hieroglyphs were symbols standing for definite letters of the alphabet. A few years after his tour, Seyffarth was made professor extraordinarius of archæology (at Leipzig), and held this position from 1830 to 1854. He did not succeed, however, in gaining academic followers of distinction, for Lepsius, Brugsch, Müller of Göttingen, Ebers, and others followed the system of Champollion. Uhlemann and Wuttke were the most noted of his own adherents. After 1840 he began to experience great difficulty in finding avenues for publication. Academic advancement also seemed to be cut off.

As a Biblical scholar Seyffarth was uncompromisingly conservative, and undertook in all chronological questions to fix dates to the day. He had developed the idea that all the chief deities, not only of the Greek Olympus but also of other pagan systems, were to be derived from the seven planets and the twelve constellations of the zodiac, and that the position of the planets at certain dates was designated on many monuments of antiquity, thus affording data for chronological computation. He taught also that the Hebrew alphabet of twenty-five letters was not only the invention of Noah, that it contained a representation of the zodiac and of the seven planets, but also that the Hebrew was the mother tongue of human speech. Vast as was the erudition of Seyffarth, these extreme chronological speculations and assertions, coupled with the abstruse and involved character of his presentation, as well as his uncompromising hostility to Champollion's system, tended to isolate him more and more from kindred scholars. Finally he took a step which he had contemplated for a number of years—he resigned his position at the University of Leipzig in 1854, and two years later came to the United States. For three years he was professor in a Lutheran theological seminary, the Concordia College at St. Louis. In 1859 he severed his connection with this institution, induced in part by his uncompromising hostility to slavery. Thereafter, with the exception of a few years' sojourn at Danville, N. Y., where he made a vain effort to establish a Lutheran theological seminary, he made New York City his residence, determined largely by the desire to avail himself of the Astor library and other literary facilities. He wrote very many papers and larger works during this period, largely relating to biblical chronology. Of these many were published in Lutheran periodicals, others in the *Transactions of the St. Louis Academy of Science*; he was also an active member

of the American Oriental Society. Some of his last labors were concerned with the interpretation of the hieroglyphs on the obelisk in Central Park, New York, erected there in 1881 by Commodore Gorringe through the munificence of Mr. Wm. H. Vanderbilt.

In the winter of 1881-82 Seyffarth, then in his 86th year, delivered a lecture on this subject in a public hall, speaking for nearly three hours. This excessive exertion, undertaken against the advice of his friends, caused the bursting of a blood-vessel in his brain. This misfortune incapacitated the aged scholar for all work and soon deprived him of many of the normal faculties. To this was added rapid deterioration of his eyesight, so that during the last three years of his life he was a physical wreck. He died in New York, Nov. 17, 1885, and was buried in the Lutheran cemetery on Long Island. The words chosen by himself for his epitaph from Horace are characteristic:

Multa fecit tulitque puer, sudavit et alsit.

(E. G. S.)

SEYMOUR, HORATIO (1810-1886), twice governor of New York, was born, May 31, 1810, in Pompey township, Onondaga Co., N. Y. His father, Henry Seymour, had moved thither from Litchfield, Conn., as one of the earliest settlers. His childhood was spent in Utica, and he was educated at Geneva College and at Capt. Partridge's military school. In 1832 he was admitted to the bar, and, as his father had belonged to the "Albany Regency," he was soon active as a Democratic politician. Besides the estate he inherited, he obtained a large fortune by his marriage to Miss Mary Bleecker. He was elected to the State Assembly in 1841, and in the next year was mayor of Utica. Returning to the legislature, he was elected speaker in 1845 as candidate of the "Hunker" faction. In 1850 he was Democratic candidate for governor, but was defeated by Washington Hunt, the Whig competitor. In 1852, however, he overcame Hunt for the same position, but having during his term vetoed a prohibitory liquor law, he was in 1854 defeated by the Whig candidate, M. H. Clark, whom the Prohibitionists had indorsed. Seymour was influential in the councils of the Democratic party during the years preceding the civil war, always urging a policy of overtures and concessions to the South. When war was begun he was active in sending New York troops to the conflict, and soon after he was elected governor, in 1862, was thanked by Secretary Stanton for his services. But soon the more vigorous war measures of the national administration encountered his opposition. In New York City, when troops were drafted in July, 1863, a riot broke out, and the mob drove off the Federal officers, overpowered the city authorities, killed some negroes, and destroyed much valuable property. Gov. Seymour endeavored to allay the passion of the mob, and made some effort to enforce order, but the riot was only quelled by the arrival of veteran troops from Washington. In 1864 Seymour was president of the Democratic National Convention at Chicago, which declared the war a failure, but he was defeated for re-election as governor in November of that year. He presided also in the next Democratic convention in New York City in 1868, and was eventually nominated by it for the presidency; but though his

ticket obtained over 2,700,000 popular votes, in the electoral college he received but 80 votes, and Gen. Grant was elected by 214. He declined thereafter to be a candidate for office, but, owing to his wealth, culture, and genial manners, still exerted powerful political influence. He was also active in the promotion of agriculture, education, and philanthropy. He was president of the National Dairymen's Association, and delivered many valuable historical addresses. He died at Utica, Feb. 12, 1886.

His uncle, HORATIO SEYMOUR (1778-1857), was born at Litchfield, Conn., May 31, 1778, being son of a Revolutionary soldier. After graduating at Yale College and studying law, he removed to Vermont and settled at Middlebury in 1799. He was a member of the council, 1809-17, U. S. senator, 1821-33, and in 1847 was made judge of probate. He died at Middlebury, Nov. 21, 1857.

SHAD. The fish commonly known by this name is a member of the *Clupeida*, or herring family, and is classed by the more recent writers in *Clupea*, the herring genus, though for many years past it has been separated as a distinct genus, *Alosa*, on account of certain peculiarities of form. The herrings have the body scaled, the head naked, are destitute of barbels, and of the adipose fin of the *Salmonidæ*, though they have many points of analogy to the latter. The shad is distinguished from the herrings by having a deep notch in the middle of the upper jaw, and by the lack of teeth on the tongue and roof of

The American Shad.

the mouth. The teeth are small and deciduous, occurring in the jaws only; the air-bladder is simple, opening in the stomach. There are, in all, over 20 species, of which the only ones of much commercial importance are *Clupea (Alosa) sapidissima*, the American shad, and *C. Reeresii*, the Chinese shad, a highly esteemed food-fish of China. There are two common European species, *C. vulgaris*, which is found in all the principal rivers, but is little esteemed as food, and *C. finta*, with which the American shad was formerly thought identical, but which has little commercial value.

The American shad, on the contrary, is one of the choicest and most esteemed of food-fishes, and ranks highest, in the estimation of many, among American fish. It is about 20 inches in extreme length, and averages about 4 lbs. weight, ranging from 2 to 6 lbs. The maximum weight at present is about 8 lbs., though shad were formerly caught of from 12 to 14 lbs. weight. Overfishing has caused a steady reduction in size and numbers. This species is of a bluish hue on the back, shading into a coppery color on the upper and a silvery hue on the

lower sides, while the abdomen is pearly in hue. The quadrangular dorsal fin shuts into a groove, and the anal is partly received in a groove. The pectorals and ventral are small; the caudal, deeply forked. The scales are large; the abdominal ridge, serrated.

The shad is found all along the Atlantic coast of the United States, from the Gulf of St. Lawrence to St. John's river, Florida, and is found everywhere within this range in sufficient quantities to make the fisheries valuable. It is not found native in the rivers that empty into the Gulf of Mexico, though recent efforts to artificially stock those rivers have met with some success. The same is the case on the Pacific coast, where artificially propagated shad have been introduced into some of the streams.

In its migratory habits the shad resembles the salmon, though it probably does not venture so far from the coast, and is supposed to be generally distributed along the coast regions of the ocean at all times. Its feeding grounds and food are probably much the same as those of the salmon. As soon as the river temperature is sufficiently high, the shad enter the streams on their spawning run, appearing in the rivers in the latitude of Charleston as early as January, and successively later up the coast until the middle of May, when they are found in the Bay of Fundy streams. The mature fish return to the ocean in August, the young in September, they being then 3 or 4 inches long. The shad is of rapid growth, and some suppose that it does not survive beyond its second year, though this is not known. The general theory that the shad always returns to the river of its birth is also speculative. It has simply some probabilities in its favor. One thing, however, seems certain, that the shad eats nothing during its river run. The stomach is invariably found empty. Yet the instinct for food is merely overcome by the stronger reproductive instinct, and the shad will occasionally rise to a fly, and afford exciting sport to anglers. The eggs of the shad number from 20,000 to 40,000, and occasionally as high as 100,000. In former times the spawning took place in the head waters of the rivers, but artificial obstructions now prevent the shad from reaching their former grounds, and the eggs must be laid lower down the streams. The mature fish return to salt water after spawning, though some seem to remain in the rivers until late in the season, and have been taken in the autumn months. The new-born shad is said to swim vigorously as soon as it breaks the shell, and to make its way at once to the mid-stream where danger from its foes is reduced. This habit gives it a better chance for survival. The young feed on small crustaceæ and insect larvæ in fresh water, and, unlike the salmon, make their way with considerable haste to the sea.

The shad is caught in drift and seine nets in the Delaware, Hudson, and other rivers, and in these localities is eaten fresh, its flesh being of delicious flavor, though the numerous small bones are a detriment. The fishery is of considerable importance in the rivers of the British Provinces, where the bulk of the catch is salted. In most of the coast rivers of the United States it is also important, though the shad has been driven from some, and is greatly diminished in most others by injudicious damming and overfishing. Thus, from being a food-staple, it has become to some degree a luxury, and alarm is entertained lest this important fish may suffer the fate of the Atlantic salmon. Its spawning habits, the vigor of the young, and their quick descent to the sea have enabled the shad to outlive the conditions which have deprived us of the salmon. Efforts were made, therefore, to assist nature in the preservation of this valuable food-supply: First, by the construction of fish-ways over dams, by the aid of which the shad might ascend to their native spawning

grounds, and the removal of the fish-weirs, which destroy the young shad by the thousands. Secondly, efforts were made to restrict fishing by regulations, in which the size of the net meshes is prescribed, so that young fishes may escape; Sunday fishing is prohibited, leaving the fish free to make their run on that day; and a day is fixed on which the fishing season must end—this being June 10 on the Delaware.

But both the natural preservatives and these attempts to assist nature have proved of little avail against persistent overfishing, stimulated by commercial greed.

In the lower reaches of our rivers, which are still accessible to the shad, the restricted spawning grounds are industriously and assiduously swept with drift net and seine, and innumerable tyke nets and pounds effectually bar all approaches, so that natural reproduction is in a great measure impracticable even for the shad that find their way into the rivers and to the vicinity of their spawning grounds. More serious than all, however, has been the transfer of the shad fisheries to the estuaries of the rivers, and the substitution of the pound net for gill net and seine. In consequence of this change in the location of the fishing grounds the larger proportion of the shad captured are now taken in salt or brackish water, in which natural reproduction cannot be accomplished. Indeed, so small is the proportion of the seasonable run of shad which succeed in making their way into and up our rivers and reaching their spawning grounds, that natural reproduction has ceased to be a material factor in influencing the conditions affecting our shad fisheries.

Resort has therefore been had, finally, to artificial shad-culture, planting the streams with multitudes of fry and young shad. This has been the work chiefly of the U. S. Fish Commission. In 1875 it began operations with a view to introducing shad in those river basins in which that species was not indigenous. But the census of 1880 and other investigations having proved that the shad fisheries of the Atlantic coast rivers were rapidly declining, the commissioners advanced to the further work of artificial propagation and distribution of young shad in those very rivers. They undertook to rescue from waste the eggs taken from the shad captured by the fishermen, to impregnate, hatch, and return these to their native waters. The conditions were shown to be highly unfavorable, but the commission attacked the problem resolutely, and the remarkable results in 1885 and succeeding years are shown in the following table:

Year.	Catch in salt and brackish waters.	Catch in the rivers.	Total catch.
1880.....	2,549,544	1,591,424	4,140,968
1885.....	3,267,497	1,906,434	5,172,931
1886.....	5,008,768	2,485,000	5,584,368
1887.....	8,813,744	2,901,661	6,715,405
1888.....	5,010,101	2,650,373	7,660,474

As the average weight of shad is four pounds, this table shows an addition to the food-supply, in 1888, of 3,519,506 pounds over that of 1880, and the money value of the increase is estimated at \$704,101. The increased production of this fishery is to be attributed to the piscicultural work of the United States Fish Commission. The increased value of this fishery is a measure of the economic value of this work to the people of the country.

In addition to the white shad there is a second species on our coast, known as the Hickory shad (*C. mediocris*). This has been given several local names, and is distinguished from the former by having a row of spots on its side. It does not oc-

cur in any considerable numbers in the rivers north of New York, but is rather abundant in some of the southern streams. It is lean, and of little value as a food-fish, being ordinarily sold at about half the price of the white shad. (C. M.)

SHAMOKIN, a borough of Pennsylvania, in Northumberland Co., is on a branch of the Philadelphia and Reading Railroad, W. of Ashland, and on a branch of the Northern Central Railroad, 19 miles S. E. of Sunbury. It has a national bank, 2 other banks, 12 churches, a high school, and other schools. It is a mining town, being in the anthracite coal region. It had in 1880 a population of 8184.

SHARON, a borough of Mercer Co., Pa., is on the Shenango river, near the Ohio boundary, 21 miles N. W. of Newcastle and 70 miles N. N. W. of Pittsburg. It is on the New York, Pennsylvania and Ohio, the Erie and Pittsburg, and the Shenango Valley Railroads. It has 2 national banks, 1 other bank, 14 churches, 5 schools, 1 daily and 2 weekly newspapers. It is largely engaged in coal and iron working, and has 3 rolling mills, steel works, chain factory, boiler works, machine shops. There are also planing mills, flouring mills, and soap works. It has water-works and gas-works. Natural gas is largely used. Sharon was settled in 1815, and incorporated as a borough in 1843. Its property is valued at \$3,500,000; its public debt is \$41,500, and its yearly expenses are \$37,000. Its population in 1880 was 5684.

SHARSWOOD, GEORGE (1810-1883), jurist, was born in Philadelphia, July 7, 1810. His grandfather, by whom he was brought up, owing to the early death of his father, had been a captain in the Revolutionary army, and was active in local politics. The grandson, after graduating at the University of Pennsylvania in 1828, studied law with Joseph R. Ingersoll, to whom he dedicated his treatise on *Professional Ethics* (1854). In 1837 he served in the State legislature and again in 1841-42. The report made by him at this time as secretary of a committee of stockholders to examine the affairs of the U. S. Bank may be found in Benton's *Thirty Years' View* (II, 370). His mastery of numerous branches of law was well displayed in his editions of various English text-books, including *Blackstone's Commentaries*, and in the *American Law Magazine*, which he conducted for three years. In 1845 he was nominated by Gov. Shunk associate judge of the district court of Philadelphia, and soon became president of the court. When the judiciary was made elective, in 1850, Judge Sharswood was nominated unanimously in the conventions of five political parties. After serving in the district court for twenty-two years, he was in 1868 elected to the State supreme court. He then resigned the professorship of law in the University of Pennsylvania, which he had held for eighteen years. When he retired from the Supreme bench, at the close of his term in 1883, he was honored with a public testimonial in which the highest tribute was paid to his judicial ability. Throughout his career he had maintained the Democratic view of strict construction of the Federal Constitution; in particular, he had denied the constitutionality of making greenbacks a legal tender. Besides his works already mentioned, he published *Lectures on Commercial Law* (1856) and *Law Lectures* (1869). His edition of *Blackstone's Commentaries* is accepted as the standard in America, and his annotations on other works were republished in England. He died at Philadelphia, May 28, 1883.

SHAW, LEMUEL (1781-1861), jurist, was born, Jan. 9, 1781, at Barnstable, Mass.; graduated at Harvard, 1800; served for a year as usher in the Franklin (now Brimmer) school, Boston; was assistant editor on the *Boston Gazette*, and studied law under

David Everett. In 1804 he was admitted to the bar, and began practice in Boston, gradually rising to eminence. He was a member of the State legislature from 1811 to 1815, and again in 1819, and of the convention for revising the laws of the State in 1820. In 1821-22 he was State senator, and also in 1828-30. In 1830, though never holding any previous judicial position, he was made chief-justice of the supreme court of Massachusetts, holding the office till his resignation in 1860. Here he acquired a reputation as a jurist second only to that of Theophilus Parsons. His reported decisions are to be found in the reports of Pickering, Metcalf, Cushing, and Gray, constituting in all 50 volumes. He was an overseer of Harvard College for 22 years, and received the honorary degree of LL. D. from it in 1831, and from Brown University in 1850. Probably his most important writing, apart from his decisions, is the charter of the city of Boston, draughted by him in 1822. He died in Boston, March 30, 1861.

SHAYS, DANIEL (1747-1825), from whom the rebellion in Massachusetts in 1786 takes its name, was born at Hopkinton in 1747. He was an ensign at the battle of Bunker Hill, and afterward a captain. At the close of the Revolutionary war the people of western Massachusetts found themselves burdened with debt and taxes, and laid the blame on the legislature. They demanded the removal of the General Court from Boston, the reduction of salaries of officials, the relief of debtors, and the issue of paper money. Parties of armed men interrupted the sessions of several county courts. Capt. Shays was chosen as a leader, and in December, 1786, prevented the courts from meeting at Worcester and Springfield, and then made an unsuccessful attempt to capture the arsenal, Jan. 25, 1787. His men, poorly clad, had already suffered severely from the intense cold, and were thoroughly alarmed at the vigorous measures taken against them by the State government. Gen. Benjamin Lincoln surprised and dispersed them at Petersham, and Shays fled to Vermont. He was afterward pardoned, and finally even pensioned for his services in the Revolution. He died at Sparta, N. Y., Sept. 29, 1825.

SHEA, JOHN GILMARY, historian, was born in New York City, July 22, 1824. Educated at the grammar school of Columbia College, he was admitted to the bar, but has been chiefly engaged in literature. He spent six years in the Society of Jesus, and devoted much attention to the history of Jesuit missions in America. His publications include *Discovery and Exploration of the Mississippi Valley* (1853); *Catholic Missions among the Indian Tribes* (1854); *Bibliography of American Catholic Bibles* (1859); *Early Voyages up and down the Mississippi* (1862). He edited several works relating to colonial New York and to the American Indians. From 1859 to 1865 he was editor of the *Historical Magazine*, and he has since been connected with various journals and monthlies. To American Catholic literature he has been a liberal contributor of translations and editions of foreign works, as well as original publications. Besides correcting and editing English Catholic Bibles, he issued a *Bible Dictionary* (1873); *Child's History of the United States* (3 vols., 1872-73); and various school text-books. He contributed to this work the article on ROMAN CATHOLIC CHURCH.

SHEBOYGAN, a city of Wisconsin, seat of Sheboygan county, is on Lake Michigan at the mouth of the Sheboygan river, 52 miles north of Milwaukee. It is on the Milwaukee, Lake Shore and Western, and the Chicago and Northwestern Railroads. It has a court-house, 2 hotels, German bank, 5 churches, 2 daily and 4 weekly newspapers, two of which are German. There are 8 foundries, 3 planing mills, and factories manufacturing chairs, toys, furniture,

and shoes. There are also tanneries and breweries. Sheboygan has a good harbor, is lighted with gas, and has street cars, parks, and water-works. There is an artesian well 1700 feet deep, whose waters are medicinal. The population is chiefly of German origin, and in 1880 was 7314, but is now estimated to be twice as great.

SHEDD, WILLIAM GREENOUGH THAYER, theologian, was born at Acton, Mass., June 21, 1820. He graduated at the University of Vermont in 1839, and at Andover Theological Seminary in 1843. After a brief pastorate in the Congregational church at Brandon, Vt., he was made professor of English literature in the University of Vermont in 1845. Thence he passed in 1852 to Auburn Theological Seminary as professor of sacred rhetoric, and in 1854 became professor of ecclesiastical history in Andover Seminary. In 1862 he was called to be associate pastor with Rev. Dr. Gardiner Spring in the Brick Presbyterian Church, New York City. In 1864 he was made professor of Biblical literature in Union Theological Seminary, and in 1874 became professor of systematic theology there. He edited Coleridge's *Works* (1853) and *Augustine's Confessions* (1860); translated some works from the German, published *Discourses and Essays* (1862), *Lectures on the Philosophy of History* (1862), and a valuable *History of Christian Doctrine* (2 vols., 1864). Dr. Shedd edited the *Gospel of Mark*, in Dr. Schaff's edition of Lange's *Commentary*, and has since published *Homiletics and Pastoral Theology* (1867) and *Sermons to the Natural Man* (1871); *Commentary on the Epistle to the Romans* (1879); *Sermons to the Spiritual Man* (1884); *Doctrine of Endless Punishment* (1885); *Dogmatic Theology* (2 vols., 1888).

SHEEP. *Ovis*, the genus of the sheep, is by some authors considered to represent a group of three or four genera, embracing in all, according to a recent systematist, about 21 species. The more general opinion, however, makes but one genus and a much smaller number of species. In the wild state both sexes of the sheep are horned. The horn is large, angular in form, and spirally twisted, curving in such a manner that the tips point forward. It is transversely striated or ridged, and in some species is very large. The hair is of two kinds, a woolly internal coat, and an exterior covering of closer and harsher hair.

In its native state the sheep closely approaches the goat in energy and activity. It is of larger size and equal muscular power, and is, like it, a mountain dweller, leaping from rock to rock with the greatest swiftness and agility. Of the wild species the most important are the Musmon (*O. musimon*) of European Turkey and the mountainous islands of the Mediterranean; the Argali (*O. ammon*) of the mountains of Central Asia; the African bearded sheep (*O. tragelaphus*) of Egypt and Barbary; and the Rocky Mountain sheep of America (*O. montana*). The latter species, called Big Horn, is found from the hills of western Nebraska to the coast ranges of the Pacific, and from the Rio Grande far to the north. It is said to range to 68° north latitude, but is not found in the hills of the Hudson Bay region. In the mountains of its range it occurs in flocks of from three to thirty, and is remarkably agile and daring. From which of these species the domestic sheep (*O. aries*) originated is not known. It has been so long domesticated that no close resemblance to any wild species remains. It differs from the wild sheep in its more massive trunk, slender legs, and less graceful aspect of body, and in the great predominance of its woolly over its hairy covering. The horns have varied or disappeared, the ears and tail lengthened, and other modifications taken place. In a state of captivity the sheep is markedly grega-

rious, timid, and defenceless, and has become thoroughly adapted to life on level plains. In these respects it has changed much more than the goat.

The domestic sheep has deviated into a great variety of breeds, several of them with extraordinary peculiarities. One of these is the fat-tailed sheep of southwestern Asia, in which the tail is so loaded with fat as to sometimes weigh twenty pounds; another, the tailless fat-rumped sheep of the deserts of Tartary; and a third, the Fezzan sheep of Africa, distinguished by its arched forehead, long ears, and mane on neck and shoulders. In the modern breeding of the sheep two distinct purposes have been kept in view, the production of wool of superior quality and quantity and that of choice and fine-flavored meat. No breeder has yet succeeded in uniting these qualities perfectly in a single breed, and wool and mutton producers are obliged to pursue opposite courses. The growth of fine mutton has long been closely attended to in England, and several of the breeds of that island, notably the Southdown, are celebrated throughout the world for their excellence in this particular. Of wool-producing sheep the best of all known breeds is the Merino, which in recent times has been brought to great perfection in Spain. It is probably the descendant of an ancient breed of western Asia, from which all the fine-wooled sheep have been derived. From Spain the Merino has been introduced into France, Saxony, and other countries of northern Europe, where it has been crossed with the native sheep. It has also been largely imported into the United States, and forms the basis of much the greater percentage of our sheep. The Merino differs from the English sheep in having wool on the forehead and cheeks. It is a large breed, with heavy horns, and fine, long, soft wool, curling in close tendrils, and so oily naturally that the dust adheres to it and gives it a dingy appearance, though it is perfectly white when washed. The average weight of the fleece is four to five pounds. Recent breeding, however, has much improved the qualities of the Merino, and the wool clip of American sheep sometimes reaches a much greater average than this.

The first sheep brought into the present limits of the United States were landed at Jamestown in 1609. Sheep were introduced into New York and Massachusetts about 1625. These increased into considerable flocks, and America was well provided with sheep in 1801, the year in which the first Merinos were brought to this country. These were imported by Mr. Seth Adams to Dorchester, Mass. He afterward took his flock to Ohio, where its descendants were lost in cross breeding. In 1802 Col. David Humphreys brought from Spain to Derby, Conn., 90 choice Merinos. Of this flock one ewe was bought by David Atwood, of Vermont, and became the basis of the famous Atwood flock, the finest flock of pure-blooded Merinos in this country. Merino sheep were for a time highly popular, and were imported in large numbers, more than 15,000 being brought over in 1810 and 1811. After the war they fell greatly in price and most of the flocks were dispersed and lost, though they have undoubtedly greatly benefited the sheep of the United States by crossing with the older breeds. The careful breeding of Merinos has mainly been prosecuted in Vermont, where there are several celebrated flocks, while the yield of wool has greatly increased. In Spain the best rams yield only from 6 to 8 lbs. In America the yield has increased until 20 lbs. and, in extreme cases, much beyond this is obtained. The heaviest fleece yet cut from an American Merino was 44 lbs. 4 oz. Such sheep, however, generally lack vigor, and the forcing process by which such yields are produced is not profitable. One unfavorable result of very high breeding

is to augment the constitutional lack of fertility of the Merinos.

We have spoken particularly of the introduction of the Merino to America, from the fact that

its stock from the prairie region. Throughout this whole western country, which has abundant pasture admirably adapted for sheep culture, the increase of sheep flocks within recent years has been very great. In Texas the wool clip increased from 7,000,000 lbs. in 1870 to 22,000,000 lbs. in 1880, and the increase elsewhere has been equally promising.

Of the English breeds introduced into this country the principal are the Southdown, Leicester, and Cotswold. Of these the Southdown is preferred by many to the Merino, being one-third larger, harder, much more prolific, and yielding better mutton. Its wool is large in quantity and fair in quality. The Leicester breed has a heavier fleece and carcass than the Merino, but needs more food.

American Merino Sheep.

this breed now forms the basis of the American sheep industry. In the words of a recent authority: "England is a mutton, America a wool country; the sheep of the United States are 95 per cent. Merino." Of English sheep there is only one breed, the Southdown, whose wool is comparatively fine. On the other hand, the mutton of the mature American Merino is often excellent, and occasionally approaches the Southdown in quality. On the Atlantic slope of the United States the Merino sheep has no pre-eminence, except in limited localities, as in Vermont. There is a greater proportion of the old American stock, described by Youatt as a mongrel Southdown with Leicester and Cotswold. In most of the southern States there has been little careful breeding, the sheep being left to care for themselves. In the West the breeds are better defined and more improved. Much attention has been given to the breeding of the Merino in western Pennsylvania, West Virginia, and Ohio, and more recently in Michigan and Wisconsin, in which States wool predominates over mutton production. Less care has been given to the Merino in the prairie region, and there has been much cross breeding. The English long-wooled sheep appear to do better in this region, they being less affected by its characteristic disease of foot rot. In Texas and New Mexico, among the most important of our sheep-raising districts, the original sheep was the Mexican, a descendant from the *Chourro* of the Basque provinces of Spain. This is a long, lank, light sheep, with little and poor wool, but with the advantage of being very hardy and prolific. The Merino was introduced into Texas in 1852, and has greatly increased in that State, its constitutional defects being overcome by crossing with the Mexican stock. The sheep stock of Texas is now said to be $\frac{1}{2}$ Mexican, $\frac{1}{2}$ half-Mexican, and the remainder half to pure Merino. In New Mexico the great bulk of the sheep are Mexican. California, which is now one of the most important of our sheep-raising States, began this industry in 1852. The sheep there are said to be 75 per cent. pure Merino, but, having been grafted on the old Mexican or Mission stock, are very hardy and prolific, while excellent wool-bearers. The remainder of the Pacific States and Territories have derived their sheep from California, their stock being mostly Merinos. Colorado, an important sheep-raising State, has obtained

Its wool is long staple, but, like English wools generally, is deficient in felting properties and therefore unsuitable for cloths. As a combing wool it stands first, and is used to manufacture the finest worsteds. The Cotswold is also much esteemed, yielding excellent mutton and fair wool. As a rule the fine-wooled sheep, like the Merino, are less profitable as mutton producers than the coarse-wooled, no satisfactory combination of excellence in mutton and fineness in wool having yet been produced. Sheep generally produce finer wool in cold than in warm countries, though in the latter the yield is greater, probably from the greater abundance of nutritious food.

The principal breeds of sheep now raised in the United States are the (so-called) Natives, the Spanish and the Saxon Merinos, the New Leicester or Bakewell, the Southdown, the Cotswold, the Cheviot, and the Lincoln. The common sheep of Holland were early imported by the Dutch settlers of New York, but do not now exist as a distinct variety. The broad-tailed sheep of Asia and Africa has been several times imported from Persia, Tunis, Asia Minor, etc. The United States, on the other hand, has done little in the way of producing distinctive breeds, perhaps from lack of efforts at selection. The miscalled Native is in no sense indigenous, but is the outcome of indiscriminate crossing of the earlier importations, mostly of English varieties. Two races of distinctive character have arisen, the Otter and the Smith's Island breeds, but no trace of them is now known to exist. The Otter made its appearance in Massachusetts in 1791. A lamb was born with longer body and shorter legs than usual, and as this promised to check the tendency to leap over fences, it was carefully bred from; but the breed has been allowed to die out.

A very great variety of crosses have been made between the Spanish, English, and Natives, this having been practised to such an extent that few United States flocks are now of pure blood. This has not been wholly the result of carelessness, but was done in many cases advisedly for the purpose of combining the advantages of separate breeds. And even where efforts to preserve purity of blood have been made, certain variations have arisen incident to a new country and new management. Thus the American Merinos have diverged into varieties presenting marked differences from each other and from

the original Spanish. These may be classed under three heads. The first is a large, short-legged, strong, and exceedingly hardy sheep, with heavy fleece, ranging in quality from medium to fine, free from hair in well-bred flocks, the wool being longish on both back and belly, and exceedingly dense. The yield of fleece is heavy, averaging from 8 to 12 lbs. The second is a smaller and less hardy variety, the wool usually finer, and covered on its extremities with a black, pitchy gum. The fleece is about one-fourth lighter than that of the above. The third variety is still smaller and less hardy, with lighter but finer fleeces, which are free from gum. It closely resembles in form and wool the Saxon Merino, and may have some Saxon blood. The first variety is a larger and stronger sheep than the original importation from Spain, and in well-selected flocks yields much heavier fleeces and of much better quality than those obtained in Spain. The Merino, though native to a warm climate, becomes readily acclimated to cold regions, and flourishes as far north as Sweden without degeneration. It is patient and docile, and of great longevity, retaining its teeth and breeding 2 or 3 years longer than the common sheep, and at least 6 years longer than the improved English breeds.

What are known as the Saxon Merinos originated from a flock of 200 Spanish sheep imported to Saxony in 1765. They were bred with great care, and improved over the original in quality of wool, though hardiness and other important qualities have been sacrificed by the German shepherds in their too exclusive attention to wool product. There are two distinct breeds of the Saxon, one with shorter legs and stouter body than the other. The first Saxons were imported to America in 1824, with the exception of a small flock of 6 or 7 brought earlier. Many were brought later. These have been mixed with natives and Spanish Merinos, to the advantage of their hardiness. The American Saxons yield a fleece of 2 to 3 lbs. They are comparatively tender, need regular and good food, and good shelter. They resemble the Merinos in docility, longevity, and lateness of maturity, and yield a fleece not so fine as that of Saxony, but usually much finer than that of the American Merino.

Of the English breeds the Leicester was introduced into the United States about 1825. Its mutton has deteriorated in quality from that of England, being too fat, and the fat and lean too little mingled, for the American taste. Its wool is not in much demand here, from the dearth of worsted manufacturers in America. It is comparatively short-lived and, being a lowland sheep, does not stand our winters so well as the Southdown, which is of upland origin, and is quite hardy and healthy. Like the Leicester, it is short-lived. Of the broad-tailed sheep there are some of pure blood within the United States, but they are as yet of no industrial importance.

The celebrated Improved Kentucky breed was formed by a general crossing of the Native, Merino, and the English breeds, but is considered one of the most permanent of American breeds, propagating with the certainty of the average thoroughbred. Crosses between the distinct varieties of Merinos have been highly successful, and the American Merino of to-day is the result of a fusion of several Spanish flocks. The "Victor-Beall Delaine," the "Blacktop," and the "Improved Saxony," all excellent American breeds, are the result of crosses between Spanish and Saxon Merinos. Similar crosses of American with French Merinos have not resulted advantageously in the eastern States, but have proved successful in California. In Oregon and California the American and Australian sheep have been bred together, with very satisfactory results. It is said that the cross between a Merino

ram and a Southdown ewe, and *vice versa*, yields the best mutton known, with the exception of the little Welsh mountain sheep. It is claimed to be superior to pure Southdown mutton.

In the far West the question of food-supply for sheep is a very important one. Those vast regions are widely adapted to pastoral pursuits, and seem destined to become the future home of the American Merino, but some system of shelter and artificial provision of food is necessary to guard the flock against the occasional heavy snows. The prairie hay is generally excellent, and the grass known as alfalfa has proved well suited to sheep pasture in California. The Bermuda grass, so common and dreaded by the cotton planters of the South, has been found to succeed well in the alkaline soil of the West, and is admirable for sheep. *Festuca*, a large genus of grasses, follows sheep and cattle everywhere; *F. ovina*, one of the best of sheep grasses, having followed the sheep around the world. There are several species of the bunch grass of the western plains which are also excellent, and by a system of gathering sufficient of these grasses to carry the flocks over the dangerous periods of the winter the sheep industry may be almost indefinitely extended in the West. Sheep are excellent scavengers, and thrive where most other animals would starve. They bite the grass much closer than the other domestic animals, and are fond of plants which the latter will not eat. They soon clear fields of weeds, briars, and bushes, and by their droppings, which have excellent fertilizing properties, they aid greatly in preparing the land for the plough. Where briars are too thick and high they need to be burned; yet this does not deter the sheep, which crop down all the young shoots which appear on such burned-over ground, with an apparent preference, as if the ashes gave a relish to their food. Their close cropping, indeed, is fatal to certain species of grass, and in sheep pastures it is necessary to select grasses which will bear this. (See FORAGE CROPS.)

Sheep are subject to many diseases which interfere seriously with their profitable raising. The most troublesome of these is the foot rot. This arises from the suppression of the peculiar glandular secretion which exudes between the toes of the sheep. Moist ground promotes this suppression, which is followed by dangerous inflammation. They suffer also from insects, and particularly from a botfly, whose larva is introduced into their lips and nostrils, and makes its way inward to vital regions. There are other parasites and diseases which add greatly to the cares and risks of the shepherd.

The number of sheep in the United States in 1880 was 42,192,074, of which 35,192,074 were on farms, and 7,000,000 estimated on ranches and ranges. In 1888 the number was 43,544,755. The wool clip of the former-named year was 240,681,751 lbs., of which the principal quantity came from Ohio, California, and Michigan. The price of sheep advanced steadily from 1879 to 1883, after which a decline set in, the price in 1888 being \$2.05, and the total value of sheep, \$89,276,026. Of this value Ohio and California return over \$10,000,000 each; Texas, nearly \$7,000,000; New York and Michigan, over \$5,000,000; Oregon, nearly \$5,000,000; and the other States in rapidly diminishing proportions.

(O. M.)

SHELBY, ISAAC (1750-1826), soldier, and governor of Kentucky, was born near Hagerstown, Md., Dec. 11, 1750. His father, Evan Shelby, was of Welsh descent and local prominence. In 1774 Isaac fought in his father's command against the Indians at Point Pleasant, Va. In the Revolutionary war he served as captain, commissary, major, and finally colonel, in Virginia and the Carolinas. His most noted exploit was his gathering a force of hardy

riflemen from the Watanga settlements, and leading them across the mountains against the disciplined Tories under Major Patrick Ferguson, whom he completely defeated at King's Mountain, Oct. 7, 1780. This unexpected blow greatly revived the patriot cause in the Southern States. In the next year Shelby assisted Marion, and led 500 men to the aid of Gen. Greene. He was then elected to the North Carolina legislature, and received from that body a vote of thanks and a sword. In 1783 he removed to Kentucky, and took part in framing a constitution for that State, on its separation from Virginia. He was chosen its first governor, 1792-96, and was again called to this post in 1812, when the second war with Great Britain was declared. He led a force of 4000 to Gen. Harrison's army, and fought at the battle of the Thames. His term as governor expired in 1816, and he was invited by Pres. Monroe to become secretary of war, but declined on account of his age. Yet in 1818 he was joined with Gen. Jackson in making a treaty with the Chickasaw Indians. He died at Traveller's Rest, Lincoln Co., Ky., July 18, 1823.

SHELTON, FREDERICK WILLIAM, clergyman and author, was born at Jamaica, L. I., in 1814. The son of a physician, he graduated at Princeton in 1834, and employed his pen in writing for the *Knickerbocker Magazine*. His rhymed satire, *The Trollpiad; or, Travelling Gentlemen in America*, was published anonymously in 1837. After being ordained in the Episcopal Church, in 1847, Shelton ministered to parishes at Huntington, L. I., Fishkill, N. Y., and Montpelier, Vt. He died at Carthage Landing, N. Y., June 20, 1881. His books, *The Rectr of St. Bardolph's* (1852), *Up the River* (1853), and *Peeps from a Belfry* (1855), exhibit his experiences and reflections as a rural clergyman. His *Sultan and the Dragon* (1850) and *Crystalline* (1851) are fairy tales with a moral.

SHENANDOAH, a borough of Schuylkill Co., Pa., is on the Leshigh Valley, and the Philadelphia and Reading Railroads, 13 miles N. of Pottsville. It has a national bank, 12 churches, several schools, 2 daily and 3 weekly newspapers, and a foundry. The business is almost exclusively mining and shipping anthracite coal. (See ANTHRACITE under COAL.) The collieries in the vicinity produce to the value of \$2,500,000 yearly. Shenandoah was settled in 1852, and incorporated in 1863. The inhabitants are chiefly of foreign birth. The borough has gas and waterworks. Its property is assessed at \$1,600,000; its public debt is \$75,000, and its yearly expenses are \$10,000.

SHENANDOAH VALLEY owes its historic interest to the American civil war, and is here described with reference to the campaigns which have rendered it memorable. It takes its name from the Shenandoah river, which is formed by the junction of two forks—the North and South—at Front Royal. These forks are separated for 40 miles by the isolated range of the Massanutten. The South Fork, or the Shenandoah proper, rises by three branches a little south of the parallel of 33° N. lat. From Front Royal the river skirts the western base of the Blue Ridge, till it falls into the Potomac at Harper's Ferry, after a total course of 170 miles. The valley between the Blue Ridge, on the east, and the North mountain, on the west, has an average breadth of 20 miles, and stretches from the Potomac beyond the sources of the Shenandoah, and into North Carolina. Its direction is from N. E. to S. W. The valley divides itself, by a line drawn through Lexington, into two parts—the southern, mountainous, rugged, and unfit for military movements; and the northern, rich and fertile, affording an army a natural avenue of communication, while furnishing an inexhaustible granary for its commissariat. Besides the Shenandoah,

the other streams of the region are the North river, an affluent of the James, on which Lexington stands; the Kanawha, whose main branch, New river, flows N. W. across the valley from its S. E. angle, until it enters West Virginia; Cedar creek, falling into the South Fork at Strasburg; and the Opequan, a small stream, rising in Frederick Co. and flowing N. into the Potomac near Williamsport.

When Virginia seceded, in May, 1861, the civil war had already begun. From its proximity to the national capital, this State was plainly indicated as the field of the struggle for the nation's life. The capital of the Southern Confederacy was promptly transferred to Richmond, and the ground between the two capitals became, for four years, the scene of the most momentous American conflicts. The valleys of Virginia, as grand military avenues, were the favorite field of strategy for both parties, and their railroads were a main object of attack and defence. The main Union line was the Baltimore and Ohio, traversing the north of the valley. The Confederate lines were the Virginia Central, whose chief valley station was Staunton, and the East Tennessee, which connected Lynchburg and Knoxville. Military operations were facilitated by the fine roads connecting the towns, while the gaps of the Blue Ridge gave access to East Virginia. Through one of these gaps—Manassas—there was a railroad, but it was broken up early in the war. The valley was the scene of the operations of the Confederate generals, Jackson, Ewell, Stuart, and Early, on a large scale; and of the romantic enterprises of Ashby, Mosby, Imboden, and Gilmor.

The initial campaign of the war in 1861 turned on the effective use made of the military advantages of the valley by the Confederate general, J. E. Johnston. Gen. Robert Patterson had crossed the Potomac to watch his movements and prevent his joining Beauregard, whose army was threatened by McDowell's advance from Washington. But Johnston, with the main body of his "Army of the Shenandoah," slipped through Ashby's Gap and took the railroad to Manassas. This re-enforcement caused the defeat of the Union army on July 21. (See BULL RUN.)

At the beginning of the campaign of 1862 Gen. Johnston, still in command, sustained a check from Gen. James Shields; but for this he indemnified himself a few months later when he fell on Shields at Port Republic, defeated Fremont at Cross Keys, captured the garrison of Front Royal, drove Gen. N. P. Banks across the Potomac, and, by alarming Washington, prevented the intended junction of McDowell's army with McClellan's, and thus, in the judgment of some military critics, averted the capture of Richmond at that time. It was there in the Shenandoah Valley that Gen. "Stonewall" Jackson began to practise in his unique and masterly way the game of war. From it he hastened to turn McClellan's right in his Peninsular campaign. At the close of that campaign the command of the Confederate army had devolved on Gen. Robert E. Lee.

When the safety of Richmond was assured by the withdrawal of the Union army from its vicinity and the defeat of Gen. Pope at the second battle of Bull Run (*q. v.*), Gen. Lee determined in the autumn of 1862 on a counter movement—the invasion of the North, and transfer of the conflict to Maryland and Pennsylvania. The Shenandoah Valley was his line of communication, and at Harper's Ferry he captured 11,000 men, 73 guns, and 13,000 stands of arms. He was repulsed, however, at Antietam (see SOUTH MOUNTAIN) and was obliged to seek rest again in the valley.

In the next year, after defeating Hooker at Chancellorsville (*q. v.*), Lee used the valley again as his route for the invasion of Pennsylvania. In it Gen.

Ewell captured several thousand Union troops and over 20 guns from Milroy. After the defeat of his army at Gettysburg Lee fell back again by the way of the valley and posted his forces along the Opequan. The importance of the Shenandoah Valley had now been thoroughly tested and proved. Yet the events of the succeeding campaigns gave it still greater prominence. Not until this granary and highway could be wrested from the Confederate control could the Union designs against Richmond be brought to a successful close.

In March, 1864, Gen. U. S. Grant was promoted to the command of the entire Union army. When he crossed the Rapidan, in the beginning of May, three movements were in progress in the Shenandoah Valley—those of Crook and Averell down the Kanawha from West Virginia, and that of Sigel up the Shenandoah, the common objects being the breaking up of the Virginia Central and Tennessee railroads and the destruction of the works at Wytheville and Saltville, and then marching their united troops under Sigel to Lynchburg in support of Grant. The scheme miscarried in its main object. Sigel, in particular, was defeated by Breckenridge at New Market, and the command of the Department of West Virginia was transferred from him to Gen. Hunter. Crook and Averell returned to West Virginia.

The second attempt to effect these ends was made in the end of May under Gen. David Hunter. Moving up the valley he, on June 5th, encountered the enemy under Jones at Piedmont, and drove it back to Staunton with loss of guns and 1500 prisoners. Jones was killed. On Crook's approach from the west the remainder of Jones' force, abandoning Staunton, fled, pursued by Hunter to Waynesboro'. At Staunton, the factories and stores were destroyed, the railroad broken, and a junction effected with Crook and Averell. On June 10th Hunter's consolidated force, 18,000 strong, set out to follow the enemy farther up the valley. On reaching the New river, opposite Lexington, he found the bluff on the farther bank occupied by the enemy under McCausland. The resistance was easily overcome, and Lexington occupied. Here considerable damage was inflicted, and a statue of Washington carried off.

Hunter now directed his march on Lynchburg, and on the 17th touched the enemy's first line within six miles of the town. Here he encountered Breckenridge, while on the same day Early, whom Sheridan should have detained, arrived at Lynchburg from Charlottesville. Severe fighting occurred on the 18th, but Hunter found the enemy so strong that, 9 p. m., he commenced a retreat which was to continue day after day, with Early in close pursuit, till, on the 27th, his exhausted and half-famished soldiery found supplies and rest, within a day's march of Ganley Bridge, W. Va. Next day Hunter retired to Loup Creek, near Ganley Bridge, and the retreat was at an end.

Hunter's retreat to West Virginia left the valley open to the enemy. Early seized the opportunity to make his famous raid into Maryland and advance on Washington. On July 11th he stood within view of the capital, but, re-enforcements arriving from all quarters, he had no alternative but to withdraw, followed on his retreat by Wright. On the 14th he re-entered the valley through Snicker's and Ashby's Gaps. At Snicker's Ferry he crossed the Shenandoah, and, repulsing Crook in his endeavor to cross in pursuit, he moved leisurely on to Winchester and finally to Strasburg. But in the meantime Hunter's forces from the west were coming on the scene. On the 19th Averell moved from Martinsburg, and on the 20th, encountering Ramseur three miles north of Winchester, put him to flight with loss of guns and prisoners. At Kernstown, on the 22d, Averell was

joined by Crook, who took the command. Next day they were attacked and defeated by Early, Crook retreating into Maryland.

Early was now again master of the valley, and began afresh to destroy the B. & O. Railroad at Martinsburg. Grant, perceiving that the valley, dominated by Early, would be a permanent menace to the North, determined to accumulate an overwhelming force against him. With this view a "Middle Military Division" was created, and Gen. Phil. H. Sheridan, on August 7th, named to the command of it. His army—afterward to be known as "The Army of the Shenandoah"—consisted of the 6th and 19th Army Corps, Crook's infantry, Torbert's division of cavalry, and four brigades of Hunter's cavalry—amounting in all to 45,000 men, with 22 batteries of 6 guns each. Some of these, however, had yet to report.

Sheridan at once selected a strong position (to which he repeatedly returned) stretching from Clifton to Berryville, near the line of the Harper's Ferry and Winchester Railroad. Opequan Creek ran along its front on the east. Early stood in the vicinity of Bunker Hill, to the northwest of the Union lines. Observing, on the 10th, that Sheridan was in movement to interpose between him and Winchester, he moved rapidly southward, and covered that town. Next day, in order to be nearer the re-enforcements that he knew to be approaching him from Lee, he moved farther south, through Strasburg, and on the 12th took up a strong position on Fisher's Hill, two miles to the south of Strasburg. Sheridan followed him as far as Cedar Creek, and considerable fighting took place. At Fisher's Hill Early was joined by Gen. Anderson, bringing with him Kershaw's infantry, Fitz Lee's cavalry, and Cutshaw's artillery, and also by McCausland's infantry, whereby his force was brought close up to 40,000 men, with 14 batteries of 6 guns each. Sheridan, now considering the enemy too strong to be assaulted in such a position, retired on the 17th by way of Winchester to the position whence he had moved a week previously. Here he was re-enforced through Snicker's Gap, and Averell had reported at Martinsburg and Duffie at Charlestown. To impede pursuit Sheridan destroyed all the crops and provisions south of Winchester, and drove off all the cattle. On the 19th Early moved his forces to Bunker Hill, and on the 21st he and Anderson determined to assault Sheridan, whose main force now lay near Charlestown. The Opequan was easily crossed, and a sharp conflict ensued, which resulted in Sheridan moving back to a position before Halltown, the strongest in the valley. After delaying three days before the Halltown lines, Early, leaving Anderson and Cutshaw to watch these in front, moved north to Shepherdstown, repeated conflicts with Torbert's cavalry taking place on the way. Discovering here that it was as impossible to effect anything against Sheridan on his flank as on his front, he withdrew across the Opequan to his old position at Bunker Hill and Winchester, while, on Sept. 3d, Sheridan returned to his familiar Clifton-Berryville line. Meanwhile Lee had recalled Anderson to himself, and on the same day that Sheridan made his movement he started for Berryville, to cross the Blue Ridge on his way to Richmond. The consequence was he came into collision with the Eighth Corps, just going into camp. After a stout fight Anderson returned to Winchester, to take, later, a more southerly route. For ten days after this there was constant manœuvring and skirmishing along the Opequan. Gen. McIntosh on the 13th capturing the Eighth South Carolina Infantry. Nothing decisive, however, was effected, and on the 14th Anderson, with Kershaw and Cutshaw, left to join Lee.

Sheridan saw that the moment he had waited for had come, and proceeded at once to seize it. Early was not only weakened by Anderson's and Kershaw's

withdrawal, but he further depleted his ranks by sending a large section of his army to Martinsburg. Thus on the eve of a day destined to witness a great and decisive battle, the Confederate forces, instead of being concentrated, were strung along the pike. The centre of the position was Bunker Hill, while Winchester was strongly held by Ramseur, and there the fighting was most severe. By a rapid advance along the Winchester pike Sheridan saw that he could gain the rear of the Bunker Hill position. The 6th and 19th Corps began to move at 3 o'clock, morning, followed in three hours by Crook, who joined the main column at the crossing of the Opequan. The enemy resisted the Union advance obstinately, and near mid-day its left was so seriously shaken that the whole attack felt the effect. But by the advance of Russell's division the line was re-established, and the struggle renewed. At length the Confederates began to give way, and as day ended Early's forces broke through Winchester in full retreat. The conflict was a bloody one. The Union loss was from 4900 to 5000; Early's was from 3900 to 4000, and of his casualties 2000 were prisoners. By promptly recognizing his defeat, Early was enabled to save his trains and stores, but he left behind him as trophies five pieces of artillery and nine battle-flags. The fight had been a long and hard one, and there was no attempt at infantry pursuit. The cavalry followed up the pike only to Kernstown, where Ramseur covered the retreat, which, under the shelter of darkness, was continued toward Strasburg. Such was the Battle of Opequan, of which the moral effect in the North was all the greater that, hitherto, it had heard of nothing save discomfiture within the valley, so that it had come to be known as "The Valley of Humiliation."

Next day Early continued his retreat to his old position at Fisher's Hill. Here the valley, through the interposition of the Massanutten, narrows from 20 miles to four, so that the hill offers a strong defensive position—the first that a force advancing from Winchester meets with. At daylight on the 20th Sheridan set forth up the pike in pursuit, and during the afternoon the main body of his army crossed Cedar Creek and went into position on the heights fronting Strasburg. By evening the northern part of that city was occupied by Union pickets, and the southern by Confederate. The 21st was spent by Sheridan in positioning his infantry, his purpose being to repeat the tactics of the Opequan by again turning the enemy's left. On the 22d the assault was delivered just before sunset. Crook, who had been all day moving toward and along Little North Mountain, under cover of the woods, till he had gained the Confederates' flank and rear, rushed across the intervening space, and before they could recover their surprise was over their intrenchments. The other divisions joined in with Crook and took up the charge. Sheridan and his staff were everywhere, shouting: "Go on; don't stop; go on." The whole Confederate line broke from the trenches, and Fisher's Hill was carried, with the additional Confederate loss of 6 guns and 1235 men, of whom 1000 were prisoners. Early fled in disorder, and Sheridan pushed after him the same evening as far as Woodstock. Early made a halt at Port Jackson, but, being attacked by Averell's cavalry on the 23d, he retreated across the North Fork to Reede's Hill near New Market, and thence to Brown's Gap, where he was rejoined by the cavalry of Lomax and Fitz Lee, as well as by Kershaw. Rosser joined a few days later. Here his retreat came to a close.

Sheridan, with his main force, followed as far as Harrisonburg. His cavalry he sent on under Torbert as far as Staunton and Waynesboro', with instructions to burn barns, forage, mills, and whatever might be serviceable to the Confederacy. This in-

struction was thoroughly carried out and the whole region, which, as far up as Staunton, had abounded in food and forage and enabled Early's army to subsist, became desolate.

But this very want of supplies in the upper valley, as well as Early's increased strength, determined Sheridan to retire down the valley, laying waste the region through which he passed so as to make it untenable by, and unprofitable to, the enemy. He writes from Woodstock, on Oct. 7th: "I have destroyed over 2000 barns and 70 mills filled with wheat and flour." He continued his devastating course down the valley, closely followed by the Confederate cavalry under Rosser, with the infantry farther in the rear. Skirmishing between Rosser and Torbert, covering the Union rear, was almost continuous. On Oct. 9th, as the head of the Union column of infantry was entering Strasburg, movements in the rear led Torbert to despatch Custer and Merritt to attack Rosser. The Confederate horsemen yielded to the onset, and a stampede ensued to 7 miles south of Fisher's Hill, their loss amounting to 330 men with eleven pieces of artillery. Torbert characterized this engagement—the battle of Tom's Run, as it was called—as, "among the long list of the cavalry's victories, the most brilliant one of them all." Sheridan then continued to fall back as far as Cedar Creek, fixing his camp on the left bank of the stream just above its junction with the North Fork. While in position here, on Oct. 19th, his force was suddenly attacked before daybreak, the enemy's advance being further concealed by a dense fog. Bewildered by the unexpectedness and vigor of the onset, the left flank of the Eighth Corps was turned and the whole army driven back for miles, with the loss of 24 pieces of artillery and not less than 1300 prisoners. And now occurred the most dramatic incident in the annals of the valley. Sheridan had been absent on business in Washington, and the morning of the 19th found him in Winchester on his return. An officer reported sounds of artillery. Mounting his horse, he rode through Winchester, and then the noise of guns put a battle beyond question, while within a half-mile of the town he met men and trains streaming from the field. Realizing the true condition of affairs, he dashed up the pike with an escort of 20 men, and on reaching the army, 11½ miles from Winchester, he was hailed "with a tempest of joy." "I hastened from Winchester," he writes to Grant at 10 P. M., "and found the armies between Middletown and Newtown, having been driven back four miles. I here took the affair in hand, and quickly united the corps—formed a compact line of battle just in time to repulse an attack of the enemy." At 4 o'clock Sheridan ordered an advance, and the whole Union line responded. His onset was irresistible. Division after division of the Confederates gave way, and the repulse became a rout than which none so complete had been seen since the day of Bull Run. The 24 guns lost in the morning were retaken, and 24 Confederate pieces captured. Ambulances, caissons, and a number of battle-flags were among the spoil, the only trophies retained by Early being 1429 prisoners whom he had despatched toward Richmond. But this victory, plucked, as it were, out of defeat, was purchased at a great price. The Union loss in killed, wounded, and missing summed up to no less than 5764. Early's loss was less—about 3100—of whom over 1000 were prisoners. The pursuit was kept up by the Union cavalry to Mount Jackson, about half-way between Edenburg and New Market.

Cedar Creek constituted the crown of Sheridan's campaign, for, with the exception of a few comparatively unimportant affairs, this closed operations for the year. Gen. Early's force took up a position farther up the valley, while Gen. Sheridan's army

was in detachments widely scattered. Congress a few months after the battle passed a resolution tendering its thanks to Sheridan and his troops for the gallantry, skill, and courage displayed in the brilliant series of victories achieved in the valley. The President also thanked him by letter, in the name of the nation, and a few weeks later appointed him a major-general in the army.

Throughout his campaign Sheridan had been much annoyed by the operations of the guerilla leader Mosby, whose headquarters were to the east of the Blue Ridge in Loudon county. Toward the end of November, by way of retaliation, he sent a division of cavalry into the county to "consume and destroy all forage and subsistence, burn all barns and mills and their contents, and drive off all stock." The commission was executed with ruthless severity.

With the coming of spring, movements in the valley were renewed. On Feb. 27, 1865, Sheridan moved up the river from Winchester at the head of 10,000 sabres, his orders being to destroy the Central Railroad and the James River Canal, capture Lynchburg, and then join Sherman or return to Winchester. Early was found posted on a ridge west of Waynesboro', with two brigades of infantry, a battalion of 6 guns, and Rosser's cavalry. The position was carried in an instant. All Early's wagons, stores, seventeen flags, and eleven guns (including five found in the town), with 1600 prisoners, fell into the victor's hands. Early and the other Confederate generals fled toward Richmond; Sheridan returned to Winchester.

The victory at Waynesboro' left him complete master of the valley. His lieutenants now set about the destruction of the Central Railroad and the canal. This accomplished, the Valley war was at an end. Early was with Lee, and on March 27th Sheridan joined Grant before Petersburg.

SHEPARD, CHARLES UPHAM (1804-1886), physicist, was born at Little Compton, R. I., June 29, 1804; graduated at Amherst College in 1824; studied botany and mineralogy at Harvard under Nuttall, and subsequently taught these branches at Boston. For two years he was Prof. Silliman's assistant in the laboratory of Yale College, and was for one year in charge of the Brewster Institute at New Haven for diffusing a knowledge of science through popular lectures. In the winter of 1832-33 he was employed on a government commission to investigate the culture of the sugar-cane and the manufacture of sugar in the Southern States, the results being embodied in Prof. Silliman's *Report to the Secretary of the Treasury* in 1835. From 1830 to 1847 he was lecturer on natural history at Yale, and was associated with Dr. J. G. Percival, in 1835, in the State geological survey of Connecticut. From 1845 to 1852 he was professor of chemistry and natural history at Amherst, and on the chair being divided in the latter year, was continued as lecturer on natural history till 1877, when he was made professor emeritus. From 1831 till the outbreak of war, in 1861 he filled the chemical chair in the college of Charleston, S. C., and in 1865 resumed its duties for a few years. To him is due the discovery of the rich deposits of phosphate of lime near Charleston, which have proved of great value as fertilizers. Prof. Shepard formed at Amherst the finest collection of meteorites and minerals in the country, which was purchased in 1877 by the college, but partially destroyed by fire in 1880. He was the author of a *Treatise on Mineralogy* (1832; 3d ed., 1855) and a *Report on the Geology of Connecticut* (1855), as well as of numerous papers, appearing chiefly in the "American Journal of Science." The degree of LL. D. was conferred on him by Amherst in 1857, and he was member of many scientific societies, home and foreign. He died at Charleston, S. C., May 1, 1886.

His son, CHARLES UPHAM SHEPARD, Jr., was born at New Haven, Oct. 4, 1842; was prepared for college at Phillips Academy, Andover, Mass.; graduated at Yale, 1863, and at Göttingen, in medicine, 1867. On his return to the United States he was appointed to the chair of chemistry in Charleston, S. C., which he held till 1883, since which time he has been engaged as an analytical chemist, largely in developing the chemical resources of South Carolina as relating to agriculture, first disclosed by his father. In 1887 he presented to Amherst a second cabinet of minerals left by his father, while his own cabinet of meteorites is deposited in the National Museum at Washington.

SHEPLEY, GEORGE FOSTER (1819-1878), judge and general, was born at Saco, Maine, Jan. 1, 1819. His father, ETHER SHEPLEY (1789-1877), had been prominent in the political affairs of Maine from its separation from Massachusetts, serving in the U. S. senate, 1833-36, and afterward in the State supreme court, of which he was chief justice from 1848 to 1855. The son graduated at Dartmouth College in 1837, studied law at Harvard, and began practice at Bangor. He removed to Portland in 1844, and was U. S. district attorney from 1853 to 1861. He had been delegate to the National Democratic Convention in 1860, but on the outbreak of the civil war he was commissioned colonel of the Twelfth Maine Volunteers, and took part in the expedition against New Orleans. In the capture of that city he led a brigade, and was afterward military commandant. His administration was characterized by judicious firmness, which preserved order amid turbulent elements. In June, 1862, his rule was extended over Louisiana; when a loyal civil government was established there, in 1864, and Gen. Butler's army went to Virginia, Gen. Shepley was transferred to the command of the military district of Eastern Virginia. On the capture of Richmond, he was appointed its military governor. He resigned from the army in July, 1865, and in 1869 was appointed U. S. circuit judge for Maine, which office he held till his death at Portland, July 20, 1878.

SHERIDAN, PHILIP HENRY (1831-1888), by military ability eminently deserved the high rank to which he attained—General in the United States Army, a rank previously held only by U. S. Grant and W. T. Sherman. In the last year of Sheridan's life a curious controversy arose as to the place of his birth. His mother settled the matter by stating that "Phil was born, March 6, 1831, in the little frame house still standing in South Street, Somerset, Perry Co., Ohio."

Philip was the second son of John and Mary Sheridan, who emigrated from County Cavan, Ireland, in 1828, and who, after residing a short time in Albany, drifted to the village of Somerset in 1829. Here the father found employment in road-making, bettering himself till he eventually was able to take contracts. Sheridan had two brothers, of whom the younger, Col. Michael V. Sheridan, was, in his later years, on his staff. Philip spent his boyhood working on the homestead and attending the village school, on leaving which he got situations in the village stores successively, each change bringing increased pay. The rollicking Irish boy is yet spoken of in Somerset as ever ready for a frolic or a fight, and yet without an enemy in the place. From his early years he was a lover of soldiers and used to organize the village boys into a company, over whom he was a strict disciplinarian but a good drill-master. He was fond of reading biography and history, especially histories of wars. The victories of Taylor and Scott in 1846-47 probably stimulated his military instincts, and a fortunate application to the congressman of the district gained him in his 17th year a cadetship

in West Point Military Academy, which institution he entered in 1848. Here, for the first six months, he had Henry W. Slocum (afterward major-general) as a room-mate, who helped him materially with his initiatory studies, especially in mathematics. Young Sheridan should have graduated in 1852, but an unfortunate quarrel with a fellow-cadet, who was an officer in the corps, as well as his general propensity for breaking rules, led to his suspension for a year. In 1853 he graduated No. 34 in a class of 52 members. Commissioned as brevet 2d lieutenant, he reported for duty at Newport barracks, Sept. 30, and was next year assigned to the First Infantry in Texas. In November, 1854, he received his commission as 2d lieutenant in the Fourth Infantry. With this regiment he served for six years in Washington Territory and Oregon, at the time when the encroachments of the gold-seekers had provoked the animosity of the Indians. Against these Sheridan was almost constantly engaged, for a time on detached duty in scouting, and this chiefly in command of a detachment of the First Dragoons. In April, 1856, the Indians attacked the blockhouse at the Cascades on the Columbia, W. T., when he at once embarked his dragoons and, after some fighting in conjunction with a few companies of the Ninth Infantry, drove the savages off. For gallantry in this affair he was complimented in orders and promoted to the command of the Indian Reservation. Recalled to the East in September, 1861, by the progress of the civil war, he expressed the modest wish that he "might get a captaincy out of the thing." His aspiration was gratified, June 18, when he received his commission as captain in the Thirteenth Infantry, of which regiment W. T. Sherman was colonel, and the promotion took him to St. Louis. There his first duty was presiding over a court for auditing claims. Next he was appointed quartermaster and commissary on the staff of Gen. S. B. Curtis, in command of the Army of the Southwest, then concentrating in Missouri. In this office he had not the fortune to satisfy his commanding officer and was, in consequence, sent to report to Gen. Halleck, who, after the battle of Shiloh, had taken the command in the advance on Corinth. On May 25, 1862, he was, on the recommendation of Halleck—who had served in California and knew that Sheridan had had command of dragoons—appointed to the colonelcy of the Second Michigan Cavalry, then lying near Corinth.

His active career now began. He led his regiment to Booneville, Miss., where, after taking part in several skirmishes, he was put in command of a brigade composed of his own regiment and the Second Iowa. In command of this he fought the brilliant battle of Booneville, July 1, 1862, for which he was commissioned brigadier-general of volunteers. In the following autumn Sheridan was transferred to the command of the Eleventh Division of the Army of the Ohio (afterward known as the Army of the Cumberland), under Buell, and on Oct. 8 took part in the battle of Perryville against Bragg, where he distinguished himself for resolution, discreet judgment, and ability in handling troops. The army now marched to the relief of Nashville, where its command was transferred to Rosecrans, under whom Sheridan first gave full evidence of his ability as a commander. On Dec. 26 he marched with Rosecrans from before Nashville to the desperate contested two days' fight of Stone River (*q. v.*). Here for three hours his division of McCook's corps held the key of the position, losing all its three brigade commanders killed, and seventy other officers and nearly half its men killed and wounded. His stubborn resistance on this day, coupled with that of Thomas with his gallant corps in the centre, enabled Rosecrans to form his new line of battle for next day. The fighting on the succeeding days

was less vigorous, and on the 3d Bragg withdrew, leaving Murfreesboro' to Rosecrans. For his gallantry here Sheridan was created a major-general of volunteers. Next came the Tullahoma campaign, in which Sheridan's division led the advance, with combats at Fairfield, Cowan Station, and University. This campaign was followed, a few months later, by Rosecrans' advance on Chattanooga and the disastrous battle of Chickamauga, Sept. 19 and 20. Here Sheridan's division suffered from a misunderstanding of orders, and became separated from the rest of the army, and, after desperate fighting, was driven from the field. Sheridan's chagrin at his repulse was brief. Thomas got command of the Army of the Cumberland, whose retreat to Chattanooga he had covered, and when Grant arrived with re-enforcements and undertook to dislodge Bragg, Sheridan's division formed the centre of the column which fought in the conflicts of Lookout Mountain and Missionary Ridge on Nov. 23, 24, and 25, and on the last day carried Missionary Ridge, pierced the Confederate lines, and finally won the fight. His men were the first to cross the crest and press the enemy's rear-guard till long after dark, capturing wagons and artillery. Sheridan continued in West Tennessee through the winter of 1863.

When Grant was called to the command of the Army of the Potomac, in March, 1864, he declared to Pres. Lincoln the urgent need for an energetic leader of cavalry. "I said," Grant reports, "I wanted the very best man in the army for that command. Halleck, who was present, spoke up, saying, 'How would Sheridan do?' I replied, 'The very man I want.'" Accordingly, on April 4, Sheridan took command of the cavalry corps of the Army of the Potomac, and his organizing power quickly brought the corps into the best fighting trim. In the battles of the Wilderness it covered the front and flanks of the infantry, and on May 8 Grant directed its commander to cut himself loose from the army, attack the enemy's cavalry, cut his communications and line of supplies, and sweep round Lee's force to Butler's position on the James at Haxall's Landing. The course he took was directly on Richmond, and involved, on the 10th, the destruction of the Confederate stores at Beaver Dam and recapture of 375 prisoners on their way to Libby prison; on the 11th, the hottest cavalry fight in the war, namely, that with Gen. J. E. B. Stuart at Yellow Tavern, in which the gallant Confederate leader fell; a dash on the defences of Richmond, with the forcing of the Chickahominy, and a fight at Meadow Bridge on the 12th. On the 14th he recrossed the Chickahominy and went into camp on the James, where he rested three days. "Sheridan," says Grant, "in this memorable raid passed entirely around Lee's army, encountered his cavalry in four engagements and defeated them in all, recaptured 400 Union prisoners, and killed and captured many of the enemy, destroyed and used many supplies and munitions of war, destroyed miles of railroad and telegraph, and freed us from annoyances by the cavalry of the enemy for more than two weeks."

Resuming the advance with Grant, Sheridan fought at Hawes' Store, May 28; Matadequin Creek, May 30; and at Cold Harbor, May 31 and June 1. On the 6th of June he was despatched to cut the Virginia Central Railroad near Charlottesville, and to escort the Shenandoah forces of Gen. Hunter to those of Grant. In marching to execute this, his advance was disputed on the 11th at Trevillian Station by Gen. Wade Hampton, whom, after severe conflict, he succeeded in repulsing. The march, however, had not been executed with Sheridan's usual vigor, and on the 12th, though within 30 miles of Charlottesville, he withdrew after breaking the

railroad at Trevillian, leaving the main object of the expedition unaccomplished.

Gen. Sheridan was now transferred to another scene of action, in which he was to win new fame as the leader of an independent command. Early had assumed a threatening attitude in the Shenandoah Valley, and on Aug. 7 Sheridan was put in command of the Middle Military Division, consisting of some 30,000 men, including 8000 cavalry. His career here has been described in the article *SHENANDOAH VALLEY* (q. v.). After engagements on the Opequan, at Fisher's Hill, and on Cedar Creek—at which last place Early had victory in his grasp, to be snatched from it and converted into a Union triumph by the famed "ride from Winchester" which made Sheridan a major-general in the regular army—he finally drove Early up the valley, and, after scattering the remnant of the Confederate forces at Waynesboro' and holding the valley for some months, he made his way to Grant's army at the White House on the Pamunkey, which he reached, March 19, 1865.

With Sheridan's cavalry at his disposal, Grant now began his final campaign. Sheridan crossed the Peninsula to the James and occupied Dinwiddie Court-house. Immediately on his arrival there Grant sent him word that, instead of raiding on railroads, he should "push round the enemy and get on his right rear." "I now feel," he added, "like ending the matter." So soon as Lee detected this purpose, he gathered up all available forces from his intrenched line and placed them under Pickett and Johnson, who on March 31 attacked Sheridan at Dinwiddie with a heavy infantry force. Next day, having been re-enforced by Warren's corps, he, by a masterly tactical movement, entrapped and completely routed Pickett and Johnson at Five Forks, capturing several thousand prisoners, 4 guns, with many colors. This overthrow of Lee's right, followed immediately by the carrying of all the outer line of intrenchments at Petersburg, made the evacuation of this place and the abandonment of Richmond imperative, Lee's only line of retreat being that of the Appomattox river. Next morning the blowing up of the Confederate iron-clads and the firing of the tobacco warehouses by Ewell's rearguard gave intimation to the Union troops of "the beginning of the end." Lee now began his retreat to Appomattox, Grant pursuing on the south of the river, with Sheridan on the van. On April 6 Sheridan, supported by the Second Corps, struck Ewell at Sailor's Creek, capturing 16 guns and 400 wagons, and detained him till the Sixth Corps came up, when a combined attack resulted in the capture of 6000 prisoners. This was the last serious fight in the war. On the 8th he captured four supply-trains at Appomattox Station, and at the Court-house the advance of Lee's army was resisted till dark. On the morning of the 9th the enemy endeavored to break through his dismounted cavalry, when, drawing aside, he disclosed the infantry behind. Mounting his men, Sheridan was about to charge, when the white flag was displayed, and the war in Virginia was at an end.

Sheridan was not permitted to participate in the pageant of march and review of the Union armies at Washington on May 30. Immediately on Lee's surrender he was despatched to a cavalry and infantry force to Sherman in North Carolina, but was recalled on Johnston's capitulation. He was next put in command of the forces west of the Mississippi, and despatched to Texas, where Kirby Smith was keeping up a show of resistance. Here Smith's surrender did away with the need of his services. In 1865 he was appointed to the command of the Military Division of the Gulf, embracing Florida, Mississippi, Louisiana, and Texas, with headquarters at New Orleans, with command of a corps of ob-

servation on the Rio Grande to watch the war in Mexico.

In his *Personal Memoirs* Sheridan asserts that, going beyond the letter of his instructions and perhaps even beyond their spirit, he made such demonstrations of hostility against the Austrian Archduke Maximilian, whom the French emperor was thrusting upon a reluctant people, as compelled the withdrawal of Marshal Bazaine. The dismal tragedy of Querétaro, on June 19, 1867, brought to a terrible end the vain dream of the European adventurers. Sheridan returned to New Orleans to take up the task of supervising and directing the reconstruction of civil government among a people still infected with rebellious notions. The President and Congress were at hopeless feud over the methods of restoring civil order. Though the former was his military superior, Sheridan's love of the Union for which he had dared and wrought so much made him instinctively recoil from aiding to restore power to those who had sought to divide the nation. He therefore obeyed the directions of Congress, and ruled with a rigid hand. He removed from their offices the mayor of New Orleans, the governor of Louisiana, and the governor of Texas. Finally, in August, 1867, Pres. Johnson, finding his policy thwarted by his subordinate, removed Sheridan from the command of the Fifth Military District, and transferred him to the Department of the Missouri, with headquarters at Leavenworth. Here Sheridan was brought into contact with another problem of government, of which he had had some experience at the outset of his military career—the Indian question. He solved it in the way which has commended itself to the judgment of most military men—by insisting on the complete submission of the Indians. The tribes on the plains had been left much to themselves during the long civil war, and were greatly disturbed by the rapid westward movement of white adventurers at its close. Conflicts were frequent, and both parties were in the wrong. But Sheridan, after a year's experience, determined on the most effective course to settle the troubles. In October, 1868, calling to his aid the gallant cavalry general, George A. Custer, he sent him against the villages of the Cheyennes and other tribes on the Washita. There, on Nov. 27, Custer, with the Seventh Cavalry, amid a heavy snow-storm which impeded the movement of the Indians, almost totally annihilated their bands. This expedition, though sternly denounced by many, put a stop to the Indian troubles for a time.

Sheridan continued in command at Leavenworth till, on Grant's inauguration, March 4, 1869, he was promoted to lieutenant-general, and given command of the Division of the Missouri, with headquarters at Chicago. During the Franco-Prussian war Sheridan visited Europe and was received with high distinction by King William, witnessing several battles, including Gravelotte and Sedan. In Chicago, in 1874, he was married to Miss Jane Rucker, daughter of Maj. Gen. Rucker, who had just left her convent-school in Philadelphia. During the political disturbances in Louisiana, in 1875, Sheridan was ordered to New Orleans, where he exhibited the same courage and prompt decision which characterized his whole career. On quiet being restored he returned to his command at Chicago.

On Nov. 1, 1883, Gen. Sherman was, by his own request, relieved of the command of the Army of the United States, and General Sheridan, being appointed to succeed him, removed to a home in Washington purchased for him by Chicago friends. In May, 1888, Congress passed a bill reviving the rank of General, thus enabling the President to confer this rank on him, which was forthwith done.

Already in that month the illness, heart-failure,

which was to carry him off, showed itself on his return home from a tour of inspection in the West. In the end of June, to evade the intense heat of Washington, he embarked on the U. S. steamer Swatara, and was by it conveyed to Nonquit, Mass. Here he died, Aug. 5, 1888, leaving a widow and four children. His remains were brought back to Washington, and, on Aug. 9, interred in the National Cemetery of Arlington, "under the shadow of the home of the Lees," with the solemn ritual of the Catholic Church, of which he was a member, and with every manifestation of public respect.

Of Sheridan, almost more than of any general in the war, it may truthfully be said that he was "a born soldier." His aptitudes were all essentially military. He was daring, enterprising, self-reliant, prompt, resourceful, and no man was more highly gifted with the faculty of inspiring his men with an enthusiasm akin to his own. The affection with which they regarded him found expression in the sort of pet name by which they spoke of him—"Little Phil." Yet no man could be more stern on occasion, and none was more stringent in enforcing discipline. With all his Irish ardor of heart, he never omitted to provide for emergencies, nor ever entered into an engagement without looking out for means for securing a retreat. His tactical ability was evidenced by the high state of efficiency to which he brought every body of troops intrusted to him; and the independent engagements he fought, and especially his conduct of the campaign in the Shenandoah Valley, abundantly testify to his skill and ability as a general. "As a soldier," Grant said of him, "there is no man living greater than Sheridan. He belongs to the very first rank of captains, not only of our army but of the world. I rank him with Napoleon and Frederick, and the great commanders of history."

Toward the close of his life Sheridan, following the example of his chief, spent much time in preparing his *Personal Memoirs*, which appeared in November, 1888. They are marked in a striking degree with the same characteristics as Grant's *Memoirs*—straightforward simplicity and terseness of thought and style, entire freedom from vanity or envy, just appreciation of the merits of others, and intense love of his country and its institutions.

(J. H.)

SHERIFF. A county officer, representing the executive or administrative power of

the state within his county. In England the sheriff was formerly elected by the inhabitants of the county, except in some counties where the office was hereditary, and in Middlesex, where the office is vested in the City of London by charter. Since the statute of 22 and 23 Vict., c. 21, § 42, the sheriffs are nominated by the Lord Chancellor and judges of the courts at Westminster, and appointed by the Crown. In the United States they are usually elected for a term of three years, subject, however, to removal by the governor of the State for cause. Like other officers of the States, they are required to give bonds to the commonwealth conditioned for the faithful performance of their duties, without fraud, deceit, or oppression. The sheriff must preserve the peace of the county, and in so doing may apprehend and commit to prison all persons breaking the peace, or may bind them over to keep the peace; he must pursue and take all murderers, felons, and rioters; must keep the county jail, and defend it against rioters. To all these ends he may summon the inhabitants of the county, or *posse comitatus*, to his assistance; all persons over fifteen years of age are bound to answer this summons under pain of fine and imprisonment. He is bound to execute, within his county, all civil process issuing from the courts,

such as serving of writs, etc.; should he be a party to the proceeding, the coroner acts as his substitute; he also summons the jury which tries the cause, and executes the judgment of the court. In criminal cases, also, he arrests and holds the accused, summons the jury, and executes the sentence imposed by the court. He has power, generally prescribed by statute in the several States, to summon juries for special purposes, such as the execution of writs of damages, or of partition of lands, etc., referred to him by the courts.

His authority is confined to his own county, though when commanded by a writ of *habeas corpus* he may convey a prisoner out of his county; a prisoner who has escaped from his custody may also be pursued by him into another county and retaken there; he may also perform merely ministerial acts in another county of his State, e.g., making out a jury panel or assigning a bail bond, etc.

He may appoint deputies to assist him in the performance of his duties, and is responsible for their acts in so doing. They may perform all ministerial duties, such as the service and return of writs, etc., but any quasi-judicial duty, such as the execution of a writ of inquiry, cannot be performed by deputy. The sheriff is generally the custodian of the county jail, and is responsible for escapes therefrom; he is bound to have a sufficient force at hand to protect it from attacks by mobs, etc.

Civil process, writs, etc., are, as a general thing, served by his deputies, though it is not absolutely necessary that they should be, if the deputy is present. In serving civil process, he may not break into a man's house, though in the execution of criminal process he may, after demanding admittance. Process of any description may not be served on Sunday, except in cases of treason, felony, or breach of the peace; nor may he on that day retake a prisoner who has escaped. (T. R.)

SHERMAN, a city of Texas, county seat of Grayson Co., is on the Houston and Texas, the Texas Pacific, and the St. Louis, Arkansas and Texas Railroads, 65 miles north of Dallas. It has a fine court-house (costing \$85,000), a jail (costing \$95,000), a fine opera-house, and two large hotels. There are 2 banks, 2 daily and 3 weekly newspapers, 9 churches, 7 schools, some of which have fine buildings. There are 2 iron foundries, 4 planing-mills, and some small factories. The buildings are chiefly of brick. The city has water-works, and a park, and is lighted with gas and electric light. It was settled in 1846 and incorporated in 1853, and its prosperity has been increased by the railroads, which transport hence grain and cotton. The population in 1880 was 6093, and it is now estimated at 10,000.

SHERMAN, JOHN, statesman and financier, was born, May 10, 1823, at Lancaster, Ohio, being the eighth child of the Hon. Charles R. Sherman, judge of the Supreme Court of Ohio, who in 1810 had married Miss Mary Hoyt, of Norwalk, Conn. When John was but six years old his father died, leaving his widow with eleven children in straitened circumstances. In boyhood John was adopted by a relative of the same name living at Mount Vernon, Ohio. Here the boy received an education which he himself characterized as "the foundation-training of his life." At the age of 12 a sister took charge of him, and placed him at an excellent school in Lancaster, which he left in 1837, reasonably prepared to enter the sophomore class in college. Circumstances did not permit his carrying out this plan and after serving as a rodman in the corps of engineers engaged on the Muskingum and as superintendent of the section of the work at Beverly (whence he was removed in 1839 on account of his being a Whig), he entered the law-office of his brother, the Hon. C. T. Sherman, at Mansfield, who took him, after four

years' study and practice of law, as a partner. Here he practised for ten years, acting as attorney for all the railroads centring in Mansfield. In 1848 he married the daughter of the Hon. James Stewart, of that city, and in the same year attended the Whig convention at Philadelphia that nominated Gen. Zachary Taylor for President. In 1852 he was delegate to the Baltimore convention that nominated Winfield Scott. In 1855 mainly in consequence of his attitude on the Missouri Compromise question, he was elected to the 34th Congress in the interest of the Free Soil party. Here his familiarity with affairs and readiness in debate made him a power both on the floor and in committees. He was re-elected to the 35th Congress, and here, as in the 34th, he took a leading part in questions affecting finance, the extension of slavery to Kansas, the navy-yard abuses, etc., so that at the end of his second term he was recognized as the foremost man in the House. In 1858 he was re-elected to the 36th Congress, and in 1859 was made Republican candidate for Speaker, but yielded, after 8 weeks' balloting, to Mr. Pennington. He was then made chairman of the ways and means committee, where his zeal in the cause of the unity of the country and of sound finance, as well as against the spread of slavery, brought him into collision with Pres. Buchanan. In 1860 he was again chosen to Congress, but on the resignation of Senator Chase he was elected to his place, and took his seat in the Senate in 1861, being acknowledged as a leader from the first. On the fall of Fort Sumter he tendered his services to Gen. Patterson, and remained as his aide-de-camp, with the Ohio regiments, till Congress met in July. On the close of the extra session he raised a brigade of 2300 men, largely at his own expense, which was known during the war as the "Sherman Brigade." During the war he was mainly engaged on questions of finance, his speeches on State and National banks being the most important, while he powerfully aided the Union by steadily contributing to supply the means for continuing the struggle. After its close, Thaddeus Stevens and Sherman were the authors of the bill for the reconstruction of the Southern States which Congress enacted in the winter, 1866-67. In the latter year he introduced a refunding act, which was adopted in 1870, without the resumption clause. In 1874 he was chairman of a committee of nine, appointed by a Republican caucus, that agreed upon a bill for the resumption of specie payment on Jan. 1, 1879. In March, 1877, Senator Sherman was appointed by Pres. Hayes secretary of the treasury, and six months before the date fixed for resumption he had accumulated \$140,000,000 in gold, and saw the legal-tender notes so rival gold in value that on the day fixed for resumption there was no demand for gold in exchange for them. In 1880 he was a candidate for the presidential nomination, his vote ranging from 90 to 97, when his supporters combined with those of Blaine to nominate Garfield. In 1881 he returned to the Senate, and was re-elected in 1887, and served as chairman of committees on foreign relations, finance, expenditure, and rules. In 1888 his name was presented to the Chicago Convention as a presidential candidate, and he continued to be the leading nominee until the last day, when Gen. Harrison was nominated.

Without being a great orator, John Sherman is largely indebted for the eminent position which he has attained to his conscientious mastery of every matter with which he undertakes to deal, and to the power of lucid statement which such a mastery enables a man of vigorous, clear, and well-ordered mind to attain. Among the services rendered by him to his country may be enumerated: The reform of the abuses in New York custom-house and

in the National navy-yards, the resumption of specie payment, and the funding of the public debt. His whole career in Congress was conspicuous for scrupulous care for the public credit, and the economy of its funds. See Rev. S. A. Bronson's *John Sherman: What he has Said and Done* (1880). In 1879 Mr. Sherman himself published his *Selected Speeches and Reports on Finance and Taxation, 1859-1878*.

SHERMAN, ROGER (1721-1793), a signer of the Declaration of Independence, was born at Newton, Mass., April 19, 1721, and taken to Stonington, Conn., two years later: his great-grandfather had settled at Watertown, Mass., about 1635. With little early education, he eagerly sought knowledge, and managed to overcome great disadvantages. He is said to have kept an open book before his shoemaker's bench for the utilization of spare moments. At nineteen he was obliged to take his father's place, and become the chief support of a large family. At twenty-two they removed on foot to New Milford, where he exchanged his trade for business enterprises. His industry, ability, and integrity won a rapid and steady rise from his humble condition. Having been early attentive to mathematics, he became county surveyor in 1745, and in 1748 began to furnish the astronomical calculations for a New York almanac. He studied law in his leisure hours, was admitted to the bar, 1754, and the next year was made justice of the peace and sent to the Connecticut assembly. In 1759 he was appointed judge of the Litchfield county court. Removing to New Haven in 1761, he became a county judge in 1765, treasurer of Yale College the same year, and in the next an assistant or member of the Upper house. This post he held till 1785, and that of judge of the superior court, 1766-89. His character and position made him a leader in the struggle for liberty. Sent to the Continental Congress in August, 1774, he was a member of many important committees, including that which drafted the Declaration. He was no orator, but his business ability, good sense, uprightness, and solidity made him respected and useful, and his congressional career lasted to the end of his life. During the war he was active on the Connecticut committee of safety, and in 1783, with Judge Richard Law, revised the State statutes. He was mayor of New Haven from 1784 to his death. As a member of the constitutional convention of 1787 he rendered very important services, taking a prominent part in the debates, and offering suggestions which were incorporated in the document. He expounded and enforced the Constitution in papers signed "Citizen," and urged its ratification in the Connecticut convention assembled for that purpose, of which he was a leading member. In Congress, February, 1790, he supported an address presented by Quakers against the African slave trade, and secured its reference to a committee. He was elected to the U. S. Senate, 1791, and died at New Haven, July 23, 1793. Macon credited him with supreme common-sense, and Jefferson declared that he "never said a foolish thing." Senators G. F. Hoar and W. M. Evarts are descended from him.

SHERMAN, THOMAS WEST (1813-1879), general, was born at Newport, Rhode Island, March 26, 1813. In 1836 he graduated at West Point Military Academy, and was appointed to the Third Artillery, with which he served in Florida till 1842, having been appointed 1st lieutenant in March, 1838. He was then assigned to recruiting and garrison service till 1846, when he was engaged as captain in the Mexican war, and for "gallant and meritorious conduct at Buena Vista" was brevetted major, Feb. 23, 1847. From 1848 till 1861 he was again on garrison and frontier duty, being specially employed in quelling the Kansas border disturbances, and in the com-

mand of an expedition to Kettle Lake, Dakota. On the outbreak of the civil war, in 1861, he was promoted to major, and to lieutenant-colonel of the Fifth Artillery, May 14, and to brigadier-general of volunteers, May 17. Till the end of June he was chief of light artillery in the defence of Washington. His next employment was organizing an expedition for holding Bull's Bay, S. C., and Fernandina, Florida, for the use of the fleet blockading the southern coast, when he was assigned to the command of the land forces in the Port Royal expedition. With a division of the Army of the Tennessee he took part in the siege of Corinth, Miss., and commanded a division in the Department of the Gulf till May, 1863, when he joined the expedition to Port Hudson, La., where he commanded the left wing of the besieging force. Here, while heading an assault on May 27, he lost his leg and was invalided till February, 1864, but in the meantime was made colonel of the Third Artillery, June, 1863. He served afterward in the command of a brigade in the Department of the Gulf, and in the southern and eastern districts of Louisiana. He was in 1865 brevetted brigadier-general U. S. army, and major-general for "gallant and meritorious services during the war." Subsequent to the war he commanded the Third Artillery at Fort Adams, at Newport, and the post of Key West, Florida. In December, 1870, he was retired from active service for disability, and died, March 13, 1879.

SHERMAN, WILLIAM TECUMSEH, the general whose operations, more than those of any other save Gen. Grant, contributed to bring the American war for the Union to a successful issue, was born in Lancaster, Ohio, Feb. 8, 1820. He is the son of Judge Charles R. Sherman, of the Supreme Court of Ohio, and brother of Hon. John Sherman (*q. v.*). Judge Sherman's fancy was captivated by the famous Shawnee chief, Tecumseh, for he insisted on giving this name to his second son, and on this being overruled by the mother, he engrafted it into that of his third son, William Tecumseh. The father died in 1829, leaving his family in poor circumstances, and William was brought up in that of the Hon. Thomas Ewing, of Lancaster, till his 16th year, receiving his education in Lancaster Academy, where he studied French, Latin, and Greek. In 1836 he entered West Point Military Academy, where he graduated, June 30, 1840, sixth in a class of 43. "At the academy," says Sherman himself, "I was not considered a good soldier, for at no time was I selected for any office, but remained a private throughout the whole four years." He was commissioned 2d lieutenant of the Third Artillery, and served in Florida against the Seminole Indians through the winters of 1840-41. In November, 1841, he was promoted to 1st lieutenant, and was shortly thereafter stationed at Fort Moultrie, S. C., where he remained for five years, having, among others, Bragg and Keyes for companions till the Mexican war. In 1846 he was sent to California, where he found a companion in H. W. Halleck, and remained through the war as acting assistant adjutant-general till 1850, having in the meantime obtained, for meritorious services, a brevet of captain in the regular army, dated May, 1848. In 1850 he returned East, with despatches to Gen. Scott in New York, and, having obtained leave of absence, visited his mother in Lancaster, and was married, on May 1, to Ellen Boyle, daughter of his benefactor, the Hon. Thomas Ewing, then secretary of the interior. In 1851 he took up his residence as commissary of subsistence in St. Louis, where his father-in-law had a property, rendered valuable by being included in the city survey, and where he himself made some purchases, which he still retains. In 1852 he moved in the same capacity to New Orleans. Finding his pay inadequate to support his family, he

resigned his commission in September, 1853, and accepted the position of managing partner of the branch of the banking house of Lucas, Turner & Co., then opened in San Francisco. The disordered condition of that city in 1855-56 tended to paralyse business, and Sherman took active part in the Vigilance Committee. After spending some time in New York, and subsequently in San Francisco, in winding up the business, he returned to his family in Lancaster. As a means of living he in 1858 entered a law firm in Leavenworth, Kansas, but, as the business was not sufficiently profitable, he made application in June, 1859, to the War Department for occupation, and was appointed superintendent of the Louisiana Military Academy. In 1861 Louisiana seceded from the Union, and Sherman threw up his office and returned to St. Louis, where he accepted the presidency of a street railroad.

On the capture of Fort Sumter Sherman offered his services to the government. These were accepted and, June, 1861, he was appointed colonel of the 13th Infantry. In the disastrous battle of Bull Run Col. Sherman commanded the third brigade in Tyler's division, and the vigor with which he fought his four regiments and battery is demonstrated by their loss—namely, 609—the total for the whole army being computed at only 1590. The Ohio delegation in Congress urged Sherman's promotion for gallantry, and, Aug. 3, he was made brigadier-general of volunteers.

When Gen. Robert Anderson, late commander of Fort Sumter, was assigned to the Department of the Cumberland, Gen. Sherman was attached as his second in command, and was soon thereafter despatched to occupy Muldraugh's Hill, south of Salt River. Here his "home guards" deserted him, and he found himself, with barely 5000 men, confronting Breckenridge with 25,000. When Anderson was relieved Sherman was appointed to succeed him. His position was far from enviable. Most of the young men of Kentucky had joined the Secessionists, and the non-combatants were usually unfriendly. He earnestly demanded re-enforcements, and in a personal interview with Secretary Cameron at Lexington, in presence of Gen. Thomas, explained the exigencies of the situation. On Nov. 3 he telegraphed to Gen. McClellan: "Our forces are too small to do good, and too large to be sacrificed." All representations proving vain, he asked to be relieved; Gen. Buell was appointed to succeed him, and at once re-enforced. Gen. Sherman, for his importunity, was set down as "crazy," especially for having stated to the secretary of war: "That to make a successful advance against the enemy, then strongly posted at all strategic points from the Mississippi to Cumberland Gap, would require an army of 200,000 men;" and this charge clung to him till events justified his view. In the meantime he was relegated to the command of a recruiting rendezvous at Benton Barracks, near St. Louis.

But Halleck now succeeded to the Department of the West, and Sherman was ordered to Paducah, with the charge of forwarding re-enforcements and supplies to Grant, who was moving on Fort Donelson. After the capture of this stronghold, Sherman was put in command of the Fifth Division of Grant's army at Pittsburg Landing. In the battle of Shiloh (*q. v.*) Sherman's division held the key of the position around the little church, and his conduct during all the fiercely contested conflict proved him to be possessed of genius of a high order. His division—consisting of 12 regiments infantry and 4 batteries—lost 2034 men. Gen. Halleck, who took the command-in-chief immediately after the battle, reported: "It is the unanimous opinion that Brig.-Gen. Sherman saved the fortunes of the day; he was in the thickest of the fight, had three horses killed under

him, and was twice wounded." Gen. Nelson said: "During eight hours the fate of the army depended on the life of one man. If Gen. Sherman had fallen, the army would have been captured or destroyed." And Grant himself said: "Sherman, with raw troops, held the key-point to the Landing; to his individual efforts I am indebted for the success of the battle." Of his achievements in the subsequent pursuit and advance on Corinth, Grant writes: "His services as division-commander in the advance on Corinth, I will venture to say, were appreciated by the new general-in-chief beyond those of any division-officer." For his services at Shiloh Sherman was appointed major-general of volunteers, to date from May 1, 1862.

In December, 1862, commenced that series of operations which culminated in the capture of Vicksburg. Sherman having been assigned to the command of the Fifteenth Corps, he embarked at Memphis on Dec. 20. The plan of operations was for Sherman to advance directly on Vicksburg and assault it, while Grant should follow and move on Jackson by railroad, engaging and holding the enemy's force there. Just as Sherman started, Holly Springs was attacked and surrendered, with the supplies on which the expedition partly depended; Grant was brought to a halt, and the enemy on his front hastened to re-enforce Vicksburg. Sherman, ignorant of the conditions, hurried on to play his part, and, disembarking at the mouth of the Yazoo, made, on Dec. 27, a general advance on the city, and carried the outer defences. For two days the attacks were renewed, but Vicksburg was impregnable to so small a force. Under a flag of truce Sherman buried his dead and cared for his wounded, and then re-embarked. At this juncture Gen. McClernand arrived, and superseded Sherman in the command of the right wing, which the latter announced to his men in a proclamation closing: "All good officers and soldiers will give the new commander the same hearty support and cheerful obedience they have given me. There are honors enough in reserve for all, and work enough too." The work was not long delayed. Seven days later Sherman, with the Fifteenth, and McClernand, with the Thirteenth Corps, stormed Arkansas Post, capturing 7000 prisoners, with guns and supplies. Of this achievement Grant says: "The conception was Gen. Sherman's; his part of the execution was as good as it could have been."

In March Admiral Porter made an attempt to reach the city by the intricate and artificially impeded navigation of the bayous and creeks leading into the Yazoo, and was entrapped and would have been captured but for Sherman hurrying to his relief and cutting him out. In the successive assaults till the city surrendered, on July 4th, to a regular siege, Sherman's corps bore its full part. Even after the capture its labors were not at an end. A fortnight before the surrender, Gen. Jos. E. Johnston threatened the rear of the besieging army with a large improvised force. Sherman was commissioned to deal with him, and on his approach Johnston withdrew to Jackson, Miss. This town was invested, and captured by Sherman, July 13, Johnston having evacuated it. Of Sherman's whole conduct before Vicksburg, Grant says: "The siege of Vicksburg and last capture of Jackson and dispersion of Johnston's army entitle Gen. Sherman to more credit than usually falls to the lot of one man."

After some weeks' rest for him and his men he received, on Sept. 22, a telegram from Grant calling on him to hasten to the help of Rosecrans, who had been defeated at Chickamauga. On the 23d he started with his corps, and, despite difficulties all but insurmountable and the constant opposition of the enemy, arrived on Nov. 15, where he

found Grant, now in command of the department and of the Armies of the Ohio, Cumberland, and Tennessee. Sherman was put in command of the last, and ordered to effect a lodgement on Missionary Ridge, which was held by Bragg, who was besieging Chattanooga. By incessant labor, night and day, Sherman got his army ready for action on the 23d, and, despite the position of the enemy on steeply naturally and artificially so unassailable that Bragg, deeming himself secure, had despatched Longstreet to besiege Burnside in Knoxville, the bloody ridge was carried on the 25th, and the Secession army flung back into the valleys of Georgia. Pursuit followed victory. All three armies pressed onward—Hooker and Thomas sharing with Sherman in the marching and fighting—till the Confederate army was driven out of Tennessee, when Sherman returned to Chattanooga. No sooner had he arrived than Grant ordered him to the relief of Burnside, beleaguered with 12,000 men, 84 miles off. Sherman instantly set out, but, on his approach to Knoxville, Longstreet raised the siege.

Sherman with his wearied men once more returned to Chattanooga, after a three months' campaign unparalleled in the war. His official report summarized his work as follows: "The men had marched for long periods, without regular rations or supplies of any kind, through mud and over rocks, sometimes barefooted, and without a murmur. Without a moment's rest after a march of over 400 miles, without sleep for three successive nights, they crossed the Tennessee river, fought their part in the battle of Chattanooga, pursued the enemy out of Tennessee, then turned more than 100 miles north, and compelled Longstreet to raise the siege of Knoxville, which had been the source of anxiety to the whole country."

Sherman now returned to Vicksburg, and at the close of January, 1864, organized a raid into Central Mississippi, setting out, Feb. 3d, and reaching Meridian, where he waited for General Smith to join him with 8000 cavalry. But Smith did not come. Instead of starting on Feb. 1, he did not move till the 11th, and the object of the expedition was foiled. After capturing large quantities of stores and damaging this hostile region, Sherman returned to Vicksburg. On March 12, 1864, Grant was put at the head of all the forces of the Union. The same order gave Sherman command of the Department of the Mississippi, and of the Armies of the Ohio, the Cumberland, and the Tennessee, under Schofield, Thomas, and McPherson, respectively. Soon the two parallel campaigns, with Richmond and Atlanta as their immediate objective, were set on foot. On April 10, 1864, the headquarters of Sherman's three armies were at Chattanooga, Huntsville, and Knoxville, and all were to be directed against Gen. Jos. E. Johnston, then lying intrenched at Dalton, Georgia. "Neither Atlanta, Augusta, nor Savannah," says Sherman himself in his *Memoirs*, "was the objective, but the 'Army of Joe Johnston,' go where it might."

On May 5 the general movement commenced, concentrating on Dalton, whence, on Sherman's advance, Johnston retreated—Parthian-like, striking as he retired. The fighting thereafter may be said to have been continuous, Johnston impeding the march at almost every step through a country broken, densely wooded, and entangled with brush, and by roads or tracks (where such were found) of the most miserable description, which became in wet weather—and it was often such—mere quagmires. Engagements took place at New Hope Church, Kenesaw Mountain (the hardest fight in the campaign, involving a Union loss of 2500 men), and Marietta, about which two places it was really a continuous battle from June 10 till July 3, when the enemy fell back

to Chattahoochee river. July 4 was celebrated by a battle of Thomas at Smyrna; on the 17th the Chattahoochee was crossed, and on the next day Sherman learned that Johnston had relinquished his command and Hood assumed his place. On the 20th came the battle of Peach Tree Creek, and on the 22d the battle before Atlanta, when the gallant Gen. McPherson was killed. On Aug. 12 Sherman learned that he was commissioned a major-general in the regular army, and heard of Farragut's success in entering Mobile Bay, which he regarded as a valuable auxiliary for future operations. On Sept. 1 Hood evacuated Atlanta, which was forthwith taken possession of by the Union troops. Here Sherman received the thanks of the nation communicated to him in a letter from the President, as well as warm complimentary letters from Grant and Halleck. The total loss of the Union Army for the campaign, from May 6 to Sept. 15—that is, on the march from Chattanooga to Atlanta—amounted to 31,687 killed, wounded, and missing; the loss of the Confederates was 34,979. By order of Gen. Sherman the civil population of Atlanta were required to leave the city, and this was in a great measure carried out by the exodus of large numbers to Hood at Rough and Ready—whence they were conveyed to their destinations southward.

In the beginning of October Hood began a movement westward, thus removing himself from Sherman's front. This movement was soon converted into a northerly one, Hood's object being to draw Sherman back from Georgia by assailing his line of communications and threatening Tennessee and Kentucky. The device was unavailing. Sherman, on satisfying himself of Hood's purpose, thought it sufficient to send Thomas back to Nashville to defend the line of the Tennessee and check Hood from troubling his rear, and himself prepared for his southward march to the sea. On Nov. 16 the movement began, his army numbering 62,000 men, with Maj. Gen. O. O. Howard in command of the right wing and Maj. Gen. H. W. Slocum of the left. The immediate objective point was Savannah, but the ulterior point was Grant's army before Richmond. Hood's withdrawal had left the way open to Sherman. On Dec. 13 Fort McAllister, at the mouth of the Ogeechee river, was captured, and Savannah invested by sea and land. Gen. J. B. Hardee, who occupied the city, evacuated it on Dec. 21, and next day it was formally occupied by the Union troops and the "March to the Sea" accomplished.

Savannah was now made the Union base, and preparations were made for an advance through the Carolinas to Richmond. On Feb. 1, 1865, the movement began and was continued without noticeable incident to Columbia. This beautiful town, taking fire from some burning cotton, was more than half reduced to ashes. Sherman was in no way responsible for the fact, though the citizens laid the blame on him. Hardee evacuated Charleston, Feb. 18. Sherman, on March 21 had a sharp action at Bentonville, N. C., with Gen. Johnston commanding the Confederates, resulting in the retreat of the latter with a loss of 2343, the Union loss being 1604. When at Smithfield, on April 11, in pursuit of Gen. Johnston, who had retreated on Raleigh, Gen. Sherman received news of Lee's surrender on the 9th at Appomattox Court-house.

A truce was at once arranged between Gens. Sherman and Johnston, and a convention agreed to in regard to the terms of peace. This convention, however, being political as well as military, required the assent of the government. Meantime Pres. Lincoln was assassinated, and Pres. Johnson and his cabinet, thinking that Sherman had exceeded his authority, peremptorily countermanded his action. Gen. Grant quietly visited Gen. Sherman, and then the

latter granted to Johnston the same terms that had been granted to Gen. Lee. Johnston surrendered on April 26 at Durham's Station, N. C., and the brilliant campaign, as well as the war, was at an end. On May 23, at Washington, Gen. Sherman witnessed the review of the Army of the Potomac under Gen. Meade, and on the 24th his own army was similarly reviewed. "It was," says Sherman in his *Memoirs*, "in my judgment the most magnificent army in existence—65,000 men in splendid physique who had just completed a march of nearly 2000 miles in a hostile country."

Gen. Sherman on leaving Washington returned to his native place in Ohio, where he rested for a time in the bosom of his family. On the partition of the whole country into five military divisions he was appointed to the command of the second, or that of the Mississippi (afterward the Missouri), with headquarters at St. Louis. Under the act of Congress, July 28, 1866, Grant was made general, and Sherman succeeded him as lieutenant-general, in the regular army. In October he was ordered to escort the newly appointed U. S. minister to Juarez, recently elected President of Mexico, as a significant protest against the occupation of that country by the Emperor Maximilian and French troops. Nov. 10, he embarked with the minister for Vera Cruz, and, after considerable search for the headquarters of the patriots, having, as he thought, put him *en rapport* with Juarez, returned to his duties in St. Louis. In January, 1868, Sherman was president of a board to compile a code of Articles of War and Army Regulations, the other members being Gens. Sheridan and Anger. On Grant's inauguration as President in March, 1869, Sherman was appointed general of the Army of the United States. This office he held till he reached the age prescribed by law for the retirement of army officers. He was relieved, at his own request, Nov. 1, 1883, and was succeeded by Gen. P. H. Sheridan (*q. v.*). He then took up his residence in St. Louis, but afterward removed to New York City.

Gen. Sherman's qualities as a soldier have been thus tersely summed up by one well competent to judge. "Above all his other excellences shone his promptitude, celerity, and immeasurable activity. What for some commanders were winter-quarters were to him a bivouac. Always ready for the start, indefatigable on the march, omnipresent in battle, relentless in pursuit, Gen. Sherman made himself not only more feared but more respected by the enemy than any general in the national armies save, perhaps, the one who commanded them all."

(J. H.)

SHIELDS, CHARLES WOODRUFF, Presbyterian divine, was born at New Albany, Ind., April 4, 1825. He graduated at Princeton in 1844 and studied theology there. After a brief pastorate at Hempstead, L. I., he became pastor in Philadelphia in 1850, where he remained until, in 1865, he was made professor in Princeton College. His department was the relation of religion to science, and to this was afterward added modern history. He has been an advocate of liturgical worship and of the union of Christian churches. He published *Philosophia Ultima* (1861), and several works, historical and critical, on Presbyterian liturgies.

SHIELDS, JAMES (1810-1879), general, was born in 1810 in Dungannon, County Tyrone, Ireland, and came to this country when 16 years old. In 1832 he settled at Kaskaskia, Ill., and began practice as a lawyer; and was elected, in close succession, member of the legislature, auditor, and, in 1843, judge of the supreme court. In 1845 he was made commissioner of the U. S. land office. When war was begun with Mexico he was appointed a brigadier-general and given command of the Illinois contingent; was shot through the body at Cerro Gordo, and

won the brevet of major-general. He took part in the operations in the Valley of Mexico, and was again severely wounded at Chapultepec. Mustered out in 1848, he was offered the governorship of Oregon Territory, but declined it on being elected U. S. Senator from Illinois. After serving from 1849 till 1855 he removed to Minnesota, and, on its being constituted into a State, returned to the senate as its representative. In 1860 he settled in California. On the outbreak of the civil war he was nominated brigadier-general of volunteers, and in 1862 commanded at the battles of Winchester and Port Republic, in the Shenandoah Valley. Resigning his commission in 1863, he settled first in California, but soon after at Carrollton, Mo., where he resumed his law-practice. He was also a member of the State legislature in 1874 and in 1879. He died at Ottumwa, Iowa, June 1, 1879.

SHILOH, city of Israel. See TABERNACLE.

SHILOH, BATTLE OF. This battle was fought, April 6 and 7, 1862, between the Union forces under Gen. U. S. Grant and the Confederates under Gen. Albert Sidney Johnston, the object being the capture by the latter of Pittsburg Landing, on the west bank of the Tennessee river, the base of Grant's contemplated operations. The battle takes its name from a log meeting-house, named Shiloh, near which the heaviest fighting took place.

On the loss of Fort Donelson, Feb. 16, 1862 (see FORT DONELSON), Gen. Johnston determined to abandon the line of the Cumberland and to concentrate his forces at Corinth, Miss., the point of intersection of the two principal Southern railroads—the Memphis and Chattanooga, and the Mobile and Ohio. At Murfreesboro' he made connection with Gen. George B. Crittenden, who brought with him the remnants of his force which had been defeated by Gen. G. H. Thomas at Logan Cross Roads, Jan. 19. On the fall of Fort Henry, Johnston had assigned the district west of the Tennessee to Beauregard, with instructions to concentrate all available forces also at Corinth, and this general, on the fall of Donelson, evacuated Columbus and constructed defences at Island No. 10 of the Mississippi and at Memphis, to check the advance of the Union forces by way of the great river.

Immediately on Clarksville's being evacuated by the Confederates it was occupied by Gen. Grant and Commodore Foote, who set about making preparations for an assault on Island No. 10 and Memphis. But Grant appeared to move with less alacrity than Halleck required, and the result was an episode that threatened to check a brilliant career. Irritated at a seeming disregard of his orders, Halleck reported to Washington that Grant had left his post without leave, and the consequence was that he was ordered to remain in arrest in Fort Henry and give over his command to Gen. C. F. Smith. The arrest lasted but a week, whereupon Grant proceeded to Savannah to resume the leadership of his command, which had advanced hither under Smith. He found himself at the head of six divisions—the three he had with him at Fort Donelson, increased by those of Gens. Sherman, Prentiss, and Hurlbut. On the 14th Smith (then in command) had sent Sherman up the Tennessee to Eastport, to destroy the railroad communications there, but he, finding this impracticable, returned and landed at Pittsburg Landing on the west bank of the river, and found Hurlbut already there. This landing is 8 miles above Savannah, and had been indicated by Halleck as a place of rendezvous whence to make raids on the railroads. Corinth lay 26 miles S. W. Grant, judging it unsafe that his forces should be thus divided, assembled three other divisions around the landing, and stationed the sixth, that of Lew Wallace, 5 miles down the river at Crump's Landing. Nelson,

with the advanced division of Buell's force, arrived at Savannah on the evening of the 5th, but did not arrive opposite the landing till the evening of the first day of battle, when it had to be ferried over. Before the battle Grant had at the landing a force of some 33,000 men. His neglect to intrench Pittsburg Landing in the face of a more powerful enemy has been severely criticised.

We turn now to the proceedings of the Southern commanders. The delay of four weeks, due to the divided ambition and hesitation of the Union generals, had enabled them to revive their men's courage and re-gather and re-enforce their dispersed armies. On March 23 Johnston and Beauregard had effected a junction at Corinth, and their united forces amounted to over 40,000. Johnston's plan of campaign was to concentrate his whole force before the great bend of the Tennessee, and, this effected, to crush Grant before the arrival of Buell. When he heard on the 3d of April that Buell was in motion from Columbia, he at once decided to strike the crushing blow ere the junction could be effected. The following letter to Jeff. Davis, written on the 3d, explains not only his motive but the disposition of his troops: "General Buell is in motion, 30,000 strong, rapidly from Columbia . . . to Savannah . . . Confederate forces, 40,000, ordered forward to offer battle near Pittsburg, all converging to-morrow near Monterey or Pittsburg. Beauregard second in command; Polk, left; Hardee, centre; Bragg, right wing; Breckenridge, reserve." The Confederate advance was carried out as projected, except that the difficulties of the roads caused the loss of a day. On the evening of the 5th they bivouacked in the forest, in front of and within two miles of their enemy. No suspicion of their proximity dawned on the mind of any Union general. General Grant himself, who was at headquarters at Savannah, wrote on this same 5th to Halleck: "The main force of the enemy is at Corinth."

The Union position was strong. It had the Tennessee on its left flank, which was further protected by gun-boats. The ground was easy to defend, consisting of undulations intersected by numerous streamlets and ravines, and—save for a few clearings of from 20 to 80 acres—covered with wood, partly brush and partly forest trees. It is bounded on the south by Lick Creek, which enters the Tennessee 2½ miles above the Landing, and on the north and partly on the west by Owl Creek, an affluent of Snake Creek, and then by that stream till it falls into the river a half-mile above the Landing. From the swampy nature of the banks an attack could be made only in front. The rivers and creeks enclosed a high triangular plateau with sides three or four miles in length. Two roads from Pittsburg to Corinth run along the main ridge, and from these a net-work of minor roads diverged to various points. Two miles from the Landing, on the western Corinth road, stood Shiloh meeting-house, which marked the centre of the battle-field and was the key to Grant's position. The disposition of the Union troops was as follows: Sherman held Shiloh; Prentiss was to his left, with McClelland to his right somewhat in the rear. Half-way back toward the Landing were the divisions of Hurlbut and of Smith (the last commanded by W. H. L. Wallace, Smith lying sick at Savannah). On the extreme left was Stuart, with one brigade of Sherman's division. Gen. Lew Wallace's division was at Crump's Landing. Grant had thus 33,000 men in line between Owl Creek and Lick Creek. Accounts indicate somewhat of a gap between Sherman's left and Prentiss' right.

The Confederates stood deployed for the attack in three lines. The Third Corps and one of Bragg's brigades formed the advanced line, reaching from Sherman's right to beyond Prentiss' left, and numbered 9024 men. Bragg's remaining five brigades,

numbering 10,731, stood about 800 yards behind Hardee and leaning more to the right, as far as Stuart. Polk's four brigades and Breckenridge's three were disposed right and left as reserves. In all Johnston had about 40,000 men.

At 5 o'clock on Sunday morning, April 6, the Confederate lines moved to the attack. The time required to pass the two intervening miles, and skirmishes between the pickets and a reconnoitring regiment, put the Union front on the alert, and when the lines came together the divisions of Sherman, McClernand, and Prentiss were in position to offer stubborn resistance. It would be vain to attempt to follow the vicissitudes of the fight, which, beginning at dawn, lasted till sunset. It has been characterized by Grant as a conflict between Southern dash and Northern pluck and endurance. There were onset and repulse without cease, but through all fluctuations the Confederates won their way northward, in accordance with which, Beauregard, to whom Johnston had committed the general direction of the fight, advanced his headquarters from point to point. Early in the day the divisions of Hurlbut and W. H. L. Wallace had been brought forward to sustain Prentiss, Sherman, and McClernand. It was in the afternoon that the most noteworthy incidents occurred. First occurred the death of the Confederate commander Johnston, who fell heading the charge of a brigade. About 3 o'clock the withdrawal of troops produced gaps both on left and right of Prentiss and Wallace, and the enemy were not slow in seizing the advantage. They enveloped them. Wallace was mortally wounded and Prentiss was captured, along with the fragments of both divisions to the number of 2200.

This capture left a break in the Federal line, and, but for one compensating circumstance, would probably have given the victory to the Confederates. The Union lines had been swept back a mile and a half, and the attack was advancing on the Corinth road running along the principal ridge. Col. Webster, of Grant's staff, foreseeing that the enemy were on the eve of gaining the ridge, gathered what guns he could, and posted a line of artillery of 35 to 50 pieces along the ridge, manning it with cannoneers largely extemporized from stragglers. The guns on the boats co-operated with those on the ridge. The turning-point was now reached. Before Webster had succeeded in beating back the last desperate onset, Nelson's division was mounting the bank from the river and deploying in line. All chance of a Confederate victory vanished. The attack ceased over all the line.

During the night Crittenden's division of Buell's army, was placed in position, and McCook's reached early on Monday morning. Buell, who had arrived on Sunday evening in advance of his vanguard, directed the posting of his divisions, which amounted in all to 20,000 men. Lew Wallace, with his division, numbering 6500, had arrived from Crump's Landing, and was stationed on the right.

Grant and Buell now agreed to take the offensive next morning, and by a simultaneous onset drive the enemy from the field. The two wings of the combined army advanced steadily, and by 3 p. m. were in possession of all the ground they had lost, while the enemy was in full retreat on Corinth. The Union generals made no attempt at pursuit, but contented themselves with an advance sufficient to assure them the enemy had disappeared. Thus ended, after a struggle of two days, the bloodiest battle that had yet been fought on American soil. The Federal loss was 1754 killed, 8408 wounded, and 2885 missing. Gen. Beauregard reported a loss of 1728 killed, 8012 wounded, and 957 missing. Both sides claimed the victory; but the Confederates failed in the object they aimed at.

(J. H.)

SHIP-BUILDING. The vessels in which Columbus made his first voyage to America were the Santa Maria, the Pinta, and the Nina. The Santa Maria was about

100 feet long, 29 feet wide, and 12 feet depth of hold, with a single deck. The Pinta and Nina were much smaller, open like boats, but with cabins and quarters built at the stern and bow for the officers and crew. They had two masts, the forward one carrying a square sail, and the after one a triangular sail, attached to a yard, hanging by its middle at an angle of about 45° with the horizon.

Ship-building in America, as with all other countries, was brought about by the fisheries. Cabot, in 1497, having spread the news that the shores of North America were teeming with fish, many expeditions were sent out, and in a few years both France and England had hundreds of fishing vessels catching fish off the banks of Newfoundland, and curing and salting them on the island. By 1600 England was sending more than 200 vessels annually, and fully 10,000 persons were employed in catching and curing fish, and as explorers pushed in toward the shores of what are now Massachusetts and Maine, they found that better fish could be caught in shallower water than off the Banks, and the desire to found fishing colonies was one of the strongest motives leading to the grant by James I., in 1606, to the Plymouth Company.

The vessels sent to fish were very small as compared with the vessels of the present day which cross the Atlantic. Not more than 15 per cent. of the vessels of England, in 1582, were more than 75 feet long by 23 feet wide by 10 feet depth. In 1603 England had few vessels of more than 400 tons burden.

The coast from Newfoundland to Virginia was soon dotted with little fishing villages. The English merchants did not wish to go to the expense of carrying a large number of men on their vessels, and these fishing villages were places where the men could be left permanently to dry the fish, and by their numbers be secure against attacks from the Indians.

The colonists soon began to build boats and fish for themselves. This was not at all relished in the mother country, and in 1670 orders were issued to capture and burn the boats and break up the boat fisheries of New England. This was not effectual, and soon vessels were carrying fish for sale to Virginia and the West Indies, and finally to Europe, and whalers were penetrating to the icy regions north and south. The vessels taking out cargoes of fish came back loaded with the commodities of the countries visited, and vessels gradually were drawn into regular trade, the fishing fleet being at hand to furnish masters and men. A valuable commerce was in this way brought about, and the demand for vessels stimulating ship-building, it became a fixed and prosperous industry within a hundred years of the time of the first permanent settlement.

The first ship built in this country was the Virginia, built at the mouth of the Kennebec River, in 1607. A party came to found a fishing settlement, and the two ships bringing them over returned, leaving 45 persons behind. The winter being very severe, they were discouraged and built the Virginia to take them home again. She was a well-built little vessel with two masts, about 60 feet long by 17 feet beam by 10½ depth of hold, and made several voyages across the ocean. The next vessel built was the Onrest, 44½ feet long and 11 feet beam. She was built by Adrian Blok at New York, in 1615-16, to replace one of the Dutch vessels that had been burnt. She was used for several years in exploring the Atlantic coast.

No other vessels except boats appear to have been

built until 1631, when, on July 4, the vessel *Blessing* of the Bay was launched at Medford for the use of the Massachusetts colony. Gov. Winthrop wished to send a vessel to open communications with the Dutch at New York, and for trading with other places. She was used for some time, and then was probably wrecked.

The fact that timber was rapidly being exhausted in England was a strong inducement to British merchants to import timber and, later, to build vessels in America. Matthew Craddock located a claim and established a ship-yard on the Mystic River. Several large vessels were built there and sent to England. The ship-building industry seemed to thrive in Salem from the first, and the village soon became noted for its ship-yards and the vessels built therein. Before 1640 the transatlantic trade was mostly carried on in European vessels, but in that year a vessel of 300 tons was laid down at Salem for a company, with the Rev. Hugh Peters at its head, and a vessel of 150 tons was begun at Boston, both vessels being launched the following year; and in 1641-42 three vessels were building at Salem, three at Boston, and one at Dorchester. The success of these vessels started a ship-building industry, a number of New England towns began to build vessels for foreign service, and the merchants of Barbadoes, Antigua, and Jamaica sent to New England for their vessels.

Ship-building was early engaged in by the settlers of Connecticut, and sloops and other small vessels were built along the Connecticut River, especially at New Haven, from the white-oak, chestnut, and pine which abounded in that vicinity.

The Dutch West India Company encouraged ship-building at the mouth of the Hudson by granting special privileges to take timber from the forests to build ships, though most of the work was done at the ship-yard of the company. After New York passed into the hands of the English, ship-building was continued. In 1669 a vessel of 120 tons was built at New York, and one of 65 tons at Gravesend, L. I. In 1700 there hailed from New York 124 vessels of 100 tons and under, and from Boston 194, among them vessels of 300 tons. About this time the shipping of New York was much injured by the war then waging between France and England, and for many years after the ship-yards only turned out small sloops, the main ocean carrying being in European bottoms.

Most of the building during colonial times was done in New England. In 1698 an act was passed providing for the inspection and registry of vessels of 30 tons and upward. The colonial archives in Boston show that of the vessels registered from 1698 to 1714, 1332 were American built, 239 of them for foreign owners.

The vessels of those days, while small, carried large crews and usually were armed; thus the ship *Richard*, of 100 tons, carried 14 men and 12 guns; the *Prudent Sarah*, 100 tons, 14 men and 10 guns. The magnitude of the ship-building industry just prior to the Revolution can be understood from the following: In 1769 the Colonies built and launched 389 vessels, 113 square-rigged, and 276 sloops and schooners, of an aggregate burthen of 20,000 tons. Of these Massachusetts provided nearly one half, New Hampshire and Rhode Island the next largest number, while New York had only 5 square-rigged vessels and 14 sloops and schooners. Pennsylvania owned 1344 tons, Virginia 1249 tons, North and South Carolina 1396 tons, Connecticut 1542 tons, and Georgia one sloop and one schooner whose combined tonnage was 50 tons.

In this same year the entrances to the ports of the United States amounted to 332,146 tons, and the clearances to 339,302 tons, of which 99,121 tons cleared for England, 42,601 for Southern European

and African ports, 96,382 for the West Indies, and 101,198 for the rest of America. The aggregate value of all the imports was £2,623,412, and of the exports £2,852,441, of which Great Britain sent £1,604,975, receiving in return £1,531,516.

During the revolution the fishing and whaling fleet was nearly annihilated by the British cruisers lying off the coast, and ship-building was suspended. The idle fishing and merchant fleets were employed in privateering. The first privateer built was by a Newburyport merchant, and she took 23,360 tons of shipping, and 2225 men, the vessels and cargoes selling for \$3,950,000.

Four frigates and three sloops-of-war were built for Congress, familiarizing our people with the building of large, powerful vessels, and these were followed by large privateers as private ventures of the merchants of Philadelphia, New England, and Baltimore. In consequence of this, there were many vessels at the end of the war that were too large for the coasting trade, and they entered into competition with the rest of the world, especially for the East Indian trade. The first ship carrying the new flag to enter Canton was a Baltimore vessel, and she sailed thence with a cargo of teas, china-ware, and silk. In 1788 the ship *Atlantic*, of Salem, displayed the American flag in Surat, Bombay, and Calcutta.

When in 1814 peace was declared, after the war of 1812, it was at once realized that after so long a stagnation in commerce there would be great profits to those first in the field with ships and cargoes, and within a few days after the receipt of the news all the idle yards were full of busy workmen, and from this time till 1861 our maritime career was most prosperous.

Forty years of war had led the American to design ships for speed and handiness, and our builders carefully studied the models and rigs to attain these qualities. Clumsy shapes and looks were discarded, and our vessels were models of beauty and were capable of developing great speed.

While ships naturally took the shapes best fitted for their special trades, the tonnage law also had an effect on them, as the tonnage was computed from the length and breadth measured on deck, and the depth was taken as one-half the beam. In consequence of this the length and breadth on the upper deck were kept as small as possible, the bow was lengthened out on deck, and the sides bulged out at the water-line, so that the tonnage, estimated from the deck measurements, was less than the actual tonnage. Roomy ships were obtained, but the government did not get its just dues, as ship-builders courted the reputation of building the roomiest ship on the least official tonnage measurement.

A special class of ships, carrying both freight and passengers, came into existence just after the War of 1812, to meet the demand of the great ocean travel then beginning, and to carry the great number of emigrants to America. Such vessels, usually barques and ships, were most luxuriously fitted up, and would carry from 600 to 1000 people and 1000 tons of freight. New York was the centre of the packet business, and the Black Ball line was started by Isaac Wright & Co. just after the War, sailing twice every month to Liverpool. This line was soon followed by others sailing to London and Havre. There was a strong spirit of rivalry among the various lines, and this led to a study of the principles of ship design and construction. Our builders not only studied all that was to be learned from foreign books, but conducted experiments with models. The shape of swift fishes was studied, and the behavior of water and the influence of different dispositions of sails were fully investigated. Such study and experiment placed our ship-builders ahead of others, and our models were copied the world over.

by ship-builders. As a result of the years of study from 1812 to 1850 the American sailing-vessel reached perfection, and practically no advance has been made since then.

Till 1849, the packet was a one- or two-decked vessel, with poop and topgallant fore-castle, of an average register of 1000 tons. Freight was stowed in the lower hold. Between decks the cabin passengers were stowed aft, the middle portion was devoted to cooking and pantries, and the steerage passengers and crew were quartered forward.

The first three-decker, the *Guy Mannering*, was built at New York in 1849, by Wm. H. Webb. She was about 190 feet long, 40 feet beam, and 29 feet depth of hold, and of 1419 tons register, and would carry 2400 tons of freight on a draught of 20 feet. This noble ship set the fashion, and the three-decker was from this time the popular type of packet ship. Our ships carried the finest officers and crews of any vessels afloat, were well built and well sailed, and being fast and comfortable, they drove the vessels of other nations from the field and had a practical monopoly of passenger, mail, and express traffic. Excellent time was made. The *James Baine* sailed from Boston to Liverpool in 12 days and 6 hours, and the *Red Jacket* from New York to Liverpool in 13 days 7 hours; but the average time was, of course, greater, about 20 days to Liverpool and 32 to return.

English steamers began to compete with the packet lines about 1840, the *Cunard* line beginning that year, supported by a subsidy of £90,000 a year, soon increased to £145,000. The *United States* started the *Bremen* line in 1847, and the *Collins* line in 1850, but in 1857 all subsidies were withdrawn, and ships of these lines were taken off. The civil war of 1861 was the final blow to our packet ships. This packet period is noted for the great increase in size of vessels. In 1714 ships were in the China trade of only 200 tons burthen, and our present lumber schooners would have been considered immense vessels; but about 1812 large vessels began to be built, and from that time on the increase in size is most remarkable. About 1825 the *Washington*, of 1000 tons, drew crowds of people to the wharves in all the ports she visited. In 1841 the largest merchantman in the world was built and launched at Bath, by Clark & Sewall. She was called the *Rappahannock*, and though of light scantling, lasted twenty years.

The packet ship was followed by the clipper, since cargoes that deteriorated on the voyage had to be carried, and the changing character of the markets made speed as important for freight as for passenger traffic. The clippers of 1840-50 sat low in the water, with sharp bow, fine water-lines, tall masts, with enormous spread of canvas. The first clipper ship was built by Wm. H. Webb in 1841, for the China trade. She was the *Helena*, of 450 tons. She was built for speed, and fully realized the expectations of her builder. The discovery of gold in California gave a great boom to the clipper ship, as everything that could be bought in the East was sent to California by freight, and our yards turned out vessels the largest and finest that the world had ever seen.

The years 1854-5-6 are noted for the number and beauty of the vessels built in the United States. In these first years of the California gold fever \$40 per ton of 40 cubic feet was paid from the East to New York, and ten years later it was \$25.

The first clippers had sharp floors, considerable drag, with a full forward and a lean after-body. This was gradually changed, the vessels of 1840 being made fuller on the floor, and with a more even keel, but the hollow water-line and long bow were retained. These clippers made excellent speeds. The *Red Jacket* once made 325 miles a day for a

week, and the *Sovereign* of the Seas once made 437 miles in 24 hours. The average time was about 7 knots per hour. (See CLIPPER SHIPS.)

In 1847 a first class vessel cost here about \$80 per ton against \$90 in England.

Many new appliances were due to the clipper-ship competition, such as double topsails and various devices to save labor, such as steam saw-mills, derricks, etc. Labor was divided, too, as the early ship carpenter was a Jack-of-all-trades and would do all the work, from hewing out the frames to caulking the seams. But this practice was not found to yield the best results, and separate gangs of men did the carpentering, caulking, fastening, painting, etc., leading to better and quicker work. About 1835, when the supply of oak timber grew small in New England, Southern timber began to find its way into the Northern yards. Forests of magnificent white oak were growing in the peninsulas of Delaware, Maryland, and Virginia. The moulds or patterns were made for the frames of a vessel, and parties of men were sent into the woods in the winter, where they camped, and felling the trees, hewed the frames from them and carried them by rafting or other means to some place where they could be loaded upon schooners, to be taken to the Northern ship-yards. The frames of vessels built along the New England coast are still obtained from the forests in the States named.

Southern pitch-pine was used for beams, decks, and waterways, clamps, etc., and in time came to be used for the ceiling and planking of vessels. For the masts and spars white pine and spruce are preferred, though lower masts are made up often of oak, maple, or yellow pine, dowelled, bolted, and hooped with iron.

The coasting trade and the California wheat trade to Europe still employ a large number of sailing ships. Sailing ships are still more profitable for long voyages with certain classes of cargo than steamers, and many such are built, though the number of large vessels will gradually reduce each year, as the steam engine becomes more economical in coal consumption.

The tonnage and number of sailing vessels built during the last five years is as follows:

	Number.	Tons.
1884.....	780	134,187
1885.....	583	74,723
1886.....	475	50,986
1887.....	545	50,376
1888.....	584	76,080

Before 1861 the schooner had come to stay as the coasting vessel. Fewer men are required with this rig, and it can be worked in and out of harbors more easily than the square-rigged vessel. On account of the shallow harbors and sand-bars of the eastern coast the greater number of the Atlantic coasting schooners have flat bottoms, and are fitted with centreboards. The lines are free, the beam large, and the bow sharp and long. For ocean voyages and for the Pacific waters most of the schooners are built with keels. In our coasting trade schooners are used to transport lumber, coal, ores, and ice, and for fishing purposes. The yards in Maine still turn out a number of large schooners each year. The *Governor Ames*, built in 1888 at Waldeboro, is one of the largest schooners afloat. The length on the keel is 232 feet, over all 265 feet, beam 50 feet, depth 21 feet, lower hold 13 feet, between decks 8 feet. She has a tonnage registry of about 1800, and will be able to carry about 3000 tons of coal on a draught of 20 feet. In her construction 460 tons of Virginia white-oak are used in the framing. The planking is 6 inches thick, at the gunwale 7½ inches, the heaviest planking ever put on a schooner. The centre board is 33 feet long, 15 feet deep, and 9 inches thick, made of white-oak. One

hundred and fifty tons of bolt iron are used in her fastenings. She has nine cargo hatches, 25 feet across. The most striking point about this great schooner is her rig of five towering masts, designated respectively the foremast, mainmast, mizzenmast, jiggermast, and spankermast. The five lower-masts are each 115 feet long and 30 inches in diameter. The topmasts are 56 feet in height. The jibboom is 75 feet long and 22 inches in diameter at the bowsprit-cap. She will spread 63,000 square feet of canvas.

The building of whaling vessels, now almost discontinued, was once a great industry in New England. These vessels were not large, as a rule not exceeding 400 tons register. The largest whaler was the *George Washington*, of 600 tons. The earlier whalers, built for use and not for show, were clumsy to look at above water, but under water the model was usually very good, being sharp on floor and ends, deep, and with the greatest beam forward of amidships. Of late lighter sterns and more shapely bows have been introduced, and the whaler looks as neat as any of her sister vessels of the merchant fleet. No material except the very best, and that without flaw of any kind, was put into a whaler by the builders of New Bedford, New London, and Sag Harbor. Every detail was carefully looked out for with a care not known in any other branch of ship-building. Especial care was taken in calking the seams, and the vessel was often hauled down on one side to open the seams on the other for calking. The *George Howland* and the *Roman*, calked in this way, sailed for eighteen years without recalking. The result of careful building is shown in their longevity, vessels being serviceable seventy-five years after building. The scantlings and fastenings of whalers are in the main heavier than are required by underwriters for insurance in the merchant navy.

Steam-whalers have lately come into use. In 1879 the *Mary and Helen* was launched at Bath, Maine. She is 133 feet long, 30½ feet beam, registers 420, carries a full spread of canvas, and has a screw engine capable of driving her from 6 to 8 miles an hour. She is built of oak, yellow pine, and hackmatack, and cost \$65,000. Since then several others have been built.

The sailing fishing fleet of the United States is large, and many different classes of vessels are used, which cannot all be described here. The rig and shape of boat is such as is best adapted to the peculiar conditions of service required, ranging from the Chesapeake Bay canoe and bug-eye to the fishing schooners of the North.

Steam Navigation.—After the invention of the steam-engine, efforts were made to use it for locomotion on land and sea. The greatest need at that time was to tow vessels when entering or leaving harbors, and to propel boats on canals and against river currents. Jonathan Hulls patented a stern-wheel boat in England in 1736 to be used for harbor towing. In America John Fitch built a vessel to run on the Delaware in 1786-87. This was fitted with banks of vertical oars on each side, a beam carrying the oars being attached to a crank from the engine situated in the boat, dipping the oars in the water, moving them aft, lifting them out and forward, to repeat the first motion. This was America's first steam-boat, and a speed of from 4 to 7 miles was obtained. James Rumsey tried forcing a current of water from a pipe at the stern by steam-power. Fitch in 1793 made the first experiment with the screw propeller. The boat used was about 18 feet long by 6 feet wide, with a screw wheel at the stern, worked by a horizontal, walking beam engine with a wooden cylinder at each end of the beam. The cylinders were made like barrels and the boiler was only an iron pot with

a wooden lid. A speed of 6 miles an hour was obtained.

The men, however, who made steam-navigation a success were John Fulton, with his partner Livingston, and John Cox Stevens, of Hoboken. Fulton and Livingston made their first experiments on the Seine, at Paris, building two small boats in 1803 and satisfying themselves as to the feasibility of steam-propulsion.

Stevens worked on screw propulsion for thirteen years, and in 1804 built a boat, the *Phoenix*, 25 feet long, driven by a Watt's engine and screw, obtained a speed of 4 miles an hour, and finally took the vessel by sea from Hoboken to the Delaware, the first ocean steam-voyage.

Fulton bought a 20 horse-power engine in 1806, and came to America to start steam-navigation, his original idea being to build boats for the Western rivers; but when he, with Livingston, obtained exclusive rights for steam-vessels on the Hudson, all their efforts were then made in that direction. His boat, the *Clermont*, was built on the East River, in 1807, by Charles Brown. She was at first 133 feet long, 16½ feet wide, and 7 feet deep, but was afterward made 141 feet long by 22 feet wide. She had a flat bottom, straight sides, a full bow, and a straight stem. A bottom was laid of 1½ inch yellow pine, tongued and grooved and set with white-lead, and floors laid across this, 24 inches apart, made of oak of 8-inch square section under the machinery, but at the ends of spruce, 4 by 8 inches in section. The boat was decked only at the ends, and the boilers were in full view. The paddle-wheels were 15 feet in diameter, with buckets 4 feet long and with 24 inches dip. The shaft was of cast iron, 4½ inches in diameter. A heavy fly-wheel was at first carried, 10 feet in diameter, but as this extended down into the water it was inconvenient in shallow water, and was afterward removed.

The boiler was 20 feet long, 7 feet deep, and 8 feet wide. The engine cylinder was 24 inches in diameter by 4 feet stroke. The boat drew 28 inches of water.

On the first trip 110 miles were made in 24 hours, and 150 miles in 32 hours; or, deducting stops, in 28½ hours, an average of 5 miles per hour.

While the first trial of this vessel was looked upon with the greatest interest, the satisfactory introduction of steam-navigation brought about the enmity of the numerous packet lines carrying the freight and passenger traffic. Sloops would make the trip from New York to Albany in 27 hours, the passenger fare being \$5, and they lost no opportunity to annoy the *Clermont*, even going so far as to wilfully run against her to smash the paddle-wheels. However, after being lengthened, in 1810, as stated above, she made many successful trips, always running full of passengers. In 1808 Charles Brown built the *Raritan* and the *Car of Neptune*. In 1812 a ferry-boat was built to run to the Jersey shore. The double-ended ferry-boat, drooping at each end, so familiar to the American travelling public, was designed by Fulton and has been but little modified since.

Steam-boats quickly sprang into existence in other parts of the world, after being proven a success by Fulton. One was built on the St. Lawrence in 1809, and another in 1811. The British built their first steam boat at Glasgow in 1811, and boats were soon building all over the kingdom. Builders were enabled to put in the necessary plant to build marine engines on account of contracts for steam men-of-war, and by 1839 England had 96 such vessels.

The war of 1812 did not interfere with the development of the steam-boat in this country. Fulton proposed to the government to build a steam warship, the first in the world, to steam at 4 knots per hour and to carry guns pointing in every direction,

for \$320,000. The offer being accepted, the vessel was built in 1814. She was 156 feet long, 56 feet wide, and 20 feet deep, drawing 10 feet of water. The paddle-wheel, for protection, was hung in the middle of the hull; it was 16 feet in diameter, the buckets 14 feet long, with 4 feet dip. Her tonnage was 2475. The boiler was 22 feet long by 12 feet broad by 4 feet deep, the cylinder 4 feet in diameter by 5 feet stroke. She made a speed of 5½ knots an hour, and was a most formidable vessel. Her magazine blew up in 1829, destroying the vessel.

In 1809 the first race on the Hudson took place between rival boats, Fulton's boat beating. For many years nearly all the steam-boats were built by Charles Brown, but the industry soon spread, and vessels were built at Newburg, Philadelphia, and Baltimore.

To Robert L. Stevens the Hudson is principally indebted for its steamers, as he carefully studied the conditions of river navigation and led off in engine improvements and in making the ends of vessels long and sharp. Old boats were lengthened and some had false bows put on; while some of the vessels built after 1830 had solid ends, so sharp and so well designed that they parted the water with scarcely a ripple, and lately such vessels as the Mary Powell have attained speeds of 25 to 28 miles an hour.

To traverse Long Island Sound boats were built broader and deeper than the river boats, as they experienced rougher weather. The Rhode Island, built in 1836, was 212 feet long and 28 feet wide.

Fulton started with the paddle-wheel, and it is used to this day for river navigation, but the screw, being much better adapted for deep-sea service, has entirely superseded the paddle-wheel in ocean-going steamers. The invention of the screw is directly connected with the story of the advance of ship-building.

As our earlier boats built for river traffic used the paddle, developments were in that direction, and but little attention was given to the valuable experiments of Fitch and Stevens. But in England they needed something different from the paddle, as the paddle, being often out of the water during rolling and pitching, was not suited to ocean work, and in 1825 a premium was offered for the best device for propelling vessels other than by paddles. A naval officer invented a screw with two blades, and one or two boats were fitted with it. This caused more attention to be devoted to the subject, and in 1836 patents were taken out by F. P. Smith, of London, and John Ericsson. Smith's screw was a spiral wrapped about an axis, and having been tried on a small boat, a larger vessel, the Archimedes, 125 feet long, was built, fitted with a screw 5 feet 9 inches in diameter and 8 feet pitch, the blade making a complete turn round the axis, this being shortly replaced by two blades making half-turns. The Smith screw was not commercially successful, but the world owes to John Ericsson the development of a new and successful method of propulsion.

The first practical screw vessel was the Francis B. Ogden, built in 1837, and named after the U. S. consul at Liverpool, who had perceived the advantages of Ericsson's screw. This boat, 45 feet long, was fitted with two screws, 5 feet 3 inches in diameter, consisting of a hub of iron around which were placed several plates having a spiral twist. This little boat, drawing 2½ feet of water, developed a speed of 10 miles an hour, and towed a schooner of 170 tons at 7 miles an hour. The Admiralty refused to encourage Ericsson, however, as it was held that vessels could not be steered with such an arrangement.

Capt. Robert F. Stockton took a trip on the Thames in the Ogden in 1837, and at once gave an order for two iron boats fitted with the Ericsson

screw. One of these, the Robert F. Stockton, was launched in 1838. She was 70 feet long by 10 feet beam by 6½ feet draught. She had two propellers in line, 6½ feet in diameter. She made 12 knots an hour. The vessel was rigged as a schooner and sent to America under sail under the command of Capt. Crane, with a crew of four men and a boy, being the first iron vessel to cross the Atlantic. She was sold in 1840 to the Delaware and Raritan Canal Company, and her name changed to the New Jersey. She was used as a tug for several years.

Capt. Stockton having introduced the screw into America in this way, and its advantages being recognized, it at once sprang into favor, and in less than ten years 150 screw vessels had been built in America. It was through Stockton that Ericsson gave up his engagements in London and came to America. The government concluded to fit one of the war-ships authorized in 1839 with an Ericsson propeller, and the Princeton was so fitted, the machinery being placed below the water-line, the first war-vessel of this class in the world. She was 164 feet long, 30½ feet beam, and drew, with outfit and 200 tons of coal, 19½ feet. She had flat floors amidships and a sharp bow and stern. The stern post was 26 inches thick where the screw shaft passed through it, tapering above and below. The stern overhung 15 feet, and hanging from it was a wrought-iron rudder-post, heeling on an oak extension of the keel, leaving a space of 6 feet between the stern and rudder-posts. The screw was made of a brass drum 8 feet in diameter, fitted with six brass blades having a helicoidal twist, extreme diameter 14 feet, pitch 35 feet, length in direction of the axis 2 feet, and weight 12,000 lbs. The vessel made 13 miles an hour. The cost was \$212,000.

The iron tug R. B. Forbes was built at Boston in 1845. The first tug fitted with screws, built at Philadelphia, was built by Wm. Cramp in 1849, the engine being made by Jacob Neafie. This tug was of wood, 80 feet long by 17 feet wide by 8 feet deep. The screw up to this time had been placed below the keel, but Mr. Cramp, seeing the disadvantage of this, gave the tug Sampson a six-foot screw, extending 3 feet below the hull, with a keel built down aft to protect, and in a short while he made another step in advance and placed the screw above the keel in the position where it is placed to this day.

The English still adhere mainly to the paddle-wheel tug, but the handy American screw tug-boat is undoubtedly superior. The average tug is about 90 feet long by 18 feet wide by 9½ feet deep. They are sharp and deep, draw about 8 feet of water, having low free boards and considerable sheer forward. The machinery is covered by a house, with a pilot-house at the forward end. Strong towing bits are placed forward and aft.

The first steam-vessel to cross the Atlantic was the Savannah, built by Crockett and Fickett, at New York, in 1819. Originally intended as a sailing packet, she was rigged as a ship, a 90-horse-power engine placed between decks, with boilers in the hold, and was fitted with paddle-wheels. In May, 1819, she was taken by Capt. Moses Rogers to Savannah, and on May 25 started thence to Liverpool, making the passage in 25 days, during 18 of which she was under steam. The Savannah was not a fast boat, and her machinery was finally taken out, and she was wrecked on Long Island. However, she showed to the world what could be done in steam-navigation, and England at once began to develop this part of her mercantile marine and navy. She granted subsidies to lines to various points, and by giving contracts for a number of steam men-of-war enabled ship and engine builders to put in the expensive plants necessary for this sort of work.

The screw propeller made its first appearance in

the coasting trade in 1841, on the *Clarion*, built for the service between New York and Havana. Philadelphia, however, was much more energetic in developing the screw than New York. The fact that our builders did not develop the screw but kept to the paddle was one of the reasons that our merchant marine suffered with the coming in of the steam-vessel. The greater part of the capital was then in New York. The engines of the larger vessels, like those for the Pacific Mail, were built at the Novelty Works in New York, and having the patterns for the engines and all the necessary drawings of paddle-ships, they were naturally averse to building screw steamers. These works passed into the hands of the Brown Brothers, the bankers, who controlled a large interest in the Pacific Mail, and in this way the building of large paddle steamers for ocean navigation was kept up. The immense paddle-shafts that had to be imported from England were constantly breaking, making the expenses of such vessels beyond their earnings.

On March 3, 1847, Congress authorized the secretary of the navy to contract for a mail steam-ship service once in two months, or oftener, from New York to Chagres, on the Isthmus of Panama, and from Panama to Astoria, touching at Monterey, San Diego, and San Francisco. The Atlantic branch was called the United States Mail, and the Pacific branch the Pacific Mail. Three ships were built for each line, all wooden paddle-wheel steamers, with wheels from 33 to 36 feet in diameter. While the three ships of the Pacific Mail, the *California*, *Panama*, and *Oregon*, were on their way to the Pacific, the news of the discovery of gold in California reached the East, and when the *California* arrived at Panama an excited crowd of people was there waiting to be taken to the north.

While the gold fever brought into existence the great clipper ship, it also gave an impetus to the construction of steamers, as the trade on the Pacific reached in one year a magnitude beyond twenty years' ordinary development, and, a steam-fleet being needed, steamers were built one after the other. In the course of the next ten years the two lines spoken of above had alone built 29 fine vessels of 38,000 tons registry, costing about \$8,300,000, and in those ten years the vessels of these lines carried 175,000 persons to California, and brought back \$200,000,000 in gold. The vessels became larger and larger, wooden vessels attaining sizes up to 3300 tons register in 1861; the *Golden City*, of 3373 tons, built in 1864, was 343 feet long and 45 beam.

The steamers of the two principal lines were built in New York, and ship-yards lined the East river. Wm. H. Webb having as many as a thousand men in his yard. The New York builders attained a world-wide reputation, and obtained orders for war-ships from Russia, France, Italy, Portugal, and Turkey, among them being the General Admiral, the iron-clad frigates *Re d'Italia* and *Re Don Luigi de Portugal*, each of 3700 tons, and the iron-clad ram *Donderberg*, of 6000 tons, 380 feet long and 75 feet beam.

In the four cities of New York, Philadelphia, Boston, and Baltimore there were built from 1830 to 1861 about 80 sea-going steamers, with an aggregate tonnage of about 120,000, and costing about \$29,000,000. Five-sixths of this tonnage was built in New York. The first large American ocean steamer was the *Massachusetts*, sent out from Boston in 1844, with a screw propeller as an auxiliary power.

The *United States*, built in 1847 by Wm. H. Webb, was intended to be a New Orleans packet, but was eventually sold to the German Confederation for war service. She was 256 feet long by 40 feet beam by 304 feet deep. For 50 feet at each end, the frames, deadwood, and keelsons were of live-oak, locust, and

cedar; amidships the lower timbers were of Southern white-oak. There were five rows of yellow-pine keelsons amidships, 8 feet deep, and four rows 16 inches deep. The bilge streaks were 12 inches square. This boat throughout was exceptionally strong, and the manner in which the large structure of wood was tied together, in this and similar vessels, gives evidence of the great skill and experience of the ship-builders of this date. This vessel had full floors with but little dead rise, and a sharp bow and run. Her model is about that of the sea-going American steamers of to-day, though a longer, sharper bow is built with iron vessels.

In 1845 the postmaster-general was authorized to contract with Mr. Edward Mills for 20 trips a year to Europe for the sum of \$400,000, and in 1847 the Washington and the *Hermann* began to compete with the English steam-ship lines, which were rapidly obtaining the advantage over our sailing vessels. Those vessels were long, square-sterned three-deckers, with side paddle-wheels about the middle of the length, bark rigged, and with a full allowance of sails. They were very good sea boats, but were beaten in time across by the Cunarders from two to three days.

In 1850 the Franklin and Humboldt were built for the same service, but were put on a line to Havre. About this time the idea of a line to Liverpool took shape, as our capitalists and ship-builders, who had so easily kept in the lead in the days of the fast packets and clippers, did not like to see the English absorb our carrying-trade, and only asked to be put on an equal footing with the English shipping men that they might again take the lead. Mr. Edward K. Collins originated and carried through the idea of placing American ships on a line to Liverpool, to surpass the English vessels running to that port from America. Under the laws of 1845 a contract was made with Mr. Collins whereby he was to build and run four steamers from New York to Liverpool, to make twenty trips a year and to carry the mails, the line to receive \$385,000 a year. These vessels were to be suitable for war purposes. The Cunarders then running were from 1140 to 1500 tons register. All the Collins boats were about 2800 tons, each of the best materials and workmanship, and supplied with unusually powerful machinery. They were the pride of America, being the largest and fastest steamers then afloat. The four steamers first built were the *Arctic* and *Atlantic*, built by Wm. H. Brown, of New York, under the inspection of George Steers, and the *Baltic* and *Pacific*, built by Brown & Bell, of New York. The machinery was built by the Novelty and Allaire Works, of New York.

The details of construction of the *Arctic* and *Baltic* are as follows:

Length on main deck, 282 feet; depth under spar deck, 32 feet; beam, 45 feet. The frames were white oak and chestnut with tops of locust, live-oak, and cedar; stanchions and timber-heads of white oak; apron, breast hooks, and inner stern-post of live-oak; keel of white oak, 18 by 20 inches. The frames were double-sided 24 inches and moulded 21 inches over the keel; the lower futtocks were sided 12 inches; all other timbers, 10 inches. The spacing was 30 inches amidships, increasing to 36 inches at the ends, with the floors filled in solid to the turn of the bilge. The ceiling-clamps and water-ways of the lower decks were of yellow pine, the fine bilge streaks 12 inches square, bolted through the edges every 4 feet; the clamps of the lower deck, 8 inches; upper deck, 7 inches. The garboards were white oak, 15 inches wide, 9 inches thick, copper-bolted through the edge with 1-inch bolts every 3 feet and with two bolts through each timber. The rest of the outside planking was of yellow pine, 5 to 7 inches thick and 6 to 8 inches wide. The main keelson was white oak, 32

by 34 inches. The side keelsons under the engines were white oak, 22 by 42 inches; elsewhere, of yellow pine. The beams were mainly yellow pine, excepting some white pine in the spar and orlop decks; the lower and main deck beams, side 12 to 14 inches, and moulded 13 inches at the centre and 10 inches at the ends; the spar deck beams, 6½ by 8 inches at the centre. The decks were of white pine: orlop deck 3 inches, lower deck 3½, main 4, and spar deck 3. The bulwarks were 3-inch white pine. The knees were white oak and hackmatack. The hull was square, fastened with two ¾-inch copper bolts and two locust treenails to a draught of 20 feet; above that, galvanized iron and treenails were used. The frame was strapped with iron crossing amidships like lattice-work, with a spacing of 4 feet. There were two side lever engines: cylinders, 95 inches in diameter, 10 feet stroke. There were four tubular boilers, 22 feet long by 14½ feet high, two of them 14 feet wide and two 15 feet wide. The hull weighed about 1525 tons, and masts and rigging 3½ tons. On a draught of 19½ feet forward and 20 feet aft 2000 tons of freight and 250 passengers could be carried.

The service began with these vessels in 1851, and they beat the Cunarders from the start by about one day. They enjoyed the confidence and the patronage of the travelling public, and in eight years from the time they began passenger traffic increased fivefold. From January to November, 1852, they carried 4306 passengers to the 2969 who went by the Cunard Line, and their competition reduced the cost of freight to Liverpool from £7½ to £4.

The Cunard Line at once began to put on larger and faster steamers. Collins' mail allowance was made \$858,000, and greater speed was required of him, and he met the requirements. Unfortunately, the Arctic was lost in 1854 and the Pacific in 1856. In 1855 the Adriatic, of 4144 tons, was built, at a cost of \$1,100,000. She was 345 feet long by 50 beam by 33 feet depth. She made a trip in 1861 from Saint John's, N. F., to Galway in 5 days 19½ hours.

Beginning in 1853, the feeling against subsidies was awakened, and it continues to this day; while, as a matter of fact, the granting of subsidies is a business-like application of statesmanship, and its continuation would have kept us in the front rank in the transatlantic trade, and could not have failed to have been of the greatest value to our ocean commerce, our ship-builders and ship owners, our people and our country. In 1857 the Collins mail contracts expired, and the government refused to renew them; Mr. Mills suffered in the same way.

The English were then paying \$866,700 a year to the Cunard line, and smaller sums to other lines, and as Mr. Mills and Mr. Collins could not compete with England's treasury they were forced to withdraw and sell their ships, and the United States deliberately turned over the vast mail, express freight, and passenger business of this country with Europe to foreign ships. In 1856 Mr. Vanderbilt started a line to Havre, but soon gave it up. During the civil war the foreign lines got a very strong foothold. In 1866 an American line was formed in Boston, and two large oak-built screw steamers, the Erie and Ontario, were started to run between Boston and Liverpool. The English steamers immediately cut rates, and soon the American ships had to be withdrawn. A line was afterward started from Baltimore in connection with the B. & O. R. R., but had only a brief existence.

An American steamship line was started in 1873 to run from Philadelphia to Liverpool, and it still lives; but few American lines have been started at other points. The coasting lines, such as the Clydes and the Red D. have extended their trade to Cuba and Mexico. Commodore Garrison ran a few wooden steamers from New York to Brazil after the war, aided

by a subsidy, and John Roach ran a line of steamers from 1878 to 1881. The Pacific Mail has sent steamers to the Sandwich Islands, Japan, China, and Australia.

America is renowned for nothing more than for her river steam-boats, the necessities of internal navigation developing this class of vessels earlier than ocean steamers. As the Mississippi and its tributaries drain a region of 1,250,000 square miles in extent, embracing nineteen States rich in products of every kind, and several growing Territories, using the streams as commercial highways, it is natural that there should be a great demand for vessels to traverse them. Certain restrictions were put upon builders by the character of the rivers to be navigated, owing to the light draughts necessary. The western boats are marvels in the way of light-draught construction, as there are vessels which on six feet draught of water carry 2000 tons of freight. These boats, to ascend the river against strong currents and to tow a large number of barges, must be fitted with engines of great power, and the weight of the engine has been greatly reduced on this account. The walking beam and the condenser was soon dispensed with, the engines being so placed as to act directly on the paddle-shaft. The earlier steamers were mostly side wheelers, but after 1850 the stern wheeler came into favor, and they now outnumber the side wheelers three to one.

Fulton and Livingston in 1811 built at Pittsburgh the stern-wheel boat Orleans, of 200 tons, rigged with masts and sails. She used wood for fuel. She was strongly framed, but had no guards or upper works. She arrived at New Orleans, Jan. 10, 1812, for the first time. She made about three miles an hour. After running as a packet between New Orleans and Natchez for about two years she was sunk by a snag in 1814. Before this the navigation had been by flat-boats, pushed along with poles or long sweeps, or by small sail-boats. The availability of the steamer was at once apparent, and they were built rapidly from this time on. The stern-wheeler Comet, with vibrating engines, was built in 1813, and ran to New Orleans, where her machinery was sold to a cotton factory. The Vesuvius was built at Pittsburgh by Fulton in 1813, and a small steamer of 50 tons was built at Brownsville, on the Monongahela, in 1814, and the same year the Etna, of 200 tons, was built at Pittsburgh. The Washington, the first boat with two decks, was built at Wheeling. The machinery, which in previous boats was in the hold, was in her brought up on deck, where it is still placed in the boats now in use on the western rivers.

Preceding boats had such low-power engines that they could only be employed on the lower Mississippi and Ohio when the current was less than three miles an hour, and they could never get up the swifter rivers after having once gone down. The Washington, however, was a powerful boat for her day, and was able to make a round trip from New Orleans to just below the falls at Louisville and back in 45 days. Her success started the building of a number of steam-boats along the Ohio, where nearly all the earlier boats were built, and where about five-sixths of the boats of the Mississippi Valley are built now. In 1818 the General Pike was built at Cincinnati for passenger traffic. She was 100 feet long on the keel, 25 feet beam, and had a handsome cabin built on the deck between the engines. The central hall was 40 by 18 feet, with 8 state-rooms at one end and 6 at the other. She ran as a packet between Louisville, Cincinnati, and Maysville.

There were but few Eastern boats used on the Western rivers. The Maid of Orleans, of 100 tons, was sent from Philadelphia in 1818 and went up the river as far as Louisville, being the first vessel to reach that city from an Atlantic port. She was a two-masted

schooner, with auxiliary steam-power for use on rivers.

Up to 1818 the fastest trip from New Orleans to Louisville was made by the *Shelley*, the time being 19 days. She carried 51 passengers, a cargo of groceries and dry goods, and stopped at ten places *en route*. The usual time was from 25 to 30 days. The fast steamer *Cincinnati* made the round trip in about 40 days. After 1830 determined efforts were made to improve the speed, and in 1838 the *Diana* ran from New Orleans to Louisville in less than 6 days, winning a premium of \$500 from the Post Office Department for doing so.

The passenger boats were side-wheelers, built of oak, framed and planked much the same as sea-going vessels. They had flat floors and sharp bows, and drew from 4 to 6 feet, and were from 400 to 600 tons register. The cabin was between the engines, the upper cabin becoming popular later.

When fast boats became the rage there was a fierce rivalry, and racing was very common. Boats were sent over the course stripped of every possible weight that could be dispensed with, and without cargo of any kind, driven at the full power of the engines, simply to beat previous records and establish a reputation for speed. Until legislation regulated the strength and pressure of boilers, this passion for fast time led to great loss of life and property on account of explosions.

From 1830 to 1840 the favorite size was about 150 tons, but after 1840 larger boats began to make their appearance, and a departure was made in the use of lighter scantling and different construction from sea-going vessels. The *Sultana*, built in 1843, was 250 feet long, 35 feet beam, and 8 feet hold. There were seven boilers, 32 feet long and 42 inches in diameter. The engines were 30 inches by 10 feet stroke, the paddle-wheels 30 feet in diameter, with 14 feet buckets. She developed a speed of 15½ miles an hour, and made one trip from New Orleans to Louisville in 4 days 22 hours.

In 1852 the *Eclipse*, one of the largest boats built in the West, was built at New Albany just below the falls. She cost \$300,000 and was sumptuously fitted up with a richly furnished saloon, with a steerage cabin on top. There were 8 boilers, 32½ feet long by 42 inches in diameter, and two engines: cylinders, 36 inches by 11 feet stroke. The paddles were 41 feet in diameter. Her light construction will be seen from the size of her scantlings. The frames were single, and were cut from 4 and 4½ inch fitch-oak, moulded 13 inches on the floor, 10 inches at the bilge, and 5½ inches at the head. The main keelson was 12 by 16 inches, the bilge log 7 by 11½ inches, and there were 18 floor keelsons, ranging from 3½ by 10 inches to 4 by 11 inches. Fore and aft wooden bulkheads were put in to strengthen her. She was planked with 3½ to 4½ inch oak. She was for many years the most popular and fashionable boat of the West. Her greatest speed up the river was 16 miles an hour, and she often made 25 miles an hour down stream.

The *Shotwell* was built in the same year. She was a sharp boat, built for racing, and in 1853 she raced the *Eclipse*. Both vessels were stripped for the race and carried neither passengers nor freight. Furniture, landing stages, and fenders were left behind, and even the bulkheads in the wheel-houses and parts of the decks were removed. The *Shotwell*, on account of being shorter, could turn the bends

more quickly, but she ventured too close and got aground, losing 2½ hours, and thereby the race. The *Eclipse* made the trip from New Orleans to Louisville in 4 days 9 hours and 30 minutes, having lost 35 minutes during the race by blowing out the packing of a piston. A number of large, swift steamers followed those boats, ranging from 250 to 300 feet in length, fitted up in the most comfortable and beautiful manner. These boats were usually owned in Pittsburg, Cincinnati, and Louisville.

The civil war interrupted the river traffic, and a good many of the older vessels disappeared. But after the war new steamers appeared, superior even to the old. Two of these were the *R. E. Lee*, built in 1866, and the *Natchez*, in 1869. The *Lee* was 300 feet long, 44 feet beam, and 10 feet deep, with engines 40 inches by 10 feet stroke, the paddle-wheels being 38 feet in diameter, with 16½ feet paddles. The *Natchez* was 301½ feet long, 42½ feet beam, and 9½ feet in the hold. Her engines were 34 inches by 10 feet stroke, paddle-wheels 42 feet in diameter, with 16 feet paddles. In 1870 these two boats raced from New Orleans to St. Louis, 1200 miles. They were stripped for the race and ran at about 17 miles an hour, were in sight of one another most of the way, and only an hour apart at Memphis and Cairo. The *Lee* arrived at St. Louis in 3 days 18 hours and 14 minutes, and the *Natchez* arrived 6 hours and 33 minutes later.

A great number of boats have been built of late years. A description of the *City of New Orleans* will give a very good idea of the construction generally in use. She is 300 feet long, 48 feet beam, 83 feet over the guards, and 9 feet hold. Her draught, with machinery, coal, and water on board, is 20 inches forward and 42 inches aft. The frames are single, 9 by 4 inches, spaced 15 inches; main keelson, 21 by 9 inches; eight floor keelsons, 9 by 4 inches; four wing keelsons, 7 by 12 inches, to receive the heels of the stanchions and the hog chain braces; bilge keelson, 6 by 12 inches; planking, 4 inches on the bottom, and 4, 3½, and 3 inches on the sides. The beams are 4 by 6 inches, spaced 21 inches, with heavier beams 12 by inches at the end of the boiler deck; stanchions, every other beam 6 inches square, in seven rows, with thirty extra stanchions 10 by 3½ inches under the cylinder timbers and paddle-shaft. There are three stringers on the top timbers, each side, 9 by 2½ inches. The clamps are 13 by 3½ and 12 by 3 inches. The five boilers are on deck, forward, and are 30 feet long, 44 inches in diameter, with five flues each. There are two engines, one on each side amidships, 26 inches in diameter by 10 feet stroke. The paddle-wheels are 35 feet in diameter, with 15 feet paddles. The cabins and pilot-house stand up to a great height above the water. The saloon is 220 feet long, 17 feet wide, and 13 feet high. There are forty-five staterooms, 12 feet long by 10 feet wide. This boat is for the passenger and cotton trade of the Mississippi, and on 9 feet draught will carry 250 passengers and 2300 tons of freight.

With a light-draught boat of this sort the girder formed by the structure is a shallow, and there being but little buoyancy at the sharp ends, a most elaborate system of hog and cross chains is carried out. These are long iron rods stretching from end to end and from side to side of the boat. A hog frame, such as is seen on so many of the boats around New York, is hardly ever seen in the West. The fore and aft arrangement of these hog chains is shown in the

Hog Chains of the *City of New Orleans*.

accompanying sketch. They fasten under the main and floor keelsons, and run up over the ends of long rows of square pine masts, set up perpendicular amidships, but inclined at the ends.

The main chain is 2½-inch bar iron, carried on 9-inch square pine braces, rising 14 feet above the main deck. The centre chain is 1½-inch bar iron, the forward end descending to the main keelson just under the after end of the boilers, the chain running back over the main braces and being brought down to the keelson again about 15 feet from the stern-post. The stern chain is 1½-inch iron, passing over one

Cross Chains of the City of New Orleans.

brace. The boiler deck and bow chain is 1½-inch iron on short braces forward, as shown.

There are seven cross chains of 1½-inch iron resting on seven of the main braces, with struts as shown, giving support to the bilge of the boat; and under the boiler deck and forward there are nine more such chains of 1½-inch iron; 48,000 pounds of wrought iron are made use of in this system, and by it the guards are made sufficiently strong to carry any number of bales of cotton, the hull is kept from breaking down at the ends, and the light scantling of the West is rendered possible.

On the upper part of the Ohio, the Mississippi, and the Arkansas, and the other tributary streams of the West, the passenger, freight, and towing boats are stern-wheelers. The boats are not so wide, and for shallow-water traffic are superior to the side-wheelers. Naturally, the boats are different from the side-wheelers. The wheel-houses and guards are dispensed with, the cylinder timbers are carried aft and project about 25 feet abaft the hull proper, having a slight sheer upward. The paddle-wheel shaft rests on these timbers, and the system of hog chains is carried aft to support and distribute the weight of the wheel. The lines of the boat aft are completely changed, as there is no taper to the after-end. The after-body is carried back square, and the floor is brought up at the stern, giving an appearance of two hulls when looked at from the stern. Three or four rudders are used, the side ones hung on the upright stern-posts, while the middle ones are hung on stout rudder-posts and project partly under the boat, being balanced rudders. The passenger and freight boats of this class are handsome boats, from 200 to 265 feet long and from 35 to 40 feet beam.

The towing boats are not so large and have small cabins, but are built with very strong bows. The way in which tows are made up on the western rivers is different from the methods of the seaports, as the tow is not towed but pushed. The barges are arranged in groups, often eight or ten boats wide and four boats long, strongly lashed together, and arranged ahead and alongside the forward end of the steamer, about one-fourth the steamer being buried in the group. The deck is carried out square to the bow, ending in a strong chock for pushing. To steer such a fleet around the bends of swift rivers requires a great deal of experience and judgment. The stern-wheeler Jos. B. Williams, built at Pitts-

burg, went south from Louisville last year with a mammoth tow of 30 coal-barges, and six barges and three additional vessels, amounting to 798,434 bushels, or 33,340 tons; including fuel, 31,388 tons. This tow was 789 feet long—including the steamer, 1015 feet long—and 262 feet wide. To transport this tow by rail would require 60 trains of 25 cars each, 20 tons to the car, and would extend over a continuous line of track of ten miles.

There are four classes of barges in use on the Western rivers. The smallest is the flat-boat, about 90 feet long, 16 feet wide, and from 5 to 7 feet deep, used on small streams for short trips for carrying about 110 tons of coal, stone, or other rough freight. Next, the coal-barge, which is an open boat, strongly built, with raking ends, about 125 feet long by 25 feet wide by 8 feet deep. They are mainly employed between the coal mines in Pennsylvania and West Virginia and the markets along the river as far as New Orleans. The coal-boat or broad horn, is a flat-bottomed, square-ended boat, with a strong bottom but light sides, about 175 feet long by 25 feet wide by 9½ feet deep. The fourth is the model barge, having hulls built like steamers, sharp at both ends, decked, and sometimes having a house.

Flat-boats are built up on the sides of four or five tiers of solid white-pine logs, 6 to 8 inches thick, laid one above the other, and strongly bolted through the edges with square iron spikes, with sheer pieces on the top at each end. A number of cross timbers, about 6 by 12 inches and 12 feet apart, with the ends tenoned into the lowest log, form the side. Under these are fastened fore and aft streaks, and the bottom is then planked across with 2- and 3-inch hemlock, white pine, or oak. Iron straps are placed at the corners. Uprights are let into each end of the floor-timbers and bolted to the sides, and bitts are provided for towing. These boats cost from \$500 to \$650, the labor on one of them amounting to about \$100, using from 13,000 to 18,000 feet of lumber and 1450 lbs. of iron.

The coal-barge is simply a large barge, the side-pieces being in several pieces about 20 to 50 feet in length. It requires about 34,000 feet of lumber and 3000 lbs. of iron for one. They cost from \$1000 to \$1200, about \$190 of this being for labor. They weigh about 45 tons net, and draw about 5 inches of water light.

The coal-boat or broad horn has a barge-bottom, with one side-log about 9 by 16 inches, strengthened at the scarples by a piece inside 18 feet long, about 4 by 16 inches, fastened on with 10 large treenails, 7 or 8 screw-bolts, and a number of spikes. A row of uprights, 6 by 2½ inches, is set up perpendicularly from the side or bilge-log all around the boat, and the side planking is fastened to those. It is usually 1½-inch hemlock. A couple of threads of oakum is driven into the seams. A light clamp is nailed around on the inside of the uprights to support light beams or braces, about 4 by 4 inches, which are put in about 8 feet apart. These boats cost from \$800 to \$900, and, while having about twice the capacity of a barge, contain about the same amount of lumber.

These three classes of boats were originally propelled with huge paddle-wheels or sweeps, consisting of a heavy pole with a stout board at the end. This is no longer done, on freight barges, though the sweep-propelled boat is still met with on the Southern bayous and sluggish rivers, in the shape of flats that have been decked over and housed, and are fitted up as travelling tin-shops, blacksmiths' shops, and trading vessels.

Of the model barges there are four sizes, carrying 600, 800, 1000, and 1200 tons of cargo respectively. They are sharp at both ends, and are built about like the steam-boat hulls, but have but one hog chain, which hooks under the main keelson at the bow and

stern, and is supported on four or five pine posts. Light collision bulkheads are built at the bow and stern, and when the hold is intended for grain or packages it is ceiled up in such a manner as to form a cargo box, with an air-space of as much as two feet between the ceiling and the frames. A barge, 200 feet long, 36 feet beam, and 6½ feet hold, with a cargo box 169 feet by 33 feet by 11 feet, costs about \$9000.

The great highway of travel and trade in Oregon is the Columbia river, ocean steamers from San Francisco ascending the river as far as Astoria and Portland, numerous small steam-boats carrying freight and passengers farther into the interior. Steam-boat building was begun about 1850. The Eliza Anderson was built at Portland in 1858, and by her longevity showed the advantage of using properly seasoned yellow fir for boat-building. The earlier boats were side-wheelers, but the later ones are stern-wheelers, which are better adapted to shallow waters. The Columbia river stern-wheelers are not similar to those of the Mississippi Valley described above. The keel, forward, begins to rise 15 or 20 feet from the bow and runs into a rocker stem; aft, the stern is not separated into two parts, but the bottom begins to rise 20 or 30 feet from the rudder and nearly reaches the surface at the stern, which is cut off square above the water. Sagging is prevented by iron rods hooking into the keelsons forward and aft, running up to a line of masts, and these are screwed up till they take the weight off the bow and stern. The hulls are made of fir, the houses of white cedar and fir. The central masts are carried high up, as there are no bridges to interfere. The barges are somewhat similar to the ones described above, nearly all, however, having small houses on deck. There are small schooners on the river dealing in butter, eggs, and produce, that are fitted with small auxiliary propellers for going against tide and current.

The pioneer of the lake steamers was the Ontario, of 232 tons, built at Sackett's Harbor, in 1816, a side-wheeler, 110 feet long. The next vessel built on the American side was the Walk-in-the-Water, of 342 tons, built at Black Rock in 1818. In the following ten years twenty steamers were built on the lakes of Ontario and Erie, mostly on the American side, all side-wheel boats.

The Welland Canal was opened in 1829, and stamped a special character on lake vessels. The smallest locks were 110 feet long, 22 feet wide, and 8 feet deep. The sailing vessels were thereafter made with bluff, full forms, with round bows, flat bottoms, and straight bodies, in this way securing the greatest capacity; and steamers intended to pass through the canal approximated to the same form.

The steamers intended for local traffic kept a sharp form, and were never shallow as the eastern river boats. Many of the steamers were side-wheelers, ranging from 250 to 600 tons, occasionally larger. The engines were of the low-pressure walking-beam type, and were fitted with masts and sails for use in case of injury to the machinery.

The Walk-in-the-Water went to Detroit as early as 1818, and by 1830 steam-boats were running regularly to Chicago. The number of boats increased rapidly after the opening of the canal, and the size began to increase rapidly after 1844, a number of long, fast sharpies being built from that time on. They were built mainly of oak, the decks, houses, and spars being of white pine. They had very high and sumptuously furnished cabins. The Plymouth Rock, built in 1854, 310 feet long, and the City of Buffalo, built in 1857, were among the last of the large side-wheelers built. About 300 side-wheelers were built in all, but now not more than 3 or 4 are produced yearly, and these not above 800 tons; and

many of the old side-wheelers were converted into propellers, and others into floating docks and barges.

The Welland Canal being impassable by the large side-wheelers, and many important harbors being on rivers and canals, screws came into favor.

The first propeller on the lakes was the Vandalia, of 138 tons, built at Oswego, N. Y., in 1841. She was fitted with a mast and sail, with machinery well aft, the smoke-stack being nearly in the stern. In ten years 53 screw vessels were built, ranging in size from 150 to 700 tons. The vast freight traffic of the lakes has called for larger vessels, and the canal has twice had the sizes of the locks increased.

The vessels employed exclusively for freight are called steam-barges. These have small houses forward and aft, and sometimes as many as four masts. These barges carry coal, grain, iron ore, and lumber.

The machinery is placed aft in the lake propellers, and when not loaded the bow sits high up out of the water. This is convenient when loading, but the rough weather of the lakes strains the vessel when unloaded; so the hog frame was early adopted, and it was given the form of an arch sweeping in a long curve from end to end of the ship, the top chord made of several thicknesses of 6- or 8-inch oak breaking joints. These arches being in the way, especially in handling lumber, they have been dropped, and strength is now secured by strapping the hulls on the outside of the frames and ceiling them heavily with oak, broad arches often being bolted to the inner side of the hold timbers.

IRON SHIP-BUILDING.

The first iron boat known to have been built in the United States was the Codorus, built in Pennsylvania for service on the Susquehanna. New York led in the early iron building. In 1836 an iron vessel of 600 tons was built there. In 1838 an iron boat was built at Pittsburg, and in 1841 a revenue cutter was built at Boston, and by 1842 Philadelphia had built a line of small iron steam-boats to trade with Hartford, Conn. The iron hulls were first built by boiler-makers; there was but little shape given to the vessel, the bottom being built on a platform and the sides brought up vertical, the frames being put in last. However, the ship-builders in wood were appealed to and they soon began to put in tools for building the iron hulls; and they were not contented with box-like shapes but soon brought the lines of the iron vessel up to those of the wooden vessel. While the greatest ingenuity and mechanical skill and knowledge were shown in binding together and strengthening the hulls of wooden vessels, the great horse-power and lengths required for high-speed vessels called for a stronger material than wood, and the iron ship became a necessity. The earlier vessels were framed much in the same way as the wooden vessels, but very soon the iron vessel took a distinctive character very different from the wooden vessels. A history of iron ship-building is mainly the history of the well-known ship-yards of this country. Wm. H. Webb stands at the front as a wooden ship-builder, and the names of Cramp and Roach are known the world over as builders of steel and iron vessels. The United States has furnished many vessels to foreign governments. Wm. H. Webb built the Re d' Italia and the Re Don Luigi de Portugallo for the Italian government, the former making 14 knots on her first trial, using only four boilers out of six. Webb also built the iron-clad Rochambeau, now owned by France. In Boston the Atlantic works built vessels and machinery for a great many different nations and during the war turned out a number of monitors. In 1858 there was quite a movement in the direction of iron ship-building in New York. The side-wheel steamer Suchil was launched from Bell's yard in 43

days after the keel was laid. The Novelty Iron Works built a large iron steamer the same year, and four iron screw vessels were begun at the Morgan Iron Works. Prices, wages, and taxes are now against the building of iron ships at New York, though there are a number of large machine shops devoted almost entirely to marine-engine work. The home of the ship-builder is the Delaware—the Clyde of America. Here there is the water-front, railroad facilities, trained labor, good climate, and fresh water, with coal and iron almost within reach. It is but natural that here we should find the best ship-yards of the country. One of the earliest iron boats, after the *Codrus*, was a small barge built by Jesse Starr, half a mile from the river and hauled down to the water. The work was mainly done by the large boiler-makers, the hulls being designed and laid down on the mould-loft floor by practical ship-builders. With the earlier vessels there was a great waste of material, the plates being ordered from the girth at the greatest section, considered as carried to the ends, and the first to suggest and carry into successful execution the measurement of the sizes of each plate from a model of the vessel, upon which the plates were drawn out, was Charles H. Cramp, of Philadelphia; a great saving was effected, and this method of ordering material was at once adopted.

It was not till the beginning of the civil war, however, that Philadelphia began to forge ahead of New York; but, large ships being then needed, Wm. Cramp fitted up his wooden ship-yard with machinery capable of making iron plates and frames. The first vessel was the *New Ironsides*, an iron-clad wooden ship (see *IRONCLADS*). When first contracted for, her timbers were still growing in the woods, but she was completed in six months; and, due to the foresight of her builders, she was able to carry a much heavier battery than was first intended. The monitor *Yazoo* was built at this yard, and a great deal of other government work. The plant was gradually improved, and in 1872 a contract was entered into for the construction of four steamers for the American line for \$2,400,000. These were most excellent specimens of American workmanship, and were so well built as to obtain the most favorable rating in the English insurance companies.

After the completion of these vessels wooden ship-building was given up by the Cramps, and since that time they have built four fast cruisers for the Russian government and a number of large steamers and yachts, the best known of the latter being the *Atlanta*, *Corsair*, and *Stranger*. One of the finest freight steamers afloat, the *Herman Winters*, was built by this firm; and the twin-screw passenger steamer *Monmouth* is the first of her class, and by her success will probably cause the paddle to give place to the screw in many cases. The large coasting steamer *Iroquois* is an excellent example of a well-built, comfortable, and speedy vessel. During Pres. Cleveland's administration the secretary of the navy, Wm. C. Whitney, awarded the contracts for five vessels to the Cramps. Three of these are large, protected steel cruisers, supplied with every modern appliance in construction and armament. These are the *Newark*, *Baltimore*, and *Philadelphia*. The *Yorktown* is a fast steel cruiser of about 1700 tons displacement. The fifth vessel is the *Vesuvius*, a dynamite-gun cruiser, armed with three 15-inch dynamite guns capable of throwing projectiles containing 500 pounds of dynamite a distance of two miles. Twenty knots speed were guaranteed, and the vessel attained on her official trial trip 21.65 knots, or about 25 miles an hour.

The firm of Neafie & Levy has been engaged in the construction of iron vessels for a number of years. They have turned out many ships and a vast number of marine engines.

At Camden a number of iron tugs are built each year. At Chester is Roach's ship-yard, covering seventy acres and having a frontage of 2500 feet. Roach first bought the Morgan Iron Works of New York, and in 1872 bought the property at Chester, the first ship being launched at Chester. Vessels have been built here for the Pacific Mail, the Brazilian line, and the coasting trade; also a number of vessels for the U. S. government, a number of the small single-turreted monitors, the double-turreted monitors *Puritan* and *Miantonomoh*, and the *Chicago*, *Boston*, *Atlanta*, and *Dolphin*.

At Wilmington is the Harlan & Hollingsworth Company, which built the first iron coasting steamer in the United States. This yard has turned out many fine vessels, among them the monitors *Amphitrite*, *Patapsco*, *Saugus*, and *Napa*. All sorts of vessels, from yachts to iron-clads, have been built, among the former the victorious *Puritan*.

The Pusey & Jones Company, of Wilmington, has turned out over a hundred iron vessels, of all types, a feature being made of vessels for river traffic.

There is an iron ship-building yard at Locust Point, Baltimore, the Columbian Iron Works and Dry Dock Company. This yard does a great deal of repair work, and has built several large ferry-boats, and is now building the gun-boat *Petrel* for the government.

The Union Iron Works have lately been established at San Francisco, under the management of Irving M. Scott. They are thoroughly well equipped with the best modern tools, and have already entered into competition with the older yards of the East for government work, and have obtained contracts to build two large steel-protected cruisers, the *Charleston* and *San Francisco*.

There are iron ship-yards at Pittsburg and St. Louis, and on the great lakes at Buffalo, Cleveland, and Wyandotte, the lake steamers comparing favorably with vessels built in the yards on the coast. The machinery costs much less in the lake steamers, on account of being used in fresh water.

The United States has now the educated labor and the necessary plants, in private yards, to turn out vessels second to none in the world. The liberal spirit of Congress has provided the money, and the Navy Department, by insisting upon having only the best, in material, design, and workmanship, has advanced the art of ship-building in this country to such an extent that we lead the rest of the world in everything except the construction of heavy-armored vessels.

The government has ship-building yards at Portsmouth, N. H., Boston, Mass., New York, Philadelphia, Norfolk, and Mare Island, Cal. The yards at New York, Norfolk, Philadelphia, and Mare Island are to be fitted up to build iron vessels, the first two already having armored vessels to construct.

The building of the vessels for the navy comes under the cognizance of the Bureau of Construction and Repair. The head of this bureau is Chief Naval Constructor T. D. Wilson, U. S. N. The machinery comes under the Bureau of Steam Engineering, presided over by Engineer-in-Chief Geo. W. Melville, U. S. N.

The capital required in wooden ship-building is not great. Most of the workmen bring their own hand-tools, consisting of broad axes, adzes, saws, bevels, chisels, calking iron mallets and rules, the builder furnishing the large tools, such as cross-cut saws, augers, and belt cutters. In case the yard is supplied with steam, a saw-mill and planer are added. There are yards where large wooden vessels are built where the tools would not bring \$500.

With iron ships it is different; here nearly all the tools are furnished by the builder, and many of them are very expensive and require to be run by

power. A yard to build the hull of a ship of about 2500 tons in a year could be established for about \$60,000, including buildings, but a first-class modern ship and engine building establishment, capable of turning out about 70,000 tons of shipping and 50,000 horse-power, fitted with the latest and most improved labor-saving machines, will cost about \$1,200,000.

Ships cannot be built, even with the necessary plant, without plenty of money. The weekly payroll of a large establishment on the Delaware is about \$30,000, and when, with this, the large amounts spent for material, insurance, and other purposes are taken, it will be seen that a great deal of ready money is required.

Much judgment and business ability is required in handling a large ship-yard; often a slight modification in a method of securing a small part may result in the saving of thousands of dollars, and naturally only those succeed in ship-building who attend strictly to business.

When the price of the ship has been settled upon and the design elaborated, the latter being, as a rule, left to the builders in the case of merchant-vessels, they being given the number of passengers and amount of freight to be carried, together with the speed and character of service, the preparation for building at once begins.

The lines of the vessel, showing the shape on the outside, are drawn out at full length on a large floor, called the mould loft.

Taking the skeleton of a herring and turning it on its back will give an idea of the construction of a vessel; the ribs are called the frames of the ship, and they come down to the backbone or keel as on the fish. Sections are drawn out to full size, showing the shapes of all the different frames, and wooden moulds are made to these shapes. The iron or steel angles that form the frames are heated in long furnaces and drawn out on a large iron floor, called a bending slab, having a number of small holes in it. Upon this slab the mould to the frame has been previously laid and the shape drawn in chalk, and then a number of pins stuck in the holes along the chalk line. The hot angle bar is then forced against these pins and held by clamps, so attaining the proper shape. While bending it is also bevelled, or one side is so shaped that it will conform with the outside plating coming against it. The angle is then taken in some cases to a scribe board, where the curve of the frame has been drawn out and the shape checked, and any corrections necessary are made by bending the frame coil in a setting machine.

An ordinary frame consists of three parts:

1. What is known as the frame angle bar, extending from the keel to the upper part of the side of the vessel.
2. A floor plate, extending across from bilge to bilge, riveted to the frame at its lower edge.
3. A reverse frame angle, riveted to the upper edge of the floor upon the side opposite to the frame angle, and at the terminations of the floor is carried on up on the frame angle to heights varying with the size and type of vessel.

The holes in the frame angle are punched before bending; those in the reverse angle are marked from the frame angle and punched after bending.

The keel is laid upon blocks extending down to the water's edge, the blocks being high enough to allow the workmen to get under to rivet on the bottom plates. The keel blocks are laid on an incline of about $\frac{1}{4}$ of an inch to the foot. They are spaced about 4 to 5 feet apart and have on each side two sets of standards for supporting the staging upon which the workmen stand.

Keels are of three kinds: The bar keel, side bar keel, and flat plate keel.

The keels are the first part of the vessel laid upon the blocks. In the case of the flat keel the vertical keel plate is next placed, and then the frames are

Bar Keel.

raised at points marked upon the keel. The frame, reverse angle, and floor are riveted together on staging about level with the blocks. The complete

Side Bar Keel

frame is then lifted by means of tackles leading from the ends of uprights, which can be moved along abreast of the position of the frame, and the

Flat Keel.

frame is bolted in place. Usually one or more beams are bolted to the frames and raised with them, the beams being the cross pieces upon which the decks rest. The stem and stern posts, made of forged iron or cast steel, are raised in place when the framing is well started amidships.

The lines of the edges of the plates forming the outer skin of the ship are marked on the frames, and these spots are faired by long pieces of wood called battens, and wooden templets or skeleton shapes are put up where the plates are to go. Upon these are marked the holes that are to be punched in the plates and the exact sizes of the plates. These are light and easily handled, and are taken down, laid on the plates, and the positions of holes transferred to the plate. The plate is then sheared nearly to size, and is then planed on the butts and the edges of the outer streaks, the holes are punched and counter sunk, so that the rivet may be hammered down flush on the outside. The plates overlap on the edges, the most common system being that known as the raised and sunken system.

The ends butt against one another and are held by butt straps on the inside. When in place and riveted up the edges and butts are carefully calked, and so

made water-tight. In some cases the beams are plated over to form the deck, the deck plank being laid on the plating, but in other cases plates are carried along the sides of the vessel and wood only used on the rest of the deck.

When all the plating is on the outside, and enough of the inside of the vessel completed to give her the requisite stiffness, she is ready for launching. Launches are usually times of enjoyment, and great crowds turn out to see them. While launches are, as a rule, successful, and the ship glides most easily and gracefully into the water, rarely failing to make a bow to the lady who christens her, it must not be forgotten that to transfer a mass of thousands of tons from supports on land to the buoyancy of the water is one of the greatest of engineering feats, and there are few ship-builders who do not heave a sigh of relief when they see their vessel well water-borne.

The vessel rests on the keel blocks, and on each side of the keel blocks is placed a track or ground way, at an inclination of about $\frac{1}{4}$ of an inch to the foot. These extend well out into the water. On top of these are placed the sliding ways, forming a carriage or slide to support the vessel.

The sliding ways are built up to the vessel, and when all is ready for launching wedges are driven in above the sliding ways. In this way the weight is taken on the slidings and the keel blocks are knocked out, and the vessel, held in place by a trip of some sort or a plank bolted to sliding and ground ways, is released and slides into the water. The machinery is then put in, and the vessel completed in every respect. The fittings of vessels are now very elaborate and costly. The drainage system of a large vessel is far more complicated than that of a house, as everyone of the numerous compartments must be pumped separately, if necessary. There are water-alarms which tell when a compartment is leaking, and alarms to show when a dangerous temperature has been reached in the coal-bunkers. Provisions are made for exhausting foul air from below and for supplying fresh air.

Payments are made in various ways. In private contracts there are various methods, instalments being paid when certain portions of the work are completed, as when the first frame is raised. Under government contracts the payments are made in ten instalments, with a reservation which, together with the last payment, is kept a certain number of months after the vessel has been turned to the government. A 4000-ton merchant steamer is built in about ten months, while the same size man-of-war will take about two years in building—the former costing about \$300,000 and the latter \$1,200,000.

With a merchant vessel, when everything is completed, a run at full power is usually made for several hours, but with a man-of-war an official trial trip must be made on which a guaranteed horse-power or speed must be attained. As speed is the object to be attained in men-of-war of certain types, it would seem most natural to require a certain speed rather than a certain horse-power, though this is not always done.

In beginning the design of a vessel, it is first necessary to know the conditions of service, the load to be carried, and the speed. It is known approximately what ratio the load will bear to the total displacement in the particular service, and, knowing the total volume of displacement, this volume must be enclosed by a shape which will best attain the given speed and suit the conditions of service and give the required room. When what is known as a model tank is available for experiments, a model is towed at various speeds, and the resistances obtained; and from these the horse-powers required to drive the vessel at various speeds can be computed. From these data the engines are designed. Engines can now be

designed that are very light for the horse-power developed, the engines and boilers of the Vesuvius weighing, when the boilers and condenser are full of water, only 250 tons, and developing on this weight 4200 horse-power, giving a speed of 21.65 knots per hour. When a tank is not available for model experiments, the performance of some vessel already built is taken as a basis from which to estimate the required horse-power. The resistance to be overcome is of three kinds: The frictional resistance of the water, which forms the greater part of the resistance at low speeds; the eddy resistance, due to sudden changes of shape or projections; and the wave resistance, which increases most rapidly at high speeds. These are all studied by the naval architect, and every care is taken to keep the bottom clean and well painted to diminish the friction, to get the fairest lines to decrease the eddies, and to choose properly the general dimensions so that the waves raised at the required speed may require the least expenditure of power.

The outlook for the ship-builder in America is excellent. With our large and constantly increasing coasting fleet, wherein the cheap iron ship with economical engines is rapidly becoming a necessity, with excellent rates for freight, and with the wooden vessels fast disappearing, there must be for many years to come a great demand for iron and steel steamers for our coasting trade; and with the uniform cheapening of iron in the United States we shall, in a few years, enter into competition with Great Britain and other European countries in ship-building for the rest of the world.

A bounty bill is to be urged upon Congress providing for the payment, to sail or steam vessels engaged in the foreign trade and built and owned wholly in the United States, of 30 cents per registered ton for each thousand miles sailed, and *pro rata* for any distance less than 1000 miles on any voyage between this and any foreign country or countries. This is excellent, so far as it goes, but our first efforts should be to secure trade, to build up agencies in every large shipping centre where business could be secured for American vessels. Such a method of payment would probably bring about vessels with an exaggerated tonnage measurement and, with economical engines, the voyage would be the main thing and the ports at the greatest distances and with the lowest dues would be visited, and the great object of all—an increased tonnage—would be lost.

A better system, it seems, would be to pay 20 cents per ton of freight carried, and there would then be the decided efforts to get freights and trade which are used at home. Great Britain's vast trade enables her merchants to have agents in every port, and Germany, by sending men to offer her goods, is getting control of what little trade we have in Africa. Europe's cheap money is as much to be feared as her cheap labor, and while we are helping the ship-owner we should likewise help the ship-builder, and pay \$5 00 per horse-power on the engines and \$20 per ton weight of hull when of steel and \$10 when of iron.

In the preparation of the above article the following publications have been freely drawn from: *The Shipbuilding Industry of the United States*, by Henry Hall; *Reports of the Secretaries of the Navy*; *Reports of the Chief Constructor of the Navy*; *Reports of the Commissioner of Navigation*.

(L. N.)

SHIRLAW, WALTER, artist, was born in Paisley, Scotland, Aug. 6, 1838, and was brought to the United States in 1840. He worked for a time as a bank-note engraver, but later took up painting, exhibiting first at the National Academy in 1861. In 1868 he was elected an academician of the Chicago Academy, and two years later he went to Munich, where he spent seven years in study. While there he painted the *Toning of the Bell*, and, later on, his best-known

work, Sheep-shearing in the Bavarian Highlands, which received honorable mention at the Paris Exposition of 1878. Among his works notable for breadth of treatment, and often possessing much decorative quality, are: *Good Morning*, owned by the Buffalo Academy; *Very Old, Gossip*, and *Jealousy*, in the New York Academy. He has also executed a large frieze for the house of Darius O. Mills, New York. He was one of the founders of the Society of American Artists, and has been instructor at the Art League, N. Y. In 1888 he was elected to the National Academy. (F. L. W.)

SHIRLEY, WILLIAM (1693–1771), colonial governor of Massachusetts, was born at Prestou, Sussex, England, and became a lawyer. His literary proclivity was shown by his tragedy *Electra* and the masque, *The Birth of Hercules*. In 1734 he removed to Boston, where he practised his profession. He was employed as commissioner in settling the boundary between Massachusetts and Rhode Island, when in 1741 he was commissioned as royal governor. He planned the expedition against Cape Breton in 1745, in which Louisbourg was captured. He afterward went to England, and was a commissioner at Paris in 1750 to settle the northeastern boundary of New England. He returned to Massachusetts in 1753, and treated with the Indians in Maine. In 1755, when the war with the French was renewed, he was made commander-in-chief of all the British forces in North America. He planned the expedition against Niagara, and led it as far as Oswego, where it was stopped by lack of provisions. His son was killed in Braddock's expedition of the same year. In 1756 Gen. Abercrombie superseded Shirley, who was, however, made lieutenant-general in 1759, and afterward governor in the Bahamas. In 1770 he returned to Massachusetts, where he had built a spacious mansion at Roxbury. There he died, March 24, 1771.

SHOES, as now made, comprise two parts, a sole of thick, solid leather, and an upper of thin and soft leather, often of cloth in ladies' shoes. These parts are fastened together in various ways, usually by sewing or pegging. Until recently the shoe was made outright by a single person, but most of the shoes now made are produced in factories in which there is a well-developed division of labor, a considerable number of workmen being employed on each shoe, while the common use of machinery has replaced much of the old hand-work. No small percentage of the shoes worn in this country are still made in small shops, as custom-work, but even in this branch of the trade labor-saving machinery is employed to a considerable extent. There are more persons employed to-day in the United States in the preparation and the various manufactures of leather than in the manufacture of cotton, linen, and woollen goods, and more than three-fourths of the leather product is used in the making of boots and shoes.

Shoemaking was one of the earliest trades established in the American colonies, and as early as 1648 the shoemakers were legally incorporated as a trade guild. They were most numerous in the town of Lynn, Mass., which has continued to the present day the centre of the American shoe industry. At that time ladies wore mostly stuff shoes, gentlemen boots and shoes made of cowhide, there being few or none made of calfskins till after the Revolution. In 1662 the business of tanning, currying, and shoemaking existed in Virginia, yet as late as 1681 only a few hides were tanned, and most shoes of all grades were imported from England till some time in the 18th century. The legal price of shoes in Virginia at that early date was fixed at 30 or 35 lbs. of tobacco for large sizes. New York also displayed some activity in tanning and shoemaking, but Pennsylvania was more tardy, doing little in this line till

sometime in the 18th century. Toward the middle of the 18th century every new town north of Virginia started its tannery, and shoemaking soon followed; but the bulk of the business continued in New England, while the Southern colonies obtained most of their shoes by purchase.

In 1731 the English parliament, incited by the small demand for shoes from the colonies, ordered the Board of Trade to inquire into the American manufacture, which inquiry resulted in the discovery that the colonists were almost completely supplied with shoes of home manufacture. The family stock of leather was worked up by itinerant shoemakers, who went from house to house, and were followed by itinerant cobblers to repair the worn shoes. In Massachusetts, however, the art was conducted on a larger scale, and considerable exportation of shoes took place to the other colonies and the West Indies. The British effort to lay duties on American imports in 1764 gave a special stimulus to the shoe trade, which continued active till the Revolution. During that struggle for independence the trade was restricted by the great scarcity of hides, and the army suffered greatly for want of shoes. On a requisition from Ticonderoga for shoes to supply over 12,000 men, only 900 pairs could be sent. One-third of the Ticonderoga force was obliged to do duty shoeless in the winter season of 1776. Similar conditions existed in later campaigns. The business revived after the peace, but in 1789 it became necessary to impose a tariff charge to check importations.

As we have already stated, Massachusetts led in the shoe business, and still holds the supremacy. This is particularly the case in the towns near Boston. There are records of shoemaking in Lynn as early as 1635, and in 1650 that town made more shoes than any other in the country. It made a specialty of ladies' shoes, mostly of cloth. By 1750 it had a surplus for export, and sent shoes to New York, Philadelphia, and the South. The business of Lynn largely developed after the Revolutionary war. In 1788 it exported 100,000 pairs; in 1795, 300,000 pairs; and by 1877 its product had increased to 14,000,000 pairs.

The shoes made in the early period were rough, ill-fitting, and imperfect. The workmen were unskilled, and many of the shoes were made by mechanics of other trades, who worked at home at this art in the winter. It was not till 1750 that the knowledge of the art improved. At that period a skilful Welsh shoemaker settled in Massachusetts, who quickly gained a great reputation in the trade by his superior workmanship. The general style of shoes greatly improved under the incitement of his example, and by 1764 Lynn had gained the reputation of making shoes equal to those of London. After the Revolutionary period, other towns came into competition with Lynn for a share of the shoe trade. Haverhill and Danvers early engaged in the manufacture of ladies' shoes, while other towns near Boston successively engaged in the business. Marblehead was one of these, incited thereto by the decline of its fisheries. It now makes about 4,000,000 pairs yearly. The shoes of Lynn are still nearly all women's shoes, the uppers being made principally of lasting or serge, though many are of leather. The work of this town embraces all the light, cheap, machine-sewed styles. Haverhill, which comes next in importance, produces a better quality of shoe, and turns out sewed and pegged work of every kind. Many other places in Massachusetts, Maine, and New Hampshire are extensively engaged in the business, Boston being their commercial centre.

New York is second to Boston as a shoe distributing centre. It has long been famed for the quality of its shoes. Only fine goods are made there, and the city turns out the best factory-made boots and

See Vol. XXI.
p. 830 (p. 869
Am. Rep.).

shoes in the world. Only the finest grades of European calf and kid skins and the best domestic morocco leather are used, with oak-tanned soles. Philadelphia has an equal reputation for the quality of its shoes, while the business has developed in other towns in the interior of Pennsylvania and New York. At present the value of the Massachusetts product is said to be 60 per cent. of that of the entire country, New York about 12, Pennsylvania about 8, and the other States in much lower proportions.

As the shoemaking business increased, workmen began to divide their labor, and each to confine him-

Shoe Pegging Machine.

self to some department, such as crimping, bottoming, heeling, and finishing. Much work was done by associations of journeymen. This system proved advantageous, and has made Boston the principal centre of such operations and the largest shoe market in the world. There have been great improvements in the American manufacture of shoes, due largely to new methods of splitting and currying leather, by which softer and finer material is produced. Remarkable progress has been made in methods of manufacture, the invention of labor-saving machinery greatly increasing the rapidity and cheapness of production. In old times all shoes were hand-sewed. In 1818 the shoe peg was invented by J. W. Hopkinton, of Massachusetts. The

pegs were at first made by hand, afterward by machinery, and at present some 30 establishments are engaged in this branch of the business. There is a shoe-pegging machine in use that is remarkable in its operation, making the pegs and driving them into the shoes at one operation. A shoe can be pegged in ten seconds by this machine. A narrow ribbon of wood, of the thickness of a peg and as wide as the length of a peg, is reeled on a machine to the length of 100 or more feet. One end is pared sharp by the machine. A strong awl worked by the machine pierces holes in the leather, and at the same time a sharp knife splits a peg from the end of the ribbon of wood. The point of the peg is guided to the hole, and as the awl comes out the peg goes in, and is driven home while the awl makes the next hole. The operation goes on with great rapidity, the shoe needing only to be guided and turned. Many other machines are in use, no industry being more benefited in this particular. The sewing-machine was utilized in shoemaking soon after its invention, it being operated by steam, and used in all the large shoe factories. There are other machines for smoothing and rounding the soles after pegging, for last making, and for other departments of the business, the necessary labor on each shoe being much lessened and greatly divided. About 1000 cords of wood are used annually in making shoe pegs, but many of these are exported. One thousand seven hundred pegging machines were in use in the United States in 1873, and where formerly only the coarsest boots and

shoes were pegged, now great quantities of fine pegged work are made. The pegging machine described

was invented in 1851 by A. C. Gallabue, but has been much improved by others. Equally important is the McKay sole sewing-machine, invented about 1858 by L. R. Blake, but perfected and introduced by Gordon McKay. By this machine soles can be sewed on nearly 100 pairs of women's shoes in an hour; 800 pairs in 10 hours is a fair day's work. This machine is in very general use in the United States, and many are used in England and Europe. There are two other sole

Shoe Sewing-machine.

machine making an almost perfect imitation of handsewed work. There are several machines for stitching, chief among them being the Elias Howe and the Wheeler & Wilson. Other machines in extensive use are the cable screw wire and the wire-tacking machines. There are also machines to set and burnish the edges, to make and trim the heels, and

for various other purposes, while there are scores of minor inventions, all of American production. No other country except, perhaps, England is so well provided with factory-made shoes as the United States. In Europe hand-made shoes are still in the ascendant. The wooden shoes so generally used by the peasantry of Europe are cheap and durable, and, though clumsy, are said to be comfortable. An attempt was made to manufacture them in the United States on a large scale in 1863, but with very little success in sale. A few are now made.

A highly important branch of the shoemaking industry, of 19th century introduction, is the India-rubber shoe, now deemed almost indispensable in cities for wet weather and winter wear. The first

of these were clumsy waterproof shoes imported from Para, but no shoes of any desirable value were made till after the perfection of the Goodyear vulcanizing process. The India-rubber shoe industry has since then grown to large proportions, and, widespread as are the uses of vulcanized rubber, the shoe and boot manufacture forms one of the largest branches of its employment.

The manufacture of boots and shoes is at present among the most important of those industries carried on at once in large factories and in a vast number of petty shops. The boot and shoe factories re-

small shops sums up to a considerable amount. In 1880 there were 16,013 such shops, employing 22,667 hands, and producing \$30,870,127 worth of boots and shoes. The total product of the country has increased from \$54,000,000 in 1850 to \$196,920,481 in 1880, while to this must be added a production of rubber boots and shoes to the value of \$9,705,724, making the complete annual product of the boot and shoe industry over \$206,000,000. (C. M.)

SHOSHONES, the name of a family of Indians, also known under the name of Snakes, belonging to the California group, and inhabiting a wide range of country, which extends from Idaho into Utah, and from the Rocky Mountains to the Sierra Nevada. As at present known, they are divided into the Shoshones proper and the Utes or Utahs, but seem connected linguistically with the Comanches, the Moquis, and several tribes of California. Their language, indeed, is the type of a family of Indian languages which seems at one time to have been widely extended. When first seen, by Lewis and Clark, in 1805, they were west of the Rocky Mountains, but had traditions pointing to the east and south as an earlier habitat, they having apparently been driven over the mountains by hostile tribes.

The Shoshones proper include the Bannacks (though some class this as a separate tribe) and several independent bands which bear special names. Most important of these are the Koolsati-Kara or Buffalo Eaters, of Wind river; the Tookarika, Mountain Sheep Eaters, of Salmon and Snake rivers; and the Shoshocoe, White Knives or Diggers, of the Great Salt Lake basin. Some of these bands are fierce and warlike, others mild and inoffensive. They became hostile to the whites about 1849, and continued so, at intervals, till 1863, some of the bands suffering severely in consequence. The Diggers of Salt Lake were nearly exterminated by California volunteers in 1862. Peace was made with most of the bands in 1863, and with others in 1864 and 1865, but the government failed to properly observe its treaty stipulations, and many of the bands resumed hostilities. In 1867 Gen. Steele conducted a campaign against the Shoshones, killing a number of them and destroying their large stores of provisions. Since that date they have been peaceful.

The government set aside reservations on which it sought to gather the scattered bands of the tribe, there being three of these reservations, the Fort Hall, established in Idaho in 1867 for the Bannacks, and several bands of the Shoshones; the Shoshone, established in Wyoming in 1868; and the Lemlie agency in Idaho. The first contains about 1530, the second something over 870, and the third has about 600 Indians. In addition, there are Shoshones in Nevada and Utah estimated at 1000, and a band of 400 in northwest Idaho.

The Shoshones of the several bands differ widely in character of food and modes of life. Most of those of the south live on roots and small animals. In the north they live largely on the fish of Shoshone river, and on large game taken by hunting, in which they are skilful. They are fond of barter and personal adornment, and of games of chance, dress in buffalo and deer skins, and live in skin tents. Among their customs is that of burning or burying with the dead his property, the wife or horse being formerly killed over the corpse. On the reservation Episcopalians, Catholics, and other denominations are making efforts to convert and educate these

Heeling and Trimming Machine.

ported in the census of 1880 numbered 1959, with a product valued at \$166,050,354. The material consumed included 6,831,661 sides of sole leather, 21,147,656 sides of upper leather, and 32,960,614 pounds of other leather, with a total product of 30,590,896 pairs of boots, and 94,887,615 pairs of shoes. Of the factories, Massachusetts has more than half, 982, with a total product of \$95,900,510; New York, a product of \$18,979,259; Pennsylvania, New Hampshire, and Maine, each over \$5,000,000; the remaining product being divided among many States.

In addition to the factory production, that of the

Indians, and are meeting with some success. Vocabularies have been made from the speech of various bands, but no critical study of the Shoshone languages has yet been made.

SHUBRICK, WILLIAM BRANFORD (1790-1874), rear-admiral, was born at Charleston, S. C., Oct. 31, 1790. His father, Col. Thomas Shubrick (1755-1810) had served aside to Gens. Greene and Lincoln. William, with his elder brother, John Taylor Shubrick (1788-1815), left Harvard College to enter the navy in 1806. They served on the Constitution under Stewart and took part in several noted exploits. John was lost at sea while bearing to the United States the treaty concluded with Algiers in 1815. William had the command of a squadron in the West Indies in 1838, and in the Pacific in 1847, at which time he captured Mazatlan and assisted in establishing U. S. authority in California. In 1858 he had command of the Brazilian squadron, and in 1859 conducted the expedition against Paraguay. In 1862 he was retired with the rank of rear-admiral. He died at Washington, May 27, 1874. His brothers, Edward Rutledge Shubrick (1794-1844) and Irvine Shubrick (1797-1849), were also naval officers. The former attained the rank of captain, and had command of the Brazilian squadron when he died, March 12, 1844. The latter had served under Decatur and was captured with him in the President in 1815. He became commodore in 1841, and died at Philadelphia, April 5, 1849.

SHUFELDT, ROBERT WILSON, naval officer, was born at Red Hook, Dutchess Co., N. Y., Feb. 21, 1822. Entering the navy as a midshipman, May 11, 1839, he had risen to the rank of commander in 1853, but in 1854 he resigned from the navy and was for several years in responsible positions in the mercantile service. He was for two years chief officer on the Collins line of Liverpool steam-ships, and thereafter in command of steamers plying between New York and New Orleans. When the civil war broke out he was commander of the steamer Quaker City on the New York and Havana line, and during the first year of the rebellion was U. S. consul-general for Cuba, a situation of high importance, which he filled with eminent tact and ability. He resigned this office in 1863 and was appointed commander, his commission dating back to November, 1862. In the blockade of Charleston he commanded the steam-ship Conemaugh, and took part in the engagements on Morris Island. In 1864 he was in the Gulf blockading squadron. In 1865-66 he commanded the flag-ship of the East India fleet, and that of the Mediterranean from 1871 to 1873. From 1875 to 1878 he was chief of the bureau of equipment and recruiting, and was commissioned commodore in 1876. In 1879-80 he sailed on a special mission to Africa and the East Indies to report on the best means of reviving American trade with these countries. In 1883 he was advanced to rear-admiral, and retired from the service, Feb. 21, 1884. While he was on the African expedition he was presented with a sword by Said Burgash, Sultan of Zanzibar.

SIAM. See INDIA.

SIBLEY, HENRY HASTINGS, pioneer, was born at Detroit, Mich., Feb. 20, 1811, his father being a judge of the Supreme Court of Michigan. He received a classical education, and for a time studied law. This, however, he abandoned for mercantile pursuits, becoming first a servant and subsequently a partner of the American Fur Company, having its stations at Mackinaw and Fort Snelling. His employment led him to make frequent excursions into the unexplored regions of the Northwest, in one of which he reached the mouth of the Minnesota river. He was so charmed with the country that he fixed his home at Mendota, there erecting for

himself the first stone house within the bounds of what has since become the State of Minnesota. Most of his time here was devoted to frontier sports. In November, 1848, he was chosen a delegate to Congress to represent a district cut off from Wisconsin when it was admitted into the Union and had its boundaries fixed. Here he secured the passage of a measure constituting this district, along with a vast additional tract west of the Mississippi, into the Territory of Minnesota, and from this he was elected congressional delegate in 1849 and 1851. In March, 1858, it was admitted into the Union as a State, and he was chosen its first governor. When the Sioux made their great rising, in 1862, he raised and commanded a white volunteer force which, at the decisive battle of Wood Lake (Sept. 23, 1862), broke the power of the hostile savages. For his skill and gallantry here he was made brigadier-general of volunteers, and was afterward brevetted major-general. During Pres. Grant's administration he was appointed a member of the board of Indian commissioners, and in 1871 was chosen to the legislature, where he vigorously resisted repudiation of the State railroad bonds, and was thus instrumental in restoring the credit of his State. In 1888 Princeton College created him LL. D. Gen. Sibley is president of the chamber of commerce of St. Paul, Minn., of the board of regents of the State university, and of the State historical society.

SIBLEY, HENRY HOPKINS (1816-1886), general, was born, May 25, 1816, at Natchitoches, La. He graduated at West Point in 1838, and was appointed 2d lieutenant of the Second Dragoons, serving in the Florida war. Promoted 1st lieutenant in 1840, he served in the Everglades expedition against the Seminoles, and acted as adjutant of his regiment from 1841 to 1846. In 1847 he was made captain, and served in the Mexican war, taking part in the siege of Vera Cruz, in the battles of Cerro Gordo, Contreras, Churubusco, Molino del Rey, and the capture of the City of Mexico, and gaining the brevet of major. For several years he served on the Texas frontier against the Indians, and afterward in Kansas, during the Free Soil conflict, and in the Utah expedition, and the Navajo expedition of 1860. On the outbreak of the civil war he was in New Mexico, where he was promoted major, May 16, 1861, but the same day resigned his commission to enter the Confederate service, in which he was made brigadier-general. Being unable to shake the allegiance of his troops, he raised a brigade of nearly 2500 men in southwest Texas, and at its head left Fort Bliss, January, 1862, to effect the conquest of New Mexico, appearing before Fort Craig on Feb. 16. On the 21st he fought the action of Valverde with Col. E. R. S. Canby, commander of the fort, which resulted in the withdrawal of the Union troops within its shelter. In March he occupied Albuquerque and Santa Fé, but in April he was compelled to evacuate these places and leave the territory for Fort Bliss. After this he commanded his brigade under Gens. Richard Taylor and E. Kirby Smith. At the close of the war he entered the service of the Khedive of Egypt and took part in the construction of coast and river defences. After a stay of 5 years he returned, broken in health, to the United States, and supported himself by lecturing on Egypt. He died at Fredericksburg, Va., Aug. 23, 1886. Gen. Sibley was the inventor of the tent known by his name and, while in the U. S. service, received letters patent for it, but forfeited his rights by his disloyalty. After his death, a claim for compensation was brought before Congress by friends of his family, but it was rejected in February, 1889, and his widow, who is said to have always manifested loyalty to the Union, expired on receiving the news.

SICKLES, DANIEL EDGAR, general, was born in New York City, 1823. He attended the university there, but left it to learn the printer's trade. After pursuing this for some years, he studied law, and in 1841 began practice in his native city. In 1847 he entered the Legislature and became a leader of the Democrats, and in 1853 accompanied James Buchanan to London as secretary of legation. On his return, in 1855, he was elected to the State senate, and next year, to Congress, where he served two terms. In 1859, discovering a guilty connection between his wife and P. B. Key, U. S. attorney for the District of Columbia, he shot the latter dead on the street in Washington, Feb. 27, 1859, for which he was tried for murder, but, after a trial of twenty days, acquitted. On the outbreak of the civil war he raised in New York City the Excelsior brigade, of five regiments, of one of which he was commissioned colonel, and in September he was made brigadier-general of volunteers, in which capacity he served under General Joseph Hooker, distinguishing himself at Williamsburg, Fair Oaks, and Malvern Hill. His brigade served also in the Maryland campaign, and bore a conspicuous part at Antietam. He was appointed to succeed General Hooker in command of the division, and fought bravely at Fredericksburg. When the Army of the Potomac was reorganized, in 1863, he was appointed major-general and assigned to the command of the Third corps, distinguishing himself again at Chancellorsville. His command fought desperately at Gettysburg in defence of its position between Cemetery Hill and Little Round Top, but was forced to yield to superior numbers, and here General Sickles lost a leg. Nevertheless, he continued in active service till early in 1865, when he was sent on a mission to Colombia. In 1866 he joined the regular army as colonel and next year was brevetted brigadier-general for gallantry at Fredericksburg, and major-general for meritorious conduct at Gettysburg. In 1865-67 he commanded the military district of the Carolinas, where he carried out the work of reconstruction with such vigor that Pres. Johnson relieved him of his command. In April, 1869, he was placed on the retired list of the U. S. Army with the full rank of major-general. In May of the same year he was appointed minister to Spain, which post he resigned in 1873, when he resumed his residence in New York City. There he holds the positions of president of the State board of civil service commissioners, and of the board for the erection of New York monuments at Gettysburg.

SIDGWICK, HENRY, an English philosopher, was born at Skipton, Yorkshire, in 1838. He was educated at Rugby and at Trinity College, Cambridge. He was fellow of the latter from 1859 to 1869, and in 1881 was elected an honorary fellow of the same. He was lecturer at this college from 1859 to 1875, and was then appointed prelector of moral and political philosophy. He has been prominently connected with the promotion of higher education of women at Cambridge, and especially in the foundation and management of Newnham College. He has contributed to the *ENCYCLOPEDIA BRITANNICA*, and to various reviews on philosophical subjects. He has published *The Methods of Ethics*, *Principles of Political Economy*.

SIEMENS, ERNST WEERNER, a German electrician, was born at Leuthe, near Hanover, December 13, 1816. He entered the gymnasium of Lubeck, and afterward the School of Artillery and Engineering of Berlin, becoming an artillery officer in the Prussian army in 1838. He afterward engaged ardently in the study of chemistry and electro-metallurgy, and in 1841 took out a patent for electro-plating and gilding. In 1844 he was placed in charge of the government artillery works at Berlin. He also de-

voted himself to the perfecting of electro-telegraphy, and in 1848 laid at Kiel the first wires for the explosion of submarine mines by electricity. In 1849 he left the army, and formed in Berlin the telegraph-building establishment of Siemens & Halske. This establishment has built the principal telegraph lines of Russia, Spain, Brazil, North Germany, and elsewhere. Siemens has been an active inventor, and has greatly advanced the science of telegraphy by his achievements in this direction. Among the most important of his inventions are a method of determining the position of injuries in subterranean and submarine cables, a method of examining insulated wires, and a method of charging underground and submarine cables by which the disturbing effects of induction may be reduced. In addition to these he has taken part with his brother, Sir Charles William Siemens (for whom see the *ENCYCLOPEDIA BRITANNICA*) in many of his important inventions, among them an improved steam-governor, an air-pump, a water-meter, a regenerative steam-engine, and a regenerative gas-furnace, the latter being an invention of the utmost value in metallurgy. He also joined with his brother in building the Indo-European telegraph in 1868-69.

SIEMERING, RUDOLF, German sculptor, was born at Königsberg in 1835, and was educated at the academy there. Removing to the neighborhood of Berlin, he became a competitor in designs for monuments to Schiller and to Goethe. Though unsuccessful, his designs drew attention to his merits. He completed a memorial of Albert the Great, and, later, a sitting figure of King William I. for the Berlin Exchange. The statue of Germany which was erected at Berlin to commemorate the mustering of troops there received some touches from his hand. His greatest work is the Luther-Memorial, which was unveiled on the 400th anniversary of the Reformer's birth, Nov. 10, 1883, at Eisleben. The statue represents Luther in the act of burning the Pope's bull. Four bronze reliefs exhibit other incidents from the life of the Reformer. In 1877 Siemering had erected at Marienburg a statue of Frederick the Great. He has also undertaken a memorial for the siege of Leipsic. His works are noted for their realistic truth. He especially excels in relief work.

SIGEL, FRANZ, a general of the American civil war, was born at Sinsheim, Baden, Nov. 18, 1824. He graduated at the military school of Karlsruhe, and served as an officer in the army of the Grand Duke of Baden, attaining the rank of adjutant in 1847. When the revolutionary movement of 1848 broke out, he resigned from the army and joined the insurgent forces, being appointed minister of war by the revolutionary authorities on June 1, 1848. He took part in the unsuccessful campaign against the Prussians, and after the defeat of Miroslawski Sigel skilfully led back the beaten and dispirited force and placed it safely in the fortress of Rastadt. On the dissolution of the provisional government he withdrew to Switzerland, but was not permitted to remain there by the Swiss government, and sailed for the United States, reaching New York in 1850. Here he taught mathematics for some years in the academy of Dr. Rudolph Dulon, whose daughter he afterward married, interested himself in military matters, and became major of the Fifth regiment, N. Y. militia. In 1858 he removed to St. Louis, became a teacher in the college of that city, and on the outbreak of the civil war received a commission as colonel of the Third Missouri volunteers, stationed at Camp Jackson.

The campaign in Missouri began with the active movements of General Lyon, who broke up the camp at Jackson, took possession of the United States arsenal at St. Louis, and defeated Colonel

Marmaduke at Booneville, thus checkmating the governor, who was planning to carry the State out of the Union. Sigel was sent on June 23d to southwest Missouri, where Price had collected a strong body of Confederate militia, and on July 5th met the enemy at Carthage, his 1200 men being opposed to 5000. A severe conflict ensued, ending in his repulse, but he conducted the retreat so skilfully as to check pursuit and inflict heavy loss upon the enemy. This repulse rendered it necessary for Lyon to take some decisive action, or to abandon that portion of the State. He preferred the former course and advanced rapidly to Sigel's support with about 5000 men, meeting the enemy, with more than twice that number, at Wilson's Creek on August 10th. In the engagement that followed Lyon was killed, and Sigel (now acting-general), who had been sent to gain the enemy's rear, met with a disastrous repulse. He conducted the retreat from Springfield, the Confederates having been too severely punished to make any vigorous pursuit. He now received a commission as brigadier-general, to date from May 17th. No further engagement of importance took place in Missouri, but the armies on both sides increased in numbers, and General Price, in command of the Confederate forces, was eventually obliged to retreat to Arkansas, whither he was followed, in February, 1862, by General Curtis with a Union army. On March 7th the armies met at Pea Ridge, the Confederates then under Van Dorn, and a severe battle followed, Van Dorn attacking with great energy before the Union lines had completed their formation. Curtis, however, held his ground, and gradually brought his men into position, Sigel, with the left wing, not reaching his designated ground until late in the night. The battle was renewed the next morning, and the victory was due to Sigel's skilful manœuvres. He pushed forward his line by alternate movements of batteries and infantry supports, pressing back the enemy's right until the Union lines formed a curve enclosing the enemy, when by a heavy concentrated artillery fire the latter were forced to retreat, and were finally completely routed. In this engagement the Union force was under 10,000; the Confederate, perhaps twice as strong. This was the last engagement of importance in that section of the Union.

Sigel's energy, skill, and success had now brought him into high repute with the German element of the population, and when in May, 1862, he resigned his position in consequence of unpleasant relations with General Halleck, the authorities at Washington showed their recognition of the value of his services by appointing him major-general, to date from March 21st. On June 2d he was placed in charge at Harper's Ferry, and on the 26th succeeded to the command of Fremont's army corps. He took part in the second battle of Bull Run, Aug. 29-30, 1862, and on Sept. 14 was made commander of the Eleventh army corps. In March, 1864, Sigel was placed in command of the department of West Virginia, and on Grant's advance against Lee he took part in the several co-operative movements ordered by the commanding general. His duty was to advance with the 10,000 men under his command, march up the Shenandoah Valley, and threaten the railroad communication with Richmond. In the accomplishment of this movement he was met by the Confederate General Breckenridge at New Market, on May 15th. Breckenridge made an impetuous charge upon Sigel's columns, and a sharp fight ensued, which ended in the Union forces breaking and flying in disorder up the valley, the Confederates pursuing and inflicting severe loss in men and materials during the 30 miles retreat. This ended Sigel's military career. He was immediately relieved of his command, and succeeded by General Hunter.

Since the war Sigel has resided in New York City, taking some interest in politics. In 1871, he was elected register of the city of New York. In 1886 he was appointed a pension agent.

SIGNAL SERVICE. Before the American Civil War General A. J. Myer, at that time a surgeon in the army, had already conceived a simple plan of communicating by signals between the soldiers and distant stations when the electric telegraph was not available. His plan was a modification of the Morse alphabet, and in place of dots and dashes he used a flag held in the hand of the signal-man, who, by waving it to the right for a dot and to the left for a dash, was thus enabled to spell out the letters of any word by signals that could easily be seen from one to twenty miles away, according to the clearness of the sky and the location of the observers. At night-time the waving of a lantern answered the same purpose; in fact, on special occasions, any signal whatever, such as a tap, an ejaculation, a wink given singly or doubly, and arranged in groups according to some previously concerted plan, afforded the means for distant communication. This simple idea, which was at first designed for immediate use between military parties scattered on the plains of the West and Southwest, found important application during the war which soon after broke out.

On the 21st of June, 1860, the Act making appropriations for the support of the army added to the staff of the army one signal officer, with the rank of major of cavalry. Subsequently, in recognition of the great services rendered by General Myer, the Act of June 30, 1864, gave him the title of Chief Signal Officer of the Army, with the rank of colonel, which rank was subsequently raised to brigadier-general (June 16, 1880), at which it still remains. During the war the important services of the many officers and men engaged under General Myer were freely acknowledged. At the close of the war, however, his staff was cut down to a small number, barely sufficient to maintain a school of instruction at what was then called Fort Whipple, now Fort Myer, on the Arlington estate near Washington, D. C. In the subsequent development of the work of the military signal office, General Myer properly and successfully maintained that the working of the electric telegraph for military purposes, the use of balloons and pigeons, and all other methods of communication at a distance were the proper work of his corps. The methods of building rapidly telegraph lines on the Western plains were so modified as to apply to the hilly and mountainous regions of the country, and when it became necessary to build such lines along the sandy sea-shore over the greater part of the distance from Boston to Key West, connecting together life-saving, lighthouse, and meteorological stations, the wooden pole was successfully replaced by iron tubes with a broad flange, which latter buried itself in the sand, forming a base for the whole. The field telegraph train, ready at a moment's notice to build ten miles of telegraph line, was the characteristic rallying point of the telegraph corps, as the kit of flags and torches was the emblem of the signal corps in general.

General Myer has often told the present writer of his various schemes for developing the further usefulness of the signal corps in times of peace as well as of war. Thus, at the time of the extensive riots of 1877, he kept the President informed by regular three hour reports of the state of the country at each of the 150 signal-stations. As his code and methods applied to the ocean as well as the land, he recommended its introduction into the Navy, and contributed greatly to the general introduction of the International Code. But his greatest triumph consisted in the utilization of the signal corps for the transmission of weather-reports to the

central office, and the dissemination thence of weather-predictions and signals that gave public warning of storms and daily weather-changes; it is this work that has made the Signal Service widely known throughout the civilized world. The importance and possibility of weather-predictions by means of the telegraph had been foreseen from the very first success of Prof. Morse on the line between Washington and Baltimore in May, 1854; reports had been collected and maps sent out daily by Prof. Henry at the Smithsonian Institution in 1854. European governments had then taken up the work and issued storm-warnings in Holland, France, and England. After peace had been restored in the United States Prof. C. Abbé, during 1853-63, had organized a system of reports and predictions for the benefit of the Cincinnati Chamber of Commerce, and, based upon his success, in the latter year Prof. Lapham, of Milwaukee, had caused memorials for a general national system to be endorsed by all Chambers of Commerce and Boards of Trade, which were then presented to Congress with a proposed bill by General H. E. Paine. As soon as the matter had been referred to the proper committee, General Myer appeared before it and explained convincingly the appropriateness of putting the work of weather-predictions and storm-signals in the hands of the Signal Service, which was officially done in February, 1870. The first bulletin of observations was issued by telegraph, Nov. 8, 1870, and occasional predictions were afterward made, it is said, by Prof. Lapham and General Myer, but systematic tri-daily was her-predictions began to be made by the present writer, February 12, 1871, and have continued unbroken from that day forward, excepting only that on July 1, 1888, reports and predictions began to be made twice instead of thrice daily. The scope of the work and duties of the Signal Service was at first confined to storms and floods, but has been successively extended to cover every important feature of the weather that can affect human industry, and it would be belittling its work to say, as has been said, that the agricultural interests receive the greatest benefits from it. Neither is its usefulness confined to the United States, since it exchanges reports by telegraph with Canada and the West Indies, and by mail with every civilized nation. The service has not merely a practical financial field of usefulness, but has also done good service in educating the people to a truer appreciation of science and the laws of nature. It has had to combat with the prejudices of the ignorant, who cling to the predictions of almanacs, astrologers, sun-spot men, and sensationalists like Wiggins; there is every evidence that at the present time the people look to the weather-signals, the weather-predictions, the weather-maps, the clouds, and the barometer, when they wish to foresee the weather, and have rid themselves of most of the superstitions that were formerly in vogue among the ignorant. Probably the most important feature of the service has been the remarkable promptness and rapidity with which it lays before the public its reports and predictions. A series of observations is made, for instance, as formerly, at 11.00 or 11.35 P.M., Washington time, simultaneously throughout the country; all necessary telegraph wires are put at the disposition of the service for 20 or 30 minutes until these observations are collected at Washington, they having meantime been also "dropped" at numerous other stations on their way. Being translated and put upon a map as soon as received, this work is finished before midnight, and before 1 A.M. all predictions, signals, and other orders have issued to the observers and to the Associated Press. By daylight of the next morning the public everywhere has received the morning paper with the predictions, or noted the storm-signals flying, or the cold-wave

signals displayed. In general, two hours, or two and a half suffice for the whole work of observing, predicting, and disseminating. Besides the tri-daily map, General Myer instituted the weekly weather-chronicle, the monthly weather-review, the tri-daily bulletin of observations, and the international bulletin of simultaneous observations taken throughout the world, accompanied by a daily map of the weather over the entire northern hemisphere, on the land and sea. After his death, August 24, 1880, a short interregnum occurred during which Adjutant-General R. J. Drum was acting chief, and Brigadier-General W. B. Hazen was then appointed Chief Signal Officer. During the latter's administration much attention was given to the enlistment of a better class of observers; to the introduction of civilian scientific experts; the improvement of instruments and of their exposures; the general inspection of the stations; the observation of atmospheric electricity; co-operation in international polar meteorological research; the introduction of uniform standard time; instruction in meteorology; the regulation of the finances of the service; the utilization of the homing-pigeon for military purposes; the initiation of cold wave signals, and of weather crop-bulletins.

During General Hazen's sickness, and after his death, January 16, 1887, General A. W. Greely, who had returned from his Arctic expedition, was temporarily in charge, and on March 3, 1887, was confirmed as Chief Signal Officer. His administration has thus far been signalized by remarkable energy in reducing unnecessary expenses, by his advocacy of at least a partial civilian organization under civil service rules, and by the securing of a new, convenient, and commodious building for the office in Washington in place of the disreputable, inconvenient houses hitherto rented for that purpose.

Notwithstanding the general success of the Weather Bureau as conducted by the Chief Signal Officer, there has been a long struggle over the question as to whether it would not be more appropriate as a civilian rather than a military organization: the general argument being that the young men who have enlisted as privates in the signal corps, expecting to devote themselves therein to meteorology, have been intellectually and socially too far above those ordinarily enlisting as privates in the army to justify holding them at the same rank; and again, that the work done is a practical and beneficial application of science, such that men who have devoted themselves to the study of science should be brought into the signal service more freely than is practicable so long as the strictly military organization is maintained. As the outcome of this long agitation of the subject the sundry civil appropriation bill, signed by Pres. Cleveland, Oct. 4, 1888, enacted that a very large proportion of those who have hitherto been carried on the rolls as privates and sergeants shall receive civilian appointments, a change which has immediately resulted in infusing a new spirit of ambition among those who have for so many years given their days and nights to the work of a service that is really an applied science, and not necessarily of a military nature. A further step is still urged by many members of Congress by which the Signal Office will remain as formerly a military branch of the army, while the Weather Bureau will become a bureau of the proposed Department of Industry, Commerce, and Agriculture.

(U. A.)

SIGOURNEY, LYDIA HUNTLEY (1791-1865), was a poet whose writings, by their religious tone and domestic sentiment, obtained an extensive but fleeting popularity. She was the daughter of Ezekiel Huntley, a veteran of the Revolution, and was born at Norwich, Conn., Sept. 1, 1791. She was well educated, and at the age of nineteen began to teach. In

1814 she removed to Hartford, where she conducted a school for young ladies. In 1819 she was married to Mr. Charles Sigourney, a merchant of Hartford. From her early contributions to periodicals her first volume, *Moral Pieces in Prose and Verse* (1815), was collected. More ambitious were her poems, *Traits of the Aborigines* (1822); *Zinzendorf* (1836); *Pocahontas* (1841), which showed an earnest effort to present the poetical aspects of American scenery and history. *Pleasant Memories of Pleasant Lands* (1842) was the record of a tour in Europe, during which some of her poems were published in London. In 1848 a collected edition was issued in New York, with illustrations by Darley. Altogether, as shown by her *Letters of Life* (1866), she wrote fifty-six books, some of which were intended for children, and several were biographical. She died at Hartford, June 19, 1865.

SILK. This article is confined to silk culture and manufacture in America. The effort to produce silk in America began very early in the history of the country. Cortez, the conqueror of Mexico, had eggs of the silk-worm brought to that country in 1531; he had previously planted mulberry-trees, to furnish food for the worms. The experiment was successful. Silk was produced, woven, and sent abroad. The industry, however, did not long flourish, and had almost vanished by the end of the century. Silk-worms were sent to the English colonies in 1619. James I. had been foiled in his efforts to establish the rearing of silk-worms in England, and sent eggs to Virginia, with an expert in their culture. He earnestly urged that silk should be produced instead of tobacco, against which he issued his famous *Counterblast*; bounties were offered to farmers who should produce silk, and penalties laid on those who should fail to plant mulberry-trees. The experiment at first promised well, but was soon neglected in favor of tobacco-raising. Some little silk was sent to England, but before the end of the century the industry died out in Virginia. The French Huguenots of the Carolinas were the first to introduce the silk manufacture into this country. They made silk-mixed goods, importing the raw silk for that purpose. Some silk was produced in the Carolinas, but no important quantity. John Law sought to introduce silk culture into Louisiana, as a part of his vast scheme for the improvement of that country, but the effort was unsuccessful. In 1732 the culture of the silk-worm was introduced into Georgia, and with more success than elsewhere in the country, under the stimulus of vigorous encouragement from England. In 1735 Oglethorpe took 8 lbs. of silk to England, which was woven into a dress for Queen Caroline. In 1750 a filature, or reeling establishment, was founded in Savannah. The exportations of raw silk grew until 1772, averaging 500 lbs. yearly, though rarely over 1,000 lbs. in any one year. In 1766 the culture reached its highest point, 20,000 lbs. of cocoons being produced, these yielding something less than 2,000 lbs. of raw silk. During the Revolution the product was made into sewing silk, and sold at home. The industry vanished soon after the war.

Silk culture began early in Pennsylvania, and silk was sent to England in 1726. It seems to have been somewhat active in Connecticut in 1732, and there is evidence that silk was woven there to some extent. The first coat and stockings manufactured from New England silk were worn by Governor Law in 1747, and the first silk dress by his daughter, in 1750. Efforts at manufacture were made elsewhere. In 1765 it was stated that within four days 100 silk-throwers had left England for New York and Philadelphia, with the purpose of establishing silk manufacture in those cities. Dr. Franklin wrote a

letter in 1770 strongly encouraging the silk-worm culture, and the planting of the mulberry. Silk manufacture in Connecticut became active after 1760, and for many years was carried on there more extensively than anywhere else in the United States. During the colonial period, and for many years after the Revolution, the manufacture was chiefly of sewing silk, and was largely a household art. The methods of reeling and twisting were very primitive, and much of the silk became tangled and wasted. In 1790 the manufacture of silk laces began at Ipswich, Mass., where it continued many years. Silk shoes are said to have been made. The making of fringes, coach laces, and tassels began at Philadelphia in 1793, and in 1815 silk trimmings were made in that city by William H. Horstmann. The manufacture of sewing silk by steam-power began in 1810. About 1825 the interest in the silk industry greatly increased. There was at that time a large importation of silk goods, and Peter S. Duponceanu (*q.v.*), president of the American Philosophical Society, brought the subject of the encouragement of American silk manufacture to the attention of Congress, established a small filature in Philadelphia, and exerted himself somewhat successfully for the advancement of the industry. Silk societies were established in several States, books on silk culture published, new machinery for silk manufacture invented, and a general interest in the subject awakened.

This interest led to an extraordinary development of speculation, which ended in checking the American silk industry for years. The worms had, up to this time, been fed on the leaves of the white mulberry (*Morus alba*), and some other plants. After 1830 a vigorous effort was made to introduce the Chinese mulberry (*Morus multicaulis*), on the ground of its rapid growth and abundant production of leaves. It was objected that it was not hardy, and not relished by the silk-worms like the white mulberry, yet a fever of speculation broke out, and the price of the tree went up rapidly, until cuttings reached an extravagant price. The excitement reached its height in 1839. People grew wild in their hopes of riches from the new tree, slender cuttings of 2 feet in length sold at from \$2 to \$5 each, and one nurseryman ordered 5,000,000 young trees from France, sending over \$80,000 as advance payment. In the autumn of 1839 the bubble burst. Thousands of the speculators were ruined. By the spring of 1840 trees could not be sold for 2 or 3 cents each. In 1844 most of those that remained were destroyed by a violent storm, and the white mulberries were widely blighted. Thus ended one of the most extraordinary outbursts of speculation in America.

Meanwhile the manufacture of silk goods was growing. Raw silk began to be imported from China, Turkey, and Italy in considerable quantities, improved machinery was invented, and by 1850 several firms had built up a good business in the manufacture of sewing silk and twist, some dress trimmings, and a few ribbons. From 1850 to 1860 the demand for sewing silk and twist increased, and it was found that the best American surpassed the best Italian in quality, evenness, strength, and color. The production of the machine twist in 1852 gave a great impetus to the sewing-silk industry, which has so advanced since that date as to free itself from foreign rivalry. The manufacture of woven silk goods now revived, and soon became of importance. About 1855 the manufacture of spun silk (now including almost every kind of silk goods) began at South Manchester, Vt. Silk ribbons began to be made in 1861. The industry was much stimulated during the war by the protective duty on manufactured silk and the free entry of raw silk. Paterson, N. J., "the Lyons of America," had 40 or 50 silk factories,

and others started in many places. Plain gros-grain dress silks were made by 1866, and brocaded silks and satins were attempted on a large scale even earlier. The manufacture of silk laces was established at Brooklyn in 1871. That of handkerchiefs was of slow growth till 1876, when it received a remarkable impetus from the Centennial Exposition, which indeed aided the silk industry generally. The manufacture of various other kinds of silk goods was attempted; silk trimmings became a very large branch of the industry, while silk tapestry and velvets were introduced as new branches of manufacture. A great advance was made in the production of dress silks of every color and variety, the American goods of this kind surpassing French goods of the same grade, and selling at lower prices. In 1874 the silk goods manufactured in the United States were valued at \$16,269,157. By 1880 they had increased to \$34,519,723. There has been a steady increase since.

The production of raw silk in this country by no means kept pace with this progress. Since the *Morus multicaulis* excitement the silk product has not been an observable element in the manufacture. Silk culture began in California in 1854, and gradually grew until it became a mania, but has died away again and is now almost extinct. In the census year 1880, the amount of silk produced in the United States was too small and scattered to be estimated, while the importations of raw silk reached 2,562,236 lbs. The Woman's Silk Culture Association of Philadelphia was founded during the Centennial Exposition, and has made active efforts to arouse interest in the industry, but as yet with slight success. Other associations are the Kansas State Silk Station at Peabody, and the State Board of Silk Culture at San Francisco, each of which is endeavoring to awaken interest in the industry at their respective localities. It has also been actively taken up by the Agricultural Department at Washington, where a filature for the reeling of silk from American cocoons was established in 1886. Cocoons were purchased from the three associations above named, but so far the cost of the experiment has been greater than the value of the product. It is continued, however, with the hope of more success. Eggs of the large Milanese variety of silk-worm are being distributed by the department, from which good results have been obtained. The history of silk production in America, however, is not one to encourage any extravagant hopes in that direction, the industry never having proved sufficiently profitable to largely enlist American interest. (C. M.)

SILO. See ENSILAGE.

SILVER, a precious metal which, more than any other, is found in combination with different substances, as sulphurets, oxides, and other metals. It occurs in several geological formations, widely separated in age and locality, and is therefore very generally diffused. Of mineral ores experiment has proved that only one in seventeen is free from silver, while minute traces of it exist in sea-water and in organic substances. Gold never occurs in nature unassociated with silver, and the latter is said to be never wholly free from gold. It is, indeed, more commonly found in connection with gold and lead than with any other minerals. Yet, despite this combination, there is a natural distinction between the veins of the several metals. In Nevada, Arizona, and New Mexico, for instance, the prevailing ores of precious metal are distinctively silver, the gold usually occurring in minute particles entangled in the sulpho-salts of silver and other metals, the weight of silver being greatly in excess of that of gold. On the other hand, in the California gold-belt gold occurs as flakes or even masses with only a small percentage of sil-

ver alloy. The main sources of the world's supply of silver for two hundred years after the discovery of America were Mexico and South America, but the mining enterprise of the United States within recent years has developed vast deposits in the mountains of the Pacific slope, and the yield of this country is now considerably in excess of that of any other.

Of the silver-producing fields of the United States the valuable mines of Nevada are situated on the eastern slope of the Sierra Nevada Mountains, nearly opposite to the centre of the California gold deposits on the western slope. Here, much to the surprise of prospectors, were found vast deposits of ore, which quickly dispelled the formerly prevailing theory that silver exists in the United States only in small quantities in connection with other ores. In 1859 two prospectors, Comstock and Jenrod, found on Mount Davison, near the shelf on which Virginia City is now built, what seemed "a vein of very dark ore." Specimens of this were sent to San Francisco for assay, and proved to be quartz rich in silver. The news of this discovery quickly spread, and miners flocked to the new silver locality in multitudes, the whole mountain being soon staked out in claims. Of the several veins that were opened, the richest was that since so well known as the Comstock. Here the dip of the ore is almost perpendicular, and the expense of working the vein has proved very great. Other veins of silver ore run parallel to this along the eastern slope of the mountain, there being several such belts of ore which are nearly one thousand feet long and have been traced nearly four miles in different directions. In some cases these veins have been reached by horizontal drifts in the mountain-side, their great dip rendering this feasible.

During the period since the opening of these mines about \$300,000,000 in value of silver have been taken from them, though recently there has been a decided falling off in the output of the Comstock lode. As the depth of the workings made the requisites of ventilation, pumping, and raising the ore very expensive, it was decided to excavate a draining and ventilating tunnel to the several veins. This has been accomplished by the remarkable Sutro tunnel, which enters the mountain-side 2000 feet below Virginia City, and is 14 feet wide, 12 high, and nearly 5 miles long, with numerous lateral galleries. Along it passes a double-track tramway to carry out the ore, with water-drains on each side, while the mines, once almost unbearable in temperature, are now cooled and ventilated. There are several other silver-mining localities in Nevada, Enreka being an important one, and the silver yield of the State is about three times its production of gold.

The mines of Arizona were first discovered about 150 years ago by adventurous priests who brought to Mexico marvellous tales of the wealth of native silver in the mountains of the North. Multitudes of Spanish adventurers flocked to this locality, and worked the mines for nearly a century, at the end of which time the Indians, whom they had forced to work for them, rose and drove them off. When the United States obtained possession of Arizona there were no mines in operation, the Apache Indians having full control of the country. These savages gave great trouble to the early American miners, yet the old Mexican mines were gradually opened, and worked successfully, while new discoveries of rich deposits, often of almost pure silver, were made. The richest deposits of Territory are near the town of Tombstone, where high-grade and easily worked ores exist abundantly. The mineral belt of Tombstone is about 8 miles wide, from east to west, and 25 miles long, embracing an area of nearly 200 square miles. Hither miners have flocked in numbers, and the veins have been extensively worked. About 200 miles easterly from Tombstone, in the Lake Valley

See Vol. XXII.
p. 69 (p. 76 Am.
Rep.).

mining district of New Mexico, exists another remarkable deposit, whose ores are said to be very rich and abundant. At various points in the Valley of the Rio Grande are other silver-ore veins, and the indication is that the whole region of Western New Mexico and Eastern Arizona is rich in metallic veins.

Nearly due east from the rich silver deposits of Nevada, and about eight hundred miles distant, exist the mines of Leadville, Colo., the most productive silver mines yet opened in the United States. These are in the Rocky Mountain region, and the ore differs from that of the Sierra Nevada by being associated with lead instead of gold. The lodes here are comparatively horizontal, and operations much less expensive than at Virginia City, so that the mines are worked to a much greater extent by individuals and by companies of small capital. The product of the United States hitherto has been principally from these two regions, though of late years the Nevada yield has fallen off and that of new regions grown into great importance.

Of these newer localities may be particularly named Utah and Montana. The latter Territory is now second in product to Colorado, it having several valuable mining districts, the richest in silver being the Granite Mountain, the Anaconda, and the Alice mines. In Utah, which now comes third in silver product, the veins are scattered over the Territory, though much the richest deposits are in Summit County, the Ontario mine being now the principal producer, the Horn Silver mine, once a strong rival, having dropped from competition. The silver here is in connection with lead, as in Colorado. Idaho has rich silver deposits, in combination with gold. In Wyoming the gold is more promising than the silver, in one locality the silver being connected with copper, below which are veins of native silver, and still farther down silver and gold combined. There is probably very little silver in Oregon and Washington, and no promising show in California, nearly all the silver from that State coming from the mines of San Bernardino County. One-third of all the gold and one-half of all the silver annually produced in the world are supplied by the mines of the United States. The mining laws of the United States permit miners to go upon the public domain and work mines without restriction or payment of royalty. This is different from the custom of other governments, and unfair to the interests of the remaining people of the country, yet it has had much to do with the remarkably rapid development of our rich mineral resources.

The value of the output of the principal silver-producing States and Territories and of the whole United States for the year 1886 was as follows:

Colorado.....	\$18,209,406	California.....	\$1,610,025
Montana.....	13,849,920	Dakota.....	423,581
Nevada.....	6,051,596	Idaho.....	94,023
Utah.....	5,539,940	Other States and	
New Mexico.....	2,701,741	Territories.....	110,873
Arizona.....	2,305,420		

Total United States product..... \$50,506,124

The following table gives the production in the silver-yielding countries of the world for 1887:

United States.....	\$51,600,000	Russia.....	\$646,424
Mexico.....	32,111,774	Argentine Repub-	
Bolivia.....	16,000,000	lic.....	478,075
Chili.....	6,649,000	Italy.....	432,140
Germany.....	5,915,600	Africa.....	362,218
Spain.....	2,258,163	Great Britain.....	316,021
Austria-Hungary..	2,090,900	Norway.....	290,212
Peru.....	1,987,500	France.....	245,412
Australia.....	1,048,379	Brazil.....	169,500
Japan.....	959,413	Sweden.....	96,697
Colombia.....	760,000	Turkey.....	55,420

Total world's production..... \$121,422,342
(C. M.)

SIMON, JULES, a French statesman and philosopher, was born at Lorient, Dec. 27, 1814. His family name was Suisse, but from childhood he bore the name Simon, by which his father had come to be known. His early studies were at the college of his native town and afterward at Vannes, and he had already taught at Rennes before he attended the Normal School at Paris in 1833. Having taken his degree in philosophy in 1833 with a thesis on Proclus, he taught at Caen and Versailles. Then he was recalled to Paris by his former master, the distinguished Cousin, whom he succeeded at the Sorbonne in 1839. For twelve years his lectures were attended by enthusiastic students, till the *coup d'état* of 1851 caused them to be suspended. To this early period of his career belong his treatises on ancient philosophy, *La Théodicée de Platon et d'Aristote* (1840), and *Histoire de l'École d'Alexandrie* (2 vols., 1844-45); his editions of the French philosophers, Descartes, Bonnet, Malebranche, Arnauld; and a *Manuel de Philosophie* (1847). Denied under the Empire an opportunity of teaching, he began in 1855 to conduct courses in philosophy in the principal cities of Belgium. These proved highly successful and gave him a wide reputation. His visits to Belgium also had a favorable effect on his mind, by showing him the practical effects of religious liberty. His lectures of this time furnish the material of his books, *Le Dénier* (1854); *La Religion naturelle* (1856); and *La Liberté de Conscience* (1859). A larger work, *La Liberté* (2 vols., 1859), he subsequently divided under the titles *La Liberté de Penser* and *La Liberté civile*. When the Empire seemed to have become established the government's pressure was relaxed. In 1863 Simon was elected to the Corps Législatif, and soon became the leader of the Republican party. This position was due not merely to his ability as an orator but to his intellectual force. He sought to base political acts on philosophical principles. These he commended to the people in a number of treatises, in which he discussed the questions of labor, compulsory education, and the various elements of the radical policy. The general elections of 1869 showed the advance of his popularity and of the Republican party. His name was proposed in several departments, and he was elected in two. The Republican opposition to the declaration of war against Prussia could not prevent Napoleon III. from rushing on his fate. After the downfall of the Empire, Simon took part in the government of the national defence, the ministry of public instruction being appropriately assigned to him. Too moderate to suit the communistic tendency of Paris, he failed of election there in February, 1871, but was chosen from Marne. In President Thiers' cabinet of that year he was again minister of instruction. His wise measures gave a beneficial impulse to both primary and higher education. When in May, 1873, Marshal MacMahon succeeded to the presidency, Simon, in the Corps Législatif, became the leader of the Constitutional Republicans. To him may be ascribed the defeat of the combined attempts of Bonapartists, Orleanists, and Legitimists for the restoration of monarchy in the following autumn. In 1875 he was elected a senator for life, and on the same day a member of the Academy. Thus, as the witty French expressed it, "One day rendered him irremovable and immortal." His aim at this time was to unite all the Republican groups, but the Radical tendency was too strong. In December, 1876, Marshal MacMahon yielded so far as to call Simon to form a cabinet. In this he had the portfolio of the interior. The marshal again yielded so far as to dismiss from office some who were obnoxious to the Republicans. But in the severe struggle which soon arose with the clericals, the Marshal-President favored them, and found in a trifling accident an opportunity to ad-

minister a public rebuke to Simon. The latter therefore resigned, May 16, 1877. In the following September, after the death of his friend Thiers, Simon pronounced his eulogy. The reactionary MacMahon resigned and the true Republican Grévy succeeded to the presidency. Simon was selected to lead the movement for the transfer of the seat of legislation from Versailles to Paris. Still a firm but moderate Republican, his prudent conservatism brought him into conflict with the progressive Radicals. He resisted the effort to exclude the religious orders from the work of education, and to banish the non-authorized bodies from France. He also resisted the movement for complete amnesty to the Communists of 1871. The Academy chose Simon in 1880 a member of the supreme educational council. In 1882 he was made permanent secretary of the academy of moral and political science.

Simon's philosophic works and his earlier political and economic writings have already been mentioned. After the establishment of the Republic he published some treatises on education and historical memoirs. These comprise *Souvenirs du 4 Septembre* (2 vols., 1874), relating to the downfall of the Empire and the government of the National Defence; and *Le Gouvernement de M. Thiers* (2 vols., 1878). Besides a manual of civics for schools, *Le Livre du Petit Citoyen* (1880), he published *Dieu, Patrie et Liberté* (1883), in which he set forth, with characteristic eloquence, the great moral ideas which have ruled his life.

SIMPSON, MATTHEW (1810-1884), a bishop of the Methodist Episcopal Church, was born at Cadiz, Ohio, June 21, 1810. After graduating at Madison College, Hamilton, N. Y., he taught there for a time. In 1837 he was called to be professor of natural science in Allegheny College, and in 1839, after he had entered the ministry, he was made president of A-bury University, Indiana. As a delegate to the General Conference of 1841 he took part in the controversy on slave-holding which divided the Methodist Church. At the Conference of 1848 he was made editor of the *Western Christian Advocate*, and at the next Conference, in 1852, was chosen bishop. His residence was fixed at Philadelphia, but he spent much time in foreign journeys, one of which extended around the world. His visit to the British Wesleyan Conference in 1863 gave him an opportunity to plead effectually abroad the cause of the U. S. government in regard to the civil war, as he had already done at home. In this cause his oratorical abilities received wide recognition, yet he never neglected his work as bishop and preacher of the Gospel. President Lincoln treated him with marked cordiality, and the Christian Commission had in him a warm advocate. In 1881 he was one of the leaders in the Methodist Ecumenical Conference at London. He died at Philadelphia, June 17, 1884. He published a *Hundred Years of Methodism* (1881), *Lectures on Preaching* (1883), and a *Cyclopedia of Methodism*.

SIMS, JAMES MARION (1813-1883), physician, was born in Lancaster district, S. C., Jan. 25, 1813. He graduated at South Carolina College in 1832, studied medicine in Charleston and Philadelphia, and began practice at Montgomery, Ala. Having made a specialty of diseases of women, he established a private hospital for the purpose, which proved eminently successful. In 1853 he removed to New York City, where he urged the necessity of such a hospital, and had the satisfaction of seeing it opened in 1855. Dr. Sims had already invented the vaginal speculum and made improvements in surgery which gave him international fame. On his first visit to Europe, in 1857, his professional brethren showed their respect by asking him to perform important surgical operations. For some years he resided in Paris, and in

the War of 1870, he organized an ambulance corps. He returned to New York soon afterward, and died there Nov. 13, 1883. His publications were chiefly professional, and after his death a volume called *The Story of My Life* appeared, edited by his son (1884).

SIOUX, the principal tribe of the Dakota family of Indians, were called by Father Hennepin (1680), Nadouwessians, and by Captain Carver (1766), Nadouessioux. This was the name given to them by the Algonquins, and meant "enemies." Their own name, Dakota, meant "confederates." For their general character and customs, see DAKOTA INDIANS. In 1815 the U. S. government first negotiated with them, making three treaties with three separate bands. In 1825 four treaties were made. The Ojibways, or Chippewas, were then steadily forcing the Sioux southward and westward. In 1830 the latter made to the U. S. government their first cession of lands, between the Mississippi and Des Moines Rivers, and were to receive certain annuities, to be divided between the different bands. Soon after this the artist Catlin visited them, and painted portraits of their chiefs. He speaks of them in terms of high praise. In 1837 thirty Sioux chiefs visited Washington and ceded all their lands east of the Mississippi for the sum of \$300,000, the interest of which was to be paid annually, while other sums were devoted to paying the debts of the tribe and giving them an outfit for civilized life. The effort to turn the Sioux from hunters into farmers was not successful, probably owing to the agents employed as well as the character of the Indians themselves. They were demoralized by the introduction of whiskey, and were constantly attacked by other tribes. In 1849 a new cession of their lands in Minnesota, west of the Mississippi, was made. At this time arrears of interest due them by treaty amounted to \$50,000. The half-breeds made efforts to have assignments of land made to them in severalty and in fee-simple, but the government refused. Treaties, however, were made in 1851 by which many millions of acres forming "the garden-spot of the Mississippi Valley" were relinquished for a few cents per acre. The largest part of the price was to be held in trust, and the interest paid to the Indians for fifty years. Governor Ramsey, of Minnesota, estimated the actual cost to the government to be \$575,000. The four great bands of the Sioux, then numbering about 8,000, were to be brought together on one reservation, and a brilliant future was promised them. They had already made some progress in agriculture and education. It soon appeared that the government intended to remove them to other places at the end of five years, and hence their disposition to improve the land of the reservation was checked. In 1854, however, this impediment was removed and they were assured of a permanent home. In 1857 serious trouble was threatened and with difficulty avoided. Some Sioux who had been driven out of the tribe long before got into a quarrel with a few whites, attacked a settlement, and killed the inhabitants. The great body of the tribe, though discontented on account of the non-payment of the annuities, and regarded with suspicion and hatred by the whites, pursued and killed or captured the offenders. The excitement passed away, and soon most favorable reports were received of the progress made by the Sioux in learning civilized ways. But their annuities were still delayed until in August, 1862, some desperate, famishing men broke into a government warehouse. In a few days their numbers increased, and they began to massacre white settlers. Friendly Indians were threatened with death if they did not join the savages. Nevertheless, many of them rescued white families, and gave shelter to women and children. The hostile bands roamed over the country and compelled the abandonment of a district 200 miles long and 50

miles wide. A thousand whites were killed in the war and millions of dollars' worth of property was destroyed. Gen. Sibley conducted a successful expedition against the Indians. Hundreds of them were captured, and many voluntarily surrendered. A military commission sentenced 300 to be hung, but only 39 were executed. The friendly part of the tribe, who had to be protected from the indiscriminate fury of the whites, had been placed in a barren district in Dakota, where they endured privations for three years. Many of the hostiles escaped into the British dominions and settled there. The campaign had cost the government \$40,000,000. In 1865 resort was had again to peaceful negotiation, and nine treaties were made with as many different bands of Sioux. In 1866 the friendly Indians were removed from Dakota, and carried about almost every year to a new locality. For ten years the policy of the government wavered between severity and kindness, while the Indian and the War Departments disputed where the blame should rest. About 1870 the Santee Sioux began that change for the better whose results are shown in the article on INDIANS, Vol. II., p. 401. Near the northern border of Dakota, Sitting Bull and others had remained in hostility. The failure of the government to send supplies to the agencies caused many young men to join the hostile camps. In 1876 war began again, and its most appalling incident was the massacre of Gen. G. A. Custer and his command on June 26th. In October Col. Miles had effected a complete defeat of the Sioux, but Sitting Bull escaped into Canada, and scornfully refused to return when invited. The government then decided to re-establish the Sioux, to the number of 14,000 souls, on the Missouri River. Between 1863 and 1879 the Ogallalla Sioux were moved eight times. Their present condition is shown in the article INDIANS. See also the *Reports of the Commissioner of Indian Affairs* for various years; Mrs. H. H. Jackson's *A Century of Dishonor* (1881); Col. G. W. Manypenny's *Our Indian Wars*.

SIOUX CITY, the county seat of Woodbury Co., Iowa, is on the east bank of the Missouri River, between the mouths of the Floyd and the Big Sioux Rivers, 125 miles above Omaha. Five trunk-line railroads pass through the city, and several branches start from it. A railroad bridge 2000 feet long here crosses the Missouri. Sioux City has a court-house, city hall, hospital, 2 large hotels, 8 banks (3 National) with combined capital of \$2,000,000, 27 churches, and good public schools. It has a linseed-oil mill, 2 flouring mills, vinegar works, spice mills, soap factory, planing mills, and sash and door factories. With the Union stock-yards are connected large packing-houses, capable of packing 14,500 hogs and 2000 cattle daily. The total trade of the city for 1887 was \$8,500,000. The city is 1,100 feet above the sea-level and has a total area of 30 square miles. It has 60 miles of graded streets, 15 of which are paved with cedar blocks. There are 12 miles of street railway, and a good system of sewerage. The property is assessed at \$8,000,000; the public debt is \$486,000, and the yearly expenses exceed \$135,000. The city, laid out in 1854, was made the county seat in 1856, and was incorporated in 1857. Sioux City in 1880 had a population of 7336, but has since grown rapidly.

SKEAT, WALTER WILLIAM, an English etymologist, was born in London, Nov. 21, 1835. He was educated at Highgate School, London, and at Christ's College, Cambridge, where he graduated in 1858. He studied theology and was ordained in 1859, and held two curacies. In 1864, being laid aside from clerical work by diphtheria, he edited *Launcelot of the Laik* for the Early English Text So-

ciety. Other works followed, and Mr. Skeat began to prepare a glossary for the various works he had examined. He also edited Barbour's *The Bruce*, Chatterton, and the Anglo-Saxon Gospels. He founded the English Dialect Society in 1873 and directed its labors for three years. His most important work is the *Etymological English Dictionary* (1880).

SKENE, WILLIAM FORBES, a Scottish historian, was born at Inverurie, Kincardineshire, June 7, 1809. He was educated at the Edinburgh High School and at the Universities of Edinburgh and St. Andrew's. He became a writer to the signet, and devoted much attention to historical and antiquarian research. Besides several monographs, he has published *The Highlanders of Scotland: their Origin, History, and Antiquities* (2 vols., 1837); *Celtic Scotland, a History of Ancient Alban* (1876-80). The latter is in 3 volumes, treating respectively of the History and Ethnology, Church and Culture, and Land and People. Mr. Skene also edited the early Scotch historians. His labors have thrown much light on what was formerly obscure and confused in the history of Scotland.

SKINNER, THOMAS HARVEY (1791-1871), Presbyterian minister, was born in North Carolina in 1791. He graduated at Princeton in 1810, and was made copastor with Dr. T. L. Janeway, in Philadelphia, in 1812. Four years later he withdrew with part of the congregation and formed the Arch Street Presbyterian Church. He was afterward professor of sacred rhetoric in Andover Seminary, and in 1835 became pastor in New York City. In 1848 he was made professor in the Union Theological Seminary, and held this position until his death, Feb. 1, 1871. Among his publications, besides sermons, were *Preaching and Hearing and Discussions in Theology*.

His son, bearing the same name, was born at Philadelphia, Oct. 6, 1820. He graduated at the University of the City of New York in 1840, and was ordained pastor of a Presbyterian Church at Paterson, N. J., in 1843. He afterward held charges in New York City, Honesdale, Pa., Stapleton, L. I., Fort Wayne, Ind., and Cincinnati. He was called thence to be professor of didactic and polemic theology in the Presbyterian Theological Seminary of the Northwest.

SLANG. See AMERICANISMS.

SLAVERY, in the most general sense, implies a relation between persons under which the conduct of one is subject to control by another in a manner unlimited, except under some source of authority or necessity external to the relation. Where the form and qualities of that relation are prescribed by a system of laws to which the parties to the relation are subject, the term slavery expresses an institutional idea that transfers the sanction of the rights and obligations incident to it from what is involved in the relation itself to the system of laws under which it exists. It is in this institutional sense that the term is ordinarily used, and is here employed. We are to consider slavery as a civil institution, either intended to advance the general social objects for the sake of which governments are organized, or remaining as a survival of antecedent unorganized conditions, and in this light to examine the characteristics of that type of the institution that became domesticated in America, but which has now disappeared from the United States, and from nearly the entire continent of America.

The slave relation is, according to the general estimation of the law of Europe and America, based upon an obligation on the part of the slave to exercise his entire capacity of labor and service for the benefit of the master, and under his direction, without compensative return. On the other hand, the

master was regarded as bound to supply to the slave the simplest and least costly means of supporting his capacity for labor, in the form of shelter, clothing, and food, while under no obligation to promote the conditions for the development of those higher powers that are dependent upon mental culture. The means for compelling conformity on the part of the slave with his obligations were abundantly provided by the law, as the master was permitted to exercise the full extent of the coercive and punitive power required for that purpose. On the other hand, the means afforded by the law for compelling the master to perform the obligations incumbent upon him, as incidental to the relation, were wholly inadequate to satisfy the idea of justice as applied by those systems to all other classes of persons. In the most advanced communities that recognized the system, only the most aggravated disregard of his obligations, on the part of the master, and such acts as shocked the sense of the community, as gross departures from what was sanctioned by its common habits, were the subjects of legal inquiry or redress. Taking the life of a slave, or subjecting him to tortures tending to impair his capacity for labor, was clearly not means appropriate to secure from the slave the proper application of his powers to the service of his master, and accordingly such acts were discountenanced and frequently punished. But, although the law thus intervened for the protection of the slave, the wrongs done to the community were the only ones redressed, the slave receiving no compensation for what was unlawfully denied or inflicted upon him. Had the systems maintaining such relations between the master and slave regarded the slave as a mere object of property, such as a domestic animal, the absence of any attempt to extend the principles of justice to ameliorate the conditions of the slave might be accounted for; but such was not the case, for slaves were regarded as persons, and although not entitled to the privileges that were enjoyed by all other persons, were frequently held accountable for their conduct, as bound by the same obligations that affected all others.

The most striking feature of the slave system is the fact that it removed from the social mass of the slaves the germ from which all institutional forms and organisms spring—the family. The uncertain tenure by which the slave family cohered, being liable to dissolution at the caprice of the master, or as his necessities or interests might require, prevented that stability in domestic relations without which social development is believed to be impossible. The family may be regarded as the organic unit of society from which all other institutional forms are derived by differentiation, just as the leaf supplies the same function to vegetal growth, and if the bud, which is the incipient leaf, is suppressed, development is impossible. When slavery theorized at all it regarded the family of the master as including all the persons subject to his authority, and as displacing all subordinate family groups, referring the idea to the patriarchal practices. The effect of this was to remove the conditions of development from the inferior mass, and to leave only the possibility of advance as an adjunct of the superior system.

It appears, then, that the characteristic feature of slavery was that it deprived the social mass, represented by the slave, of the capacity of development from its own internal conditions, while at the same time it placed that mass in such imperfect communication with the superior civilization that the benefits possible from such contact could not be realized. It is observed, of all relations between social bodies, that the first step toward interchanging whatever either may possess to the advantage of the other is to establish justice between them, and this is as true of the interchange of ideas and habits as it is of

merchandise. As, then, the same principles of justice that were recognized in the relations existing between the members of the superior civilization were not extended to the intercourse with the inferior, it was against natural tendencies to expect that the relation between the civilization of the master and the unstratified social condition of the slave should produce other than small results for good upon the condition of the latter.

Slavery as it existed in America was not a general system such as might be applied equally to all persons standing in like conditions, but was what might be called a personal system, being a relation between the white man and a particular race of people, namely, those of African descent. Although the spirit of our laws was dictated by the spirit of liberty that all mankind should stand together in the same civil society under laws affecting all alike, who were in like conditions, yet for some reason we have excepted from the benefits of that system the African people of this country who were held as slaves, and have given no satisfactory reason for that exception, although, in order to commend that system in the estimation of peoples who have not accepted it, it would seem to be required that such reasons should be given in a satisfactory form. We can say that certain facts did not afford the reason of such exception. For instance, it was not the fact of difference from our race and color, for other races differing in these respects from us were not excluded from the benefits of our system of laws. It was not the undeveloped condition of the African, for other peoples equally undeveloped have been admitted to the privileges of our laws. It was not that the African had thrust himself into our society unfitted for association with us, and to be isolated as a means of compelling him to withdraw from us, for we had brought him here against his will, and had paid for the privilege of so doing. There is no other mode of accounting for the anomaly but on the ground that the African was procured as a profitable investment of money in a cheap instrument of industry.

The African slave first came to the soil of the United States from the West Indies, where he had been introduced as an object of traffic. No doubt, when the opportunity presented itself for supplying with labor a country that abounded with natural resources but lacked laborers, a humane as well as a thrifty motive affected the people of our country, prompting them to accept the advantages of the system. The deplorable condition of the African slave, both in his own country and in the West Indies, appealed to the humane sympathies of our ancestors, who saw an opportunity of getting gain and doing a godly act for the oppressed in getting them better masters, and a chance for attaining to a higher condition of manhood.

From being a convenience the slave became a necessity, in a semitropical region, especially as connected with the rice-culture, that was fatal to the white laborer. By the time that the convention of 1787 was held to frame the Constitution of the United States the sentiment as to the status of the slave had changed somewhat. Where he was not a necessity of industry the old humane feeling prevailed, as evidenced in the debates in that convention, but where climatic causes made him a necessity the humane sentiment had been largely displaced by economic ideas. This consequence follows wherever thrift and humanity are combined motives to action, the dominant force remaining invariably in the hands of the former. These two motives, the one derived from the force of humane ideas, and the other from economic promptings, were destined to be arrayed against each other in a prolonged struggle in which the higher principle would ultimately prevail.

At the foundation of the government of the United States the conflict was already formulated in its incipient stages. England had already, through her judiciary, declared that slavery could not exist under the laws of that country, thus emphasizing that aspect of slavery that concerned its relations to the principles on which the higher form of organized government depended. The question of its humanity became involved with that of its effect upon the condition and objects of government, as interpreted from the principles of liberty.

The history of the development of American slavery is the history of its territorial extension, for as a social system it exhibits no progressive steps of advance toward anything that may be esteemed as the ideal of the system. Had there been any possibility of its taking on a character in harmony with advancing conceptions of society, American faculty would doubtless have found the means of advancing toward that result. The inability of American ingenuity to raise the institution of slavery from a lower to a higher plane emphasizes the conclusion that it is to be regarded as a survival of savagery capable of no permanent place in the scheme of civilization, but destined for elimination. The history of slavery in the United States exhibits a dual contest, on the one hand for its territorial extension in order to entrench it in popular interest and favor, and on the other to eliminate it from the system of the country.

The cession by Virginia to the United States of the territory northwest of the Ohio River brought the subject of the extension of slavery over the territories into active discussion. This cession was followed by the ordinance for the government of the Northwest Territory, that declared that slavery should be forever excluded from that territory. This ordinance, speaking as it does the sentiment of the people of the United States, condemns in effect the institution of slavery as unsuited to harmonize with the spirit of American liberty, and as justified where it should continue to exist by local causes alone. Unless the ordinance can be interpreted in this sense it cannot be rationally interpreted at all.

The Constitution of the United States, framed in the same year with the ordinance just mentioned, 1787, declares that Congress should not interfere with the migration or importation of such persons as the States should see fit to admit prior to the year 1803.

It has never been questioned that this had reference to interference with the African slave-trade, but was masked under this form out of decent regard for the opinions of mankind. This provision was clear authority for Congress, after the year designated, to prevent the introduction of slaves into the United States and to prevent their migration from State to State and into the territories. That Congress had after that time such authority as to the importation of slaves was never seriously questioned, but that Congress could prohibit the owners of slaves within a State from migrating with his slaves into the territories of the United States was resisted so long as the slave-holding States could influence the course of public action. The necessary implication from this clause is that the slave-trade was regarded as a necessary evil that must be endured for a time for economic reasons, after which it would be regarded as a crime to do that the doing of which was the occasion of the existence of slavery in this country. There was also in the provisions relating to migration a clear implication of a policy of limiting the area of slavery, which could only be extended by such migration.

The Constitution also contained a provision making it the duty of some public authority to return

slaves escaping from one State into another to the State from which they came, but the authority by which such return was to be accomplished was not pointed out. Upon the principles of strict construction for which the slave States always contended, this duty devolved upon the States, as no express authority was conferred upon Congress for that purpose, and as Congress, according to that view, could not take substantive powers by implication but only such as are in aid of the enumerated powers, as necessary to their exercise. The power of rendering fugitive slaves was not in the class of the enumerated powers, and was not in aid of any enumerated power. Although inconsistent with the principles which they applied to the construction of the Constitution, the party of strict construction in later years claimed that this power and duty devolved upon Congress, and actively procured the adoption of a fugitive-slave law in conformity with that view.

The first Congress assembled under the Constitution re-enacted the ordinance for the government of the Northwest Territory with the same exclusion as to slavery that existed in the previous ordinance, reiterating the implications already pointed out.

North Carolina in 1787 ceded her Western lands to the United States, with a provision that the slaves within that territory should not be emancipated. The cession by Georgia of her lands west of her boundaries followed in 1802, without any clause excluding slavery.

The condition attached to the cession of North Carolina tied the hands of Congress as it regarded slavery within the region ceded, but not more effectually than they were tied by the state of parties in the Union through the large influence of the slave-holding States, making the absence of such a condition in the Georgia cession a fact of no importance.

The purchase of Louisiana, consummated by President Jefferson in 1803, opened wide the door of controversy to the parties that respectively supported and antagonized slavery. The territory thus acquired supported the institution of slavery, and was largely subject to the same climatic conditions that had caused slavery to become deeply rooted in some of the Southern States.

Slavery was taking a new phase, and assuming definitely an aggressive rôle in the interest of its territorial extension. The invention of the cotton-gin had rendered the separation of the fibre of cotton from the seed an inexpensive process, instead of a laborious and expensive one, as it had theretofore been. The culture of cotton in the United States, from being an experiment, passed into a great industry that revolutionized not only the industry of the Southern section of the Union, but its political condition as well. Slave labor was regarded by the cotton States as indispensable to the success of that industry, and the perpetuation of slavery was the leading tenet of the new doctrine. The advocates of slavery found it necessary to strengthen the position of the slave interest on two sides, the moral and the political. It was habilitated as a patriarchal institution commended by the sacred writings, held in the highest estimation by Christianity, just as at a later time was contended in behalf of polygamy. The ideal of slavery was traced in the relations between a beneficent and just master and a faithful and loving slave, just as monarchy has been idealized in the charming picture of a just and generous king having no interest but the interests of his loving subjects, who thrive under his genial sway as plants in the sunlight.

Whether this line of speculation was intended as apologetic or to dominate the thought of the nineteenth century, it was insufficient to provide the security that slavery needed. The country was becoming populous and spreading over a vast area,

It was foreseen that popular support in favor of slavery could not be relied upon, unless the majority had a stake in its perpetuation, and this could only be secured by its territorial expansion.

In the meantime the sentiment hostile to the institution was passing toward definite crystallization. Respect for the Constitution and for the rights of the States under it retarded the action of causes that looked to the elimination of slavery. The scheme of colonizing the African in Africa, as means of preparing the way for more energetic measures, was conceived and put in course of execution, and the colony of Liberia established on the West African coast. The difficulties attending the emancipation of the slaves, from the fact that they could neither become assimilated with the populations of this country in their new condition, nor find a refuge suited to their condition elsewhere, was foreseen and attempted to be guarded against by this expedient. But the scheme of colonization failed to discover that the chief difficulty in the way of the emancipation of the slave did not lie in the question of his disposition after emancipation, but in the unwillingness of his master to part with him.

The ultimate disposal of the territory derived from the Louisiana Purchase caused great agitation as bearing upon the question of the extension of the area devoted to slavery. Louisiana and Arkansas were carved from this territory without precipitating any serious conflict, as the institution had already become firmly fixed upon them. The geographical position of this region was recognized as creating a political necessity that no interference should take place with the condition of labor then existing there.

Missouri was admitted as a State in 1820, after a conflict that tested the relative strength of the opposing factions. Missouri approached the southern border of the region that antagonized slavery, and brought the conflict to its doors. A long-continued struggle between the parties seeking the admission of Missouri as a slave State, and those who sought to exclude from her limits that institution, ended in the famous Missouri Compromise, by which slavery was forever inhibited north of the line of $36^{\circ} 30'$, except from the territory then constituted as the State of Missouri. The line of $36^{\circ} 30'$ corresponded very nearly with the southern line of Missouri, so that the allowance of slavery within that State was an infraction of the uniformity of the geographical partition between the free and the slave States. Thus Missouri became the northern boundary of that part of the Union devoted to slavery that lay west of the Mississippi. Part of this compromise was a provision for the return of fugitive slaves escaping into the free States, that was to be regarded as a pledge binding the policy of those opposing the institution. Indeed, the entire compromise was intended to place the dispositions accomplished by it upon the good faith of the respective parties that had taken part in its enactment, for no one entertained the idea that the constitutional powers of Congress were in any way limited by it.

The Missouri Compromise, sustained for thirty years through the genius and labors of Webster, Clay, and Calhoun, deferred the inevitable conflict between the slave-holding and free regions, which finally arose with the first serious infraction of its provisions, until the Northern States had outstripped the Southern States in population and wealth, and were able to maintain in arms the indissoluble nature of our Union.

This important step taken in 1820 appears to have been the turning point in the development of the opposition to the institution. The agitation in behalf of the emancipation of the slaves throughout the Union, and as a preliminary to that step the

emancipation of the slaves within the territory that constituted the seat of government, soon after the event just referred to took on an organized form. In 1823 the first abolition convention met in Philadelphia.

That which had existed as a humane sentiment largely diffused through the free States began to crystallize into a conviction and policy that foreshadowed an aggressive movement for the extirpation of the entire system of slavery. That which had been nursed by humane sentiments struck its roots deep into conceptions of the principles that should govern the relations of mankind in their associations, and gave rise to utterances the intensity of which expressed not only the depth of the convictions from which they arose, but the passionate reactions from the barriers whose strength resisted the progress of the movement. The Constitution of the United States placed the internal economy of the States beyond the control of Congress, and thus the institution as it existed within the States could not be reached by the national power, even if that power could be wielded in the interest of free labor. Within the District controlled by Congress this power existed, but was in the hands of the partisans of the slave system and their political friends of the North.

The policy of agitation was the only course open to the advocates of emancipation, and that policy was pursued with vigor and industry that was untiring. Speeches, pamphlets, appeals and petitions to Congress for emancipation disseminated the ardent thoughts and feelings of the advocates of freedom, intended to fire the hearts of the people to a new crusade. These utterances were not confined to the people of the free States, but were delivered in the very midst of slavery and communicated through the press. Advocates of freedom were found with convictions so strong that they did not shrink from the dangers that attended personal contact with the adherents of the slave system. Retaliatory violence intensified the situation, firing the zeal of those who acted from enthusiasm, and alarming the timid and cautious. In Congress debate became altercation, especially when petition after petition poured in upon that body for some relief looking to the emancipation of the slave. The right of petition to the representatives of the people, that was part of our inheritance from England, seemed for a time in jeopardy. The threat of disunion came from the slave-holding States in an undertone that produced its effect upon many of the people of the Northern States.

The necessary consequence of such energetic movements, in a form that many could not distinguish from incipient revolution, was to produce a conservative reaction at the North, and to divide the sentiment of that section, thus complicating the situation, and for a time retarding the progress of the general feeling in favor of freedom to the slave. Apprehension for the safety of the Union, respect for the Constitution and the compromise that had at least served the purpose of separating combatants who might otherwise have met in dangerous collision, were part of the causes of a reactive tendency at the North, while political considerations looking to the solidity of party action had a large part in the result.

In this instance, as often happens, the conservatism of the North prevented the final issue of the conflict from being the direct consequence of aggressions on the part of the advocates of freedom, and the disaster to the Union that might have followed an aggressive policy of public action on the part of the Northern States at that time.

In the midst and heat of the conflict a train of causes was laid that tended by inevitable steps to the

final contest that eliminated slavery from the institutions of this country. Texas, largely peopled from the Southern States, had asserted her independence of Mexico, and was regarded as an acquisition to the Union that would strengthen the political power of the slave States. Texas, although free from slavery under Mexican rule, soon became the recipient of a slave immigration that fastened the institution upon her. The admission of Texas as a State of the Union was the result of the policy of extending the area of slavery, and was accomplished in 1845 after a struggle that laid the foundation of a recast in political parties that was destined to divide the politics of the country upon lines of difference between the advocates and opponents of slavery.

The Mexican War, that was a not uninvited consequence of the annexation of Texas, terminated with the acquisition of a vast territory that carried the western boundary of the United States to the Pacific. A new field was opened for the contest in behalf of the extension of the area of slavery. This acquisition came to us as free territory, and an early effort was made to have it so declared in perpetuity by Congress, under the name of the Wilmot Proviso. This effort failed, and soon the question of the organization of this vast territory was pressed upon Congress.

In 1850 the compromise offered by Henry Clay was adopted, which ignored the question of a determination by Congress of the character, as it regarded slavery, of the States to be formed from the territory acquired from Mexico by the treaty that concluded the war with that country, such action being based upon the idea that as slavery did not exist in that territory any declaration upon that subject was unnecessary. The South disputed this assumption that slavery did not exist there, claiming that when the slave-holder from the States carried his slaves into that region the guarantees of the Constitution went with him, thus creating there the rights incident to the slave system. The compromise of 1850 did not bring these opposite contentions to a test, and can only be regarded as an armistice before the great conflict that was soon to arise. That contest assumed a definite form when Kansas and Nebraska were organized as territories of the Union.

The assumption by Congress, as a federal duty, of the capture and return of fugitive slaves escaping into free States, by an act for the rendition of such slaves, intensified the bitterness of the contest that was raging through the country, north and south. Upon the question of the right of Congress to exercise this prerogative the interests of the parties were reversed. The party of strict construction insisted that Congress should claim and exercise it as a constitutional power, although not in the class of enumerated powers, and incapable of being regarded as a necessary incident to such powers. The party of liberal construction opposed it, both parties acting from their respective views of its policy rather than their view of its constitutionality. The attempt to execute this law produced a profound impression upon the Northern mind by acquainting it with the repulsive features of the slave system.

The organization of Kansas and Nebraska as territories, in 1854, was the pivot on which the fate of slavery turned. The Missouri Compromise was disregarded and the subject of the establishing or excluding slavery was left to the decision of the people of these territories. To this proposition, made by Stephen A. Douglass, the expression "squatter sovereignty" was applied at the North as expressing the uncertain character of the population to whom this important question was submitted.

This disposition was a logical consequence of the compromise of 1850, which, by withholding action on the part of Congress, necessarily left the matter

to the local authorities that should be thereafter instituted over those territories.

The struggle to colonize Kansas in the interest of the respective sections of the country was maintained by both parties in a desperate conflict that assumed the character of partisan warfare rather than that of civil competition. In the end the party of freedom prevailed, and Kansas and Nebraska came into the Union as free States. Of this conflict history must say that the party of slavery was contending for economic advantages, while the party of free labor was striving to vindicate a principle that was believed to be fundamental to all free society among men. Such conflicts are apt to produce that type of heroism that combines audacity with the spirit of self-sacrifice, even in the absence of the ability to measure enterprises by the means possessed for their accomplishment. Such a hero was John Brown, the product of the bitter strife, the passion, and the aspiration that mingled in the Kansas conflict. The project of organizing a band of slaves near the border of the free States to make their way to Canada carried John Brown to Harper's Ferry, where he paid with his life the penalty of grave miscalculations as to the aptitude of the negro to execute dangerous exploits in the interest of freedom.

The election of Abraham Lincoln to the Presidency in 1860 was the culminating point of the controversy. This event was interpreted by the slave-holding States as a presage of a change in the balance of power that would secure to the free States a controlling influence in the public affairs of the nation. The political ascendancy possessed by the Southern States from the formation of the Government, and which had been perpetuated through their political affiliations at the North, was seriously threatened through dissensions arising among these political friends. The aggressive character of the Abolition movement, as demonstrated in Kansas and in the hardy enterprise of John Brown, alarmed the slave-holding interest. The resolution of the leaders of Southern opinion was soon taken, and a policy of disunion was formed, and steps taken to bring the people of the Southern States to its acceptance. Popular acquiescence in this plan was by no means to be anticipated without effort and adroit management, as the mass of the people had not the motives impelling in the direction of disunion that affected the great slave-holders. A disposition was general to avoid independent State action, and to fix the policy of the Southern States in consultation among those States. Those who at heart desired to adhere to the Union, and yet feared to fall under suspicion of disloyalty to Southern interests, took the moderate position that whatever action was taken should be with the co-operation of all the slave States, and therefore upon consultation with them. The leaders of the movement in South Carolina were not willing to trust the question to the hesitation and delay incident to such formal action, but desired to precipitate a condition of affairs that would make the strongest appeal to the friends of Southern interests. Accordingly South Carolina passed in convention an ordinance of secession from the Union, and proceeded to arrest the exercise of the public functions of the National Government within her territories, and to appropriate the public property of the United States. Ten States followed South Carolina, and united with her in the constitution of the government of the Confederate States of America.

The war that ensued tested the relative value of the economic systems of the two sections. At the South the producing class, consisting of the slaves, carried forward the industries of the country almost without interruption. Food-supplies were abundant at the points of production, but were not available

to the armies in the field for want of transportation and system. At the North, on the other hand, large drafts were made upon the producing classes to supply men for the armies, and yet the industry of that section was maintained and its resources made available for the support of the war.

The first direct and important effect of the war upon the institution of slavery was accomplished by the Emancipation Proclamation of President Lincoln, issued Jan. 1, 1863. This proclamation, the product of the disasters of the early stages of the war, assured the emancipation of all slaves that should be within territory acquired by the arms of the nation. The end came at last when the entire territory of the seceding States was brought under the military power of the United States. According to the laws of war it was for the captor to determine the effect of conquest upon the persons and property found within the conquered territory. The terms of the proclamation indicated the course of military action toward the slave, and in accordance with its provisions the right of the slaves to their liberty was recognized and secured by the military authority. This action, while sufficient to change the status of all slaves upon whom it took actual effect, could not, and did not, change the local laws of the places subjected to the military power so as to prevent the future acquisition of slaves, those laws, according to the principles of international law everywhere respected, remaining in force until repealed by competent authority, and a military command was not competent to change them, except for the time of actual military occupancy.

In those States that adhered to the Union and in which slavery existed, the proclamation of the President and action in accordance with it could not produce the effect of emancipation.

The final act that terminated the existence of slavery in the United States was the Thirteenth Amendment of the Constitution, adopted by two-thirds of the States, that declared that neither slavery nor involuntary servitude, except as a punishment for crime, whereof the party shall have been duly convicted, shall exist within the United States or any place subject to their jurisdiction.

The estimation in which the institution of slavery is entitled to be held, as a social factor, must depend upon the solution of the question whether it is capable of being brought into harmony with advanced social conditions. If thus capable, that fact must arise from the possibility of developing the slave relation into a condition in which it will harmonize with the principles upon which advanced conditions of social order depend. What is implied by development, as applied to that institution, cannot admit of doubt. If the slave, separated as to his condition by a wide interval from that of the society that surrounds him, is found advancing so as ultimately to cancel that interval, if his relations with others, especially his domestic relations, are advancing in stability, and if the service and discipline to which he is subjected are, by progressive steps, allowing to its subject more favorable conditions of development, then it may be affirmed that the relation is capable of development in the normal sense. But if, on the other hand, the slave appears to remain stationary or to retrograde, and no indication appears of increased stability and organization in his domestic and other relations, and if the regimen to which he is subjected grows more and more repressive, then it may be affirmed that the institution, if fairly represented in the instance supposed, is incapable of healthful development, and that its presence in an advanced community is an evil the magnitude of which is measured by the extent to which it prevails.

Examining the history of the institution as it existed in the United States in the light of these

principles, it is possible to place upon it its proper estimation. For the purposes of such an examination neither the instances that exhibit slavery in the most favorable light nor those that display its worst features must be taken in view, but attention should be given to the mass and the system as a whole.

In the early days of slavery in this country emancipation was quite common, but during the later years of slavery the instances of that kind were very rare, in part through repression by law and popular sentiment in the slave States, and in part through the increased value of slave property. Emancipation and even removal from the State for the purpose of emancipation were in some instances forbidden by law.

The inability of the slave to hold property underwent no relaxation, but on the contrary there were instances where masters were prevented by the operation of law from making provision for the support of slaves. When it is considered how large is the civilizing influence resulting from the responsibilities attendant upon the ownership of property, it will readily appear that if any amelioration of the system was to be anticipated it would be in the respect just named.

So far from there being any indication of any increased stability in the domestic relations among the slaves, the contrary appears. In the early days of slavery in this country it was possible that generation after generation of slaves born in a particular locality might spend their lives in that locality, and thus produce the semblance of domestic stability, but in later years this feature had to yield to commercial necessity, and the slave population was increasingly mobilized from year to year.

In early times it was no offence against law or public sentiment to instruct slaves, and especially to teach them to read and write, but in later years that practice was discontinued either as contrary to law or to public opinion.

Without going further, it is manifest that slavery in America, although having abundant time to manifest its tendencies, did not give indications of any possibility of reaching a condition in which it would be but a single step for the slave to pass into fair relation with the civilization that surrounded him. It is likely to be said that the responsibility for this condition of affairs is with those who, by agitating the question of emancipation, forced the slave-holder into a defensive attitude that entailed these disadvantages upon the slave; that it was simply a matter of self-protection to exclude the slave from contact with the feelings that prompted the aggressions upon the institution, and to accomplish this it was necessary that he should be kept incapable of reading.

But these disturbing conditions of environment were the necessary consequences of the existence of the slave institution in the midst of a community animated by the spirit of liberty and addicted to modern habits of thought. Call the aggressor by what name you will, Abolitionist, or what may better describe him, and after all he stands merely as the type of a tendency, inherent in every healthful organization, to eliminate such elements as are unsuited for assimilation, and impede its functional activities. The very question as it regards the social quality of slavery is whether it is of such a nature as to produce such conditions in advanced communities surrounding it. Organisms that have any vital power must act in that way. Physiological laws demonstrate the principle as its acts in communities. If a substance is intruded in the animal organism that cannot be assimilated and that interferes with the performance of function, violent and inflammatory methods of elimination are set up, proportionate in their energy to the vigor of the system. Communities of men act from the same tendencies, produ-

cing for the purpose instruments of elimination not always of an attractive character. The failure of slavery in America to assume forms consonant with the principles of our civilization must be attributed to its inherent character and not to the accidental means of its elimination.

The mere fact that a mass of human beings was to be held in a condition of servitude in a community permeated by the spirit of liberty rendered it necessary that the slave should be isolated from the sentiment of such community, and for that purpose that his mind should be kept closed against its literature and habits of thought and action, and also that freedom of intercourse between the two classes should be excluded. It was therefore a necessity of the institution that the conditions of development for the slave should be suppressed, if it was to be indefinitely perpetuated.

Concluding then, as we must, that the institution of slavery is irreconcilable with social conditions of an advanced type, the aggressions upon it are accounted for by its nature. The necessities of slavery entailed changes upon the political institutions of that section of the country, not only by weakening confidence in the principle of popular government, but by encouraging the use of irregular means of maintaining the domestic police, tending to undermine respect for regular government, and thus to open the door to unrestrained popular violence. It was impossible for the isolation of the slave to be accomplished to the extent necessary to maintain the institution by the regular means supplied by government. It was not practicable to embody in laws all the requirements of such isolation, and nothing less than a militia on constant duty, and irregular bands of citizens daily and nightly on watch and guard, with their humanity as the only measure of their authority, could secure the conditions under which the institution could be perpetuated.

The reasons that have been stated sufficiently account for the observed fact that the influence of slavery upon the political institutions of the country was greater and more effective than that of these institutions upon the conditions of slavery.

Slavery has entailed upon the United States a social problem of the greatest magnitude and difficulty. In all of the old slave States a very large portion of the population consists of the former slaves and their descendants, and in several of them that population exceeds the residue. For all purposes of estimating the nature of this social problem these populations must be regarded as composed of two distinct social masses, separated by their interests, by their habits of life, by the broadest race-differences, and by the fact that one exhibits civil organization of which the other is destitute. They live in common a language and necessary relations of industry. The utmost conceivable departure from homogeneity exists in the case. It is not possible that within the same State two systems of social organization can coexist; one must give way to the other, or they must blend to form something distinct from each. The last condition named evidently cannot take place, and the organized condition cannot give way to that which is without organization. If a community of interest could be brought about the other points of difference would cease to be of importance. To unite these interests it is necessary that the civil and political rights of the weaker party should be fully respected, and in that event, in certain States, the population consisting of the former slaves and their descendants would have the preponderating political influence. Until such unity of interest occurs they would naturally use their political power to advance their own separate interests. While discriminations are made against

their political rights, their interests will remain separate and distinct from those of the residue of the social body.

In all these States the political power is in the hands of one of these masses, even in States where they are in the minority. The white people have been trained by the institution of slavery to believe that the principles on which social liberty is based have no application to the negro. They have never grasped the truth, that is the highest commendation of popular government, that although the uneducated and undisciplined are the majority in such a community, such is the influence of developed mental power that it is able to cancel the advantage of superior numbers in an elective system, and to exercise the preponderating influence. To remove the causes that tend to separate the two great sections of the populations is the proper means of testing the sufficiency of the principle just stated to secure good government. Mutual fear is the cause of separation, and mutual confidence will be the means of inducing a higher social order. (A. J. W.)

SLIDELL, JOHN (1793-1871), politician, was born in New York in 1793. He removed to New Orleans and entered successfully into the practice of law, serving as District Attorney of the United States from 1829 to 1838. He was frequently elected to the State Legislature, in 1843 was elected to Congress, and in 1845 was appointed by President Polk Minister to Mexico. In 1853 he became a member of the United States Senate, to which he was re-elected in 1859. He spoke rarely in the Senate, but served on important committees and exerted great influence. In politics he was a strenuous supporter of the Southern State-rights party, and after the secession of Louisiana, in 1861, he withdrew from the Senate. In the autumn of this year he was sent, in conjunction with J. M. Mason, of Virginia, to France as a commissioner from the Confederate States. They embarked from Havana in the British mail steamer Trent, which vessel was stopped by the United States frigate San Jacinto, Captain Wilkes, on November 8th, the commissioners being taken off in defiance of the protest of the commander, and confined in Fort Warren, Boston Harbor. This indefensible action was enthusiastically received in the North, but Great Britain sternly demanded the immediate release of the prisoners, with threats of war in case of refusal. The feeling of the people was not shared by the President and Secretary of State, who recognized that the demand of England was a just one, and that the capture was in opposition to the rules of international law, as interpreted by the United States itself in the events that led to the War of 1812. The commissioners were accordingly set free, and sailed from Boston for England, January 1, 1862. Slidell did not return to America, but resided in London till his death, July 26, 1871.

SLOAT, JOHN DRAKE (1780-1867), naval officer, was born in New York City in 1780; entered the navy as a midshipman in 1800, and was honorably discharged, 1801. In 1812 he re-entered the service as a sailing-master, serving on the United States, in which ship he was engaged in the action with the British frigate Macedonian, Oct. 25, 1812, when the latter was captured. For this he received a vote of thanks and a silver medal, and was promoted lieutenant. In 1824-25 he served in the expedition against the West Indian pirates and participated in the capture of the pirate brig Palmyra. In 1824, as commander of the schooner Grampus, he took part in the destruction of the town of Foxhardo, Porto Rico, the pirates' headquarters, and afterward captured a brig on which was their chief, Colfreicias, who was afterward executed. For his services he was promoted in rapid succession master-commandant and captain, and had charge of the Norfolk navy-yard from 1840

to 1844. He next commanded the Pacific squadron, and on the outbreak of the Mexican war occupied Monterey, and secured San Francisco and other places on the Californian coast. In 1847 he returned to the Norfolk navy-yard, where he was in command till 1851, when he went to Hoboken to superintend the construction of the Stevens battery (see STEVENS, JOHN). On July 16, 1862, he was made commodore (retired list), and rear-admiral July 25, 1866. He died at New Brighton, Staten Island, Nov. 28, 1867.

SLOCUM, HENRY WARNER, general, was born in September, 1827, in Delphi, Onondaga Co., N. Y. On his graduation from West Point, in 1852, he was appointed 2d lieutenant in the 1st artillery, and promoted to 1st lieutenant in 1855. Next year he resigned his commission and engaged in the practice of law at Syracuse, and in 1860 was elected to the legislature. On the outbreak of the civil war he volunteered his services, and in May, 1861, received his commission as colonel of the 27th N. Y. volunteers, which regiment he commanded at Bull Run, where he received a severe wound. Commissioned in August, as brigadier-general of volunteers, he was assigned to the command of a brigade in Franklin's division of the Army of the Potomac, and took part in McClellan's Peninsular campaign of 1862. On Franklin's assignment to the 6th corps in May, Slocum succeeded to the command of his division, and, being sent to re-enforce Gen. Fitz-John Porter on the east of the Chickahominy, rendered signal service at the battle of Gaines' Mill, June 27, 1862, as also at Glendale and Malvern Hill, in both of which engagements his division occupied the right of the main line. Promoted, in July, to major-general of volunteers, he took part in the second Bull Run fight, as also in the battles of South Mountain and Antietam, in the Maryland campaign, and in October was appointed to the command of the 12th Army corps. In this position he fought bravely at Frederickburg, Chancellorsville, and Gettysburg, commanding, in the last of these battles, the right wing of the Union Army, and contributing in no small degree to the victory. His corps was thereafter transferred to the Army of the Cumberland, in which it served till April, 1864, when, on its being consolidated with the 11th, Gen. Slocum was assigned to a division and the command of the district of Vicksburg. Having, in August, succeeded to the command of the 20th corps, he was the first to occupy Atlanta, Ga., on Sept. 2d, in Sherman's march to the sea. In this grand progress, as well as in the march through the Carolinas, he commanded the left wing and took part in such actions as occurred up till Gen. Joseph E. Johnston's surrender at Durham Station.

In September, 1865, Gen. Slocum, for a second time, resigned from the army and again betook himself to the practice of law in Brooklyn, and was in the same year democratic candidate for the State of New York, but was defeated. In 1866 he was offered a commission as colonel in the regular army, but declined it. In 1868 he was presidential elector, and also in this year was sent to Congress, to which he was re-elected in 1870, and again in 1884. In Brooklyn he has held several prominent offices, having been president of the board of city works, and one of the commissioners of the Brooklyn bridge.

SMALL-POX (*Variola*): Cow-pox (*Vaccinia*).—Records of a disease identified as small-pox date before 1100 B. C. in China. Its progress westward was slow, for its first authentic appearance in Europe was in the sixth century A. D. It is known that the domestic animals, horned cattle, horses and sheep, are in some degree liable, each having a form of the disease varying from that of mankind and of every other. Monkeys are also somewhat susceptible. Small-pox is highly contagious through the

atmosphere and by inoculation, and transportable in fomites. The dark races of mankind are affected with greatest severity.

The period of incubation is about twelve days. Its access is rather abrupt, a brief rigor being followed by a high fever, severe pain in head, back, and extremities, vomiting and constipation—sometimes delirium and convulsions. On the third day a mottled-red eruption appears, more abundantly upon the face and hands than the covered parts of the body, and extending also to the mouth, pharynx and larynx. The eruption is at first papular, feeling like small shot embedded in the skin, gradually becomes vesicular with a central depression, which about the eighth day fills up, and the pock matures as a pustule. The fever declines on appearance of the rash, but reappears in the pustular stage, always in proportion to the irritation produced by the maturing pustules. The eruption is known as *discrete* when the pustules are distinct from each other, and *confluent* when they coalesce, and is often confluent on the face and hands and discrete on the body. The gravity of the case is according to the extent of the eruption. Scabs form on the discharged pustules, which leave, on falling, permanent depressions in the true skin. The duration of a natural case of discrete small-pox, from the initial rigor to the end of desquamation, is about four weeks; but the confluent form, in case of recovery, lasts longer and convalescence is tedious. The hemorrhagic form of small-pox is characterized by an eruption resembling at first that of measles or scarlatina, soon developing into small blisters filled with blood. Hemorrhages take place from various mucous surfaces. The temperature is lower than in other forms. The end is always fatal, and is reached from the fourth to the sixth day.

The most remarkable feature of small-pox is control over its severity by artificial production of a mitigated form. This was practised in Eastern countries from an unknown period, by inoculating the virus of human variola. On the second day a pimple appears which becomes vesicular on the fourth and pustular in three or four more. On the eleventh day a general eruption appears, but this is discrete, and recovery is almost uniform. Such a case is just as liable, however, to become a focus of infection as one of natural small-pox. Inoculation was introduced into England early in the 18th century, and was extensively practised in Europe and America until it was superseded by vaccination about the beginning of the present century.

A variolous disease prevailed extensively among horned cattle in Europe before the middle of last century, and it was known among farmers that milkers of variolous cows sometimes had pustules on the hands and were thenceforward insusceptible to small-pox. Artificial production of vaccine variola was proposed as a prophylactic against natural small-pox by Dr. Edward Jenner in 1798, who lived to witness its triumph over neglect, ridicule, and powerful opposition. The advantages over small-pox inoculation are its greater mildness and the avoidance of atmospheric infection. The vaccinated spot passes through the usual stages of the variolous eruption, and the scab falls from the fifteenth to the twenty-first day, leaving a peculiarly dotted scar. During the pustular stage there is a moderate fever, and the axillary glands are sometimes enlarged. As secondary attacks of small-pox occasionally take place, so many persons are susceptible to repeated vaccination after the lapse of years; and so, likewise, the protection against small-pox is often lost by neglect of vaccination. (See VACCINATION.)

The control of small-pox by vaccination is shown by the fact that this disease caused 96 deaths in 1000 in England from 1750 to 1800; from 1800 to 1850

the ratio was 35 in 1000, and has been much further reduced since vaccination became compulsory. In Germany, before vaccination was practised, the deaths from small-pox were 66.5 in 1000 from all causes, and after vaccination came in use, only 7.26. Among those partially protected by vaccination, and who still contract the disease, its severity is so mitigated that the average mortality is 5.24 per cent., while in the unvaccinated it is nearly 50 per cent.

CHICKEN-POX (*Varicella*).—This is a trivial contagious affection, from which children rarely escape in cities and towns, but to which adults are equally liable. An access of moderate fever is followed in a few hours by a vesicular eruption, which matures in 4 or 5 days and dries up with the formation of small scabs. Two or three crops of these vesicles may occur without an interval. The vesicles are easily broken, and often leave small depressions permanently in the skin.

The chief importance of this affection arises from the liability of confounding it with varioloid, or small-pox modified by previous vaccination. The points of distinction are as follows:

Varioloid.—Eruption appears on 3d day, and fever declines.

Eruption first papular, then vesicular, finally pustular.

Eruption most abundant on face and hands.

Fever violent.

Chicken pox.—Eruption and fever occur together.

Eruption vesicular throughout.

Eruption most abundant on trunk of body.

Fever moderate.

(S. S. H.)

SMET, PETER JOHN DE (1801-1873), Jesuit missionary to the Indians, was born at Dendermonde, Belgium, Dec. 31, 1801. He was educated at Mechlin, and in 1822 was sent to Maryland. In 1824 he was appointed a teacher in the University of St. Louis, and labored there until 1839. An embassy sent from the Flathead Indians about 1834 to ask for religious instruction had created a profound sensation. Father De Smet was then sent out and established missions both among the Flatheads in Oregon and among the Blackfeet on the Upper Missouri. To obtain assistance in the work and support he visited France and Belgium three or four times, and gave accounts of his work in English, French, and German. He was said to have more influence with the Indians of the Northwest than any other person. He died at St. Louis, May 23, 1873. His chief publications were *Letters and Sketches of a Residence in the Rocky Mountains* (1843); *Oregon Missions* (1847); *Western Missions* (1863); *New Indian Sketches* (1868).

SMELTING. See IRON.

SMILLIE, JAMES (1807-1885), engraver, was born in Edinburgh, Scotland, Nov. 23, 1807. He was apprenticed in 1819 to a silver engraver, and later worked with an engraver of pictures. His family came to Canada in 1821, and young Smillie worked there for some years. In 1827 he went to London, and after studying for five months under one Andrew Wilson in Edinburgh he returned to Quebec. He made his permanent residence in New York in 1830, and was there elected a National Academician in 1851. In 1874 he retired to Poughkeepsie, where he died, Dec. 4, 1885. The engraving after R. W. Weir's Convent Gate first drew attention to the young engraver, and it was followed by a series of plates, many after Weir's paintings, executed for the New York *Mirror* during 1832-36. Other important plates from his hand, all executed in the line manner, are *Dream of Arcadia* (1850) and the *Voyage of Life* (1853-54), after Cole; *Dover Plains* (1850), after A. B. Durand; *Mount Washington* (1851), after Kensett; *American Harvesting* (1851), after Cropsey; and *Bierstadt's Rocky Mountains* (1865-66). After

1861 his time was devoted mainly to bank-note engraving, and he is regarded as the pioneer in that line. His artistic reputation, however, rests on his landscape work, and he probably had no equal here in that branch of engraving.

His son, **JAMES DAVID SMILLIE**, born in New York, Jan. 16, 1833, is well known both as engraver and painter. The best productions of his burin are perhaps the illustrations for Cooper's novels, after Darley's designs, although much of his work was on bank-note vignettes. In 1864 he turned his attention to painting, and has since then produced *The Lifting of the Clouds*; *Dark against Day's Golden Death*; *Evening Among the Sierras*; *The Adirondacks*, *The Cliffs of Normandy*, and other important works. He became a member of the National Academy in 1876, was one of the original members of the Water Color Society, and one of the founders of the New York Etching Club. His brother, **GEORGE HENRY**, born in New York, Dec. 29, 1840, studied under his father and James M. Hart, and is well known as a painter. Among his works are *A Lake in the Woods*, *A Florida Lagoon*, *A Goat Pasture*, *Merrimack River*, and *Light and Shadow along Shore*, in oil, and *Under the Pines of the Yosemite*, *Near Portland, Maine*, and *September on the New England Coast*. He became a National Academician in 1882. (F. L. W.)

SMITH, CHARLES FERGUSON, a distinguished soldier of the civil war, was born April 24, 1807, in Philadelphia, son of Dr. Samuel Blair Smith, assistant-surgeon in the U. S. army, his maternal grandfather (from whom he had his middle name) having been Ebenezer Ferguson, a colonel in the Revolutionary war. In 1825 he was graduated at the U. S. military academy and entered the service as 2d lieutenant in the 2d artillery, being promoted to 1st lieutenant, May, 1832, and captain in July, 1838. From 1829 to 1842 he filled several posts in the military academy—instructor of infantry tactics, adjutant, and commandant of the corps of cadets. In the Mexican war he served under Gen. Zachary Taylor with such distinction that the four companies of artillery he commanded became famous as "Smith's light battery," while he himself received, in rapid succession, the brevets of major, lieutenant-colonel, and colonel for "gallant and meritorious conduct" at Palo Alto, Resaca de la Palma, Monterey, Contreras, and Churubusco. He took part in the storming of Chapultepec and in the capture of the City of Mexico, and was again honorably mentioned. From 1849 to 1851 he was member of a board to devise a course of instruction for siege, garrison, sea-coast, and mountain artillery which was adopted, May, 1851. In 1854 he was promoted major of the 1st artillery, and in 1855 was appointed lieutenant-colonel of the 10th infantry. He commanded the Red River expedition in 1856, the Utah expedition in 1857-61, and was, for a time, in command of the Department of Utah. On the outbreak of disturbances preceding the civil war, he was appointed to the charge of the city and department of Washington. In August, 1861, he was promoted brigadier-general of volunteers and sent to Kentucky, where, next month, he became colonel of the 3d infantry, and took command of the forces at Paducah. His conduct at the capture of Forts Henry and Donelson acquired him the reputation of a skilful tactician as well as of a gallant soldier. In the fight for possession of Donelson he commanded the division holding the left of the investing lines, and led in person the assault that stormed the high ground commanding the fort. Of his exploit here Gen. W. T. Sherman says in his *Memoirs*: "Gen. C. F. Smith was a very handsome and soldierly man of great experience, and at the battle of Donelson had acted with so much personal bravery that to him many attributed the success of the assault." He

next conducted the new movement up the Tennessee River, and, arriving at Savannah with a considerable fleet in March, 1862, took command of the city and made ready the advance on Shiloh. On March 21 he was promoted major-general of volunteers, but chronic disease, contracted in Mexico, was so aggravated by the exposure to which he had been subjected that he died on April 25, 1862, at Savannah.

SMITH, EDMUND KIRBY, Confederate general, was born, May, 1824, in St. Augustine, Florida. On his graduation from West Point, in 1845, he was appointed 2d lieutenant of infantry, and in the Mexican war for gallantry at Cerro Gordo and Contreras was twice brevetted. From 1849 to 1852 he acted as assistant professor of mathematics at West Point. In 1855 he was appointed captain in the 2d cavalry, and served with distinction on the frontier, being wounded in May, 1859, in an engagement with the Comanche Indians, for his services against whom he received the thanks of the legislature of Texas in 1861. In January, 1861, he was promoted major, but on the secession of his native State in May of this year, he resigned his commission, and was appointed lieutenant-colonel in the cavalry corps of the Confederate army. His subsequent promotion was rapid. On June 17 he was made brigadier-general; on Oct. 11, major-general; on Oct. 9, 1863, lieutenant-general; and on Feb. 19, 1864, full general. He was present at the first battle of Bull Run, and was severely wounded early in the engagement. In 1862 he was assigned to the command of the Department of East Tennessee, Kentucky, North Georgia, and Western North Carolina. In the Kentucky campaign he led the advance of General Bragg's army, and, Aug. 30, 1862, defeated the Union forces under Gen. W. Nelson, at Richmond, Ky. Having been assigned in February, 1863, to the Trans-Mississippi Department (comprising Texas, Louisiana, Arkansas, and Indian Territory) he, in accordance with his instructions, organized a government there, making his communications with Richmond by running the blockade at Galveston and Wilmington, N. C. By a similar process of blockade-running he shipped large quantities of cotton to Europe, receiving back machinery, by the aid of which he was successful in establishing factories and furnaces, in opening mines, and in manufacturing powder and castings, so that by the time the war closed he had made his department self-supporting, his forces being the last to surrender. In 1864 he was largely instrumental in baffling Gen. Nathaniel P. Banks in his Red River campaign. Since the war Gen. Smith has been president of the Atlantic and Pacific Telegraph Company, chancellor of the University of Nashville, and, since 1875, professor of mathematics in the University of the South, Sewanee, Tenn., which last position he continues to hold.

SMITH, ELI (1801-1857), missionary, was born at Northfield, Conn., Sept. 15, 1801. He graduated at Yale College in 1821 and at Andover Seminary in 1826. He was immediately sent by the American Board as a missionary to Malta, but soon removed to Beyrout, Syria, which was the chief scene of his labors. His visit to the Nestorians of Persia in 1830 is related in his *Missionary Researches in Armenia* (1833). In 1838 and again in 1852 he was the companion of Rev. Edward Robinson (for whom, see *ENCYCLOPEDIA BRITANNICA*) in his journeys in Bible lands. The *Biblical Researches* which have established the fame of Robinson owe much of their accuracy to Dr. Smith's help. As a proper foundation for missionary work Dr. Smith exerted himself to establish at Beyrout an Arabic press, and for it he had cast at Leipzig, under his own supervision, an improved font of Arabic type. His great work of translating the Bible into modern Arabic was commenced in 1847, and within the remaining ten years

of his life he had completed the New Testament and the greater part of the Old. He died at Beyrout, Jan. 11, 1857. The Arabic translation of the Bible was finished by Rev. Dr. C. C. Van Dyke.

SMITH, ERASMUS PESHINE (1814-1882), jurist, was born in New York City, March 2, 1814, but at an early age was taken to Rochester. He graduated at Columbia College in 1832, and at the Harvard Law School a year later. He entered on practice at Rochester, but was also engaged in journalism until 1850, when he was appointed professor of mathematics in the University of Rochester. In 1852 he was made State superintendent of public instruction, and in 1857 reporter of the State court of appeals. In 1864 he was called to Washington to be U. S. commissioner of immigration, but soon was appointed examiner of claims in the Department of State. In 1871 Secretary Hamilton Fish, having been asked by the Mikado of Japan for an adviser in international law, selected Prof. Smith. The latter spent five years in Japan in preparing treaties and directing the foreign relations of that empire. During this time a Peruvian ship with a cargo of 230 Chinese coolies was wrecked on the coast of Japan, and that government, by the advice of Prof. Smith, detained them until the question of their destination was settled by the arbitration of the Russian government. The coolies by its decision were sent back to China, and this affair broke up the coolie trade. Prof. Smith returned to Rochester in 1876 and died there, Oct. 21, 1882. His chief publication was a *Manual of Political Economy* (1853), in which he advocates protection.

SMITH, GERRIT (1797-1874), philanthropist, was born at Utica, N. Y., March 6, 1797. His father, Peter Smith, had been associated with John Jacob Astor in the fur trade, and had purchased vast tracts of land in northern New York. Gerrit, after graduating at Madison College in 1818, settled at Peterboro, and devoted himself to the management of his estate. In 1825 he joined the American Colonization Society and contributed liberally to its funds until he became convinced of its inefficiency as an aid to the colored people. In 1835 he turned to the Anti-Slavery Society and became prominent in its work. He gave away to actual settlers, whether white or black, small farms from his estate, and thus gathered around him a thrifless lot. In 1852 he was elected to Congress, but served only one session. To every assault on the slavery system he was a willing contributor, and hence gave aid to the Free Soil settlers in Kansas and to John Brown's project in Virginia in 1859. The war for the Union enlisted his sympathies and active support, but at its close he was in favor of universal amnesty. Originally trained in orthodox belief, he became a Universalist and extreme rationalist. He wrote and spoke against revealed religion, yet in the church he had built at Peterboro he frequently preached. He died at New York City, Dec. 28, 1874.

SMITH, GOLDWIN, an English historical and political writer, was born at Reading, Berkshire, Aug. 13, 1823. He was educated at Eton and Magdalen College, Oxford, graduating with high honor in 1845. He was chosen fellow and tutor of University College, and in 1847 was called to the bar at Lincoln's Inn. In 1850, and again in 1854, he was secretary of a Royal commission of University reform, and from 1858 to 1866 he was a member of the Education commission, whose labors resulted in the Education bill of 1870. He was also appointed regius professor of modern history at Oxford in 1859, and held this position till 1866. He had always been an advanced Liberal in politics, and during the American civil war was conspicuous for his defence of the Union. Among his publications of this time are *The Foundation of the American Colonies* (1861); *The Morality of the Emancipation Proclamation* (1863). In 1864 he

visited the Northern States on a lecturing tour, and on his return published *England and America* (1865) and *Civil War in America* (1866). He was called in 1868 to Cornell University to be professor of English history, but in 1871 he settled at Toronto, Canada, where he became a member of the senate of the university. He edited the *Canadian Monthly* until 1874, and then became editor of the *Bystander*, a political weekly. After this was discontinued he was editor of *The Week*, but in 1887 he finally separated from it. In that year he returned to England, where he has continued his literary activity, discussing public questions affecting England, Ireland, Canada, and the United States. Besides his works already mentioned he has published *Irish History and Irish Character* (1861); *Three English Statesmen*, sketches of Pym, Cromwell, and Pitt (1867), *Short History of England* (1869); *William Copeper in the English Men of Letters* (1880); *Conduct of England to Ireland* (1882).

SMITH, HENRY BOYNTON (1815-1877), Presbyterian theologian, was born at Portland, Maine, Nov. 21, 1815. He graduated at Bowdoin College in 1834, and studied theology at Andover and Bangor. After some time spent in study at the Universities of Halle and Berlin, he was in 1841 acting president of Bowdoin. In 1842 he became pastor of the Congregational Church at West Amesbury, Mass., and in 1847 he was made professor of moral and mental philosophy in Amherst College. In 1850 he was called to the professorship of church history in Union Theological Seminary, New York, and in 1854 he became professor of systematic theology. After holding this position twenty years he resigned on account of ill-health, and died, Feb. 7, 1877. He was a promoter of the Evangelical Alliance and of the reunion of the Presbyterian Churches. He had belonged to the New School branch, and as moderator of its General Assembly in 1863 he welcomed the first delegation from the Old School body. He was one of the editors of the *New York Evangelist* and of the *American Theological Review*, which afterward became the *Presbyterian Review*. He translated and edited Gieseler's *Church History* and Hagenbach's *History of Doctrines*. From his writings have been collected volumes, published posthumously, on *Faith and Philosophy*, *Apologetics*, and *Introduction to Theology*.

SMITH, JOHN LAWRENCE (1818-1883), chemist, was born near Charleston, S. C., Dec. 17, 1818. He was educated at Charleston College and the University of Virginia, and became a civil engineer. After some service on the Charleston and Cincinnati Railroad, he studied medicine and graduated at the Medical School of the University of South Carolina. After three years' further study in France and Germany, he began practice at Charleston in 1844. Two years later James Buchanan, then U. S. Secretary of State, was requested by the Sultan of Turkey to recommend some person for the purpose of instructing the people of that empire in the cultivation of cotton. Dr. Smith was selected and went to Turkey, but the original purpose of his mission was not carried out. He was made mining engineer to the Turkish government, and spent four years in examining the mineral resources of the empire. One result was his publication on the *Thermal Waters of Asia Minor* (1849). Returning to the United States, Dr. Smith discovered emery and corundum in North Carolina. He completed his invention of the inverted microscope, which he had commenced in Paris in 1850. He was appointed professor of chemistry in the University of Virginia, but, having married the daughter of James Guthrie, U. S. Secretary of the Treasury, removed to Louisville, Ky., where he became professor of chemistry in the Medical School. He was afterward superintendent of the

Louisville gas-works. In 1867 he was U. S. Commissioner to the Paris Exposition, and in 1873 to that of Vienna, and in connection with these prepared valuable reports on industrial chemistry. In 1876 he was one of the judges at the Centennial Exhibition at Philadelphia, and wrote the report on *Petroleum*. In 1874 he had been chosen president of the American Association for the Advancement of Science. He had the best collection of meteorites in the United States, having purchased that of Dr. Gerard Troost (*q. v.*), and greatly enlarged it. This collection is now in possession of Harvard University. Dr. Smith was active in religious and philanthropic movements. He endowed the Baptist Home at Louisville. He died, Oct. 12, 1883. He had published more than 70 scientific papers, and many of these were gathered in his *Mineralogy and Chemistry, Original Researches* (1873), of which an enlarged edition, with biographic sketch, was issued after his death.

SMITH, PERSIFOR FRASER (1798-1858), general, was born in Philadelphia in November, 1798, both his grandfathers having served with honor in the war of the Revolution. After graduating at Princeton in 1815, he studied law in Philadelphia and, on his admission to the bar, removed to New Orleans. His passion was, however, for arms, and at the outbreak of the Seminole war, being adjutant-general of Louisiana, he raised some regiments of volunteers, marched to the scene, and there conducted himself so as to attract the special attention of Generals Gaines, Scott, and Taylor, and insure their lasting confidence. On the conclusion of this war he returned to his judicial functions in New Orleans, but in the spring of 1846, hearing of Gen. Taylor's straits on the Rio Grande, he again raised a body of volunteers and hastened to his assistance, remaining in command of a brigade till the close of the war with Mexico. He distinguished himself especially in the fierce battle of Monterey, for which he was brevetted brigadier-general in the U. S. Army. Gen. Smith then joined the army under Gen. Winfield Scott, and his conduct at the battle of Contreras elicited the warmest praise of that commander. For his services here, and at the immediately subsequent battle of Churubusco, he was brevetted major general, Aug. 20, 1847. On the resumption of hostilities, after an intervening armistice (for which he was a commissioner), he participated in the affair of Chapultepec and was in active service at the capture of the city of Mexico. At the conclusion of the war he was ordered to California, where he held command of the Military Department, and afterward held a similar command in Texas. In December, 1856, he was appointed to the full rank of brigadier-general and ordered to Kansas. In April, 1858, he was assigned to the command of the Department of Utah. This he held only for a month, dying at Fort Leavenworth, Kansas, whither he had gone for his health, May 17, 1858.

SMITH, SAMUEL (1752-1839), general and statesman, was born at Lancaster, Pa., July 27, 1752. His father, born in Ulster, became a successful merchant in Baltimore, took part in the patriotic movements at the outbreak of the Revolution, was a delegate to the Maryland constitutional convention in 1776, and afterward State senator. Samuel, after a business-training in his father's counting-room, went to Europe in 1772, and travelled extensively. Returning in 1775, he became a captain in a regiment of the Maryland line, fought in Long Island, and at White Plains, where he was wounded. In 1777 he was promoted to be major, and fought at Brandywine. Ordered by Washington to Fort Mifflin, near Philadelphia, he sustained a siege by the British from Sept. 26 to Nov. 11, and then, being wounded, retired to New Jersey. For his defence Congress

gave him a vote of thanks and a sword. He was afterward at Valley Forge and Monmouth, then resigned his commission, though acting as colonel of militia at Baltimore. In 1783 he was made a port warden there and in 1790 was elected to the legislature. He commanded the quota of Maryland troops called out to suppress the Whiskey insurrection in Pennsylvania. For ten years from 1793 he was a representative in Congress, serving also for a short time in 1801 as secretary of the navy. In 1803 he was elected to the U. S. senate, and was one of the prominent supporters of Jefferson's policy. He was major-general of the Maryland troops in defence of Baltimore in 1814. He was active in promoting the interests of Baltimore, helping to found the Bank of Maryland in 1790, to establish a library, and to adorn the city with the monuments which long gave it the name "Monumental City." At the age of 83, long after he had retired from public work, he was called to suppress a mob, and did the work so effectively that he was elected mayor and served for three years. He died at Baltimore, April 22, 1839.

His brother, ROBERT SMITH (1757-1842), also born at Lancaster, graduated at Princeton College in 1781, studied law, and practised at Baltimore. He served in many public capacities, was a presidential elector in 1789, state senator in 1793, delegate, 1796-1800, and member of the city council, 1798-1801. Pres. Jefferson made him secretary of the navy from January, 1802, till 1805, and U. S. attorney-general from March till December, 1805. He was appointed chancellor of Maryland soon afterward, and Pres. Madison called him into his cabinet as secretary of state in March, 1803, but in November, 1811, when the faction clamorous for war with Great Britain gained the upper hand, Smith retired, though Madison offered him the embassy to Russia. In 1813 he was made provost of the University of Maryland, and he held other posts of honor. He died at Baltimore, Nov. 26, 1842.

SMITH, SAMUEL FRANCIS, minister and hymn-writer, was born at Boston, Oct. 21, 1803. Graduating at Harvard in the famous class of 1829 with Dr. O. W. Holmes, Rev. James Freeman Clarke, and others of note, he studied theology at Andover, and in 1831 became pastor of a Baptist church at Waterville, Maine. Before this he had written for the press, had translated for Dr. Lieber's *Encyclopaedia Americana*, and had edited the *Baptist Missionary Magazine*. In 1843 he removed to Newton, Mass., where besides pastoral work he conducted the *Christian Review* for seven years. Religious and secular journals and magazines welcomed his contributions. His national hymn "America," "My country, 'tis of thee," was written at Andover in 1832 and first sung publicly in Park Street Church, Boston, July 4, 1833. Another of his hymns is "The morning light is breaking." In 1855 he became editor of the periodicals of the Baptist Missionary Union. He contributed to Sprague's *Annals of the American Pulpit*, and to the *Baptist Jubilee*. The *Psalmist*, a standard Baptist hymn-book, contains 27 of his hymns. Among his later publications are *Missionary Sketches* (1879); *a History of Newton, Mass.* (1880); and *Rambles in Mission Fields* (1884).

SMITH, SAMUEL STANHOPE (1750-1819), educator, was born at Pequea, Pa., March 16, 1750. His father, Dr. Robert Smith, had emigrated from Ulster, and settled in Pennsylvania as pastor of a Presbyterian church, conducting also a classical academy, which became famous. The son studied in it, and, after graduating at Princeton College in 1769, returned to teach. But he was soon called to be a tutor at Princeton, and was ordained to the Presbyterian ministry in 1774. He went to Virginia, and in 1775 became the first president of Hampden-Sidney College. In 1779 Samuel was called to be

professor of moral philosophy at Princeton, and in 1783 he was made professor of theology. In 1786 he became vice-president, and finally, in 1795, president, of the college, retaining this position till 1812. (See NEW JERSEY, COLLEGE OF.) In the Presbyterian Church he was almost equally influential with his predecessor, Rev. Dr. John Witherspoon (*q. v.*) whose daughter he had married. In the organization of that church, in 1786, he took part in drafting its form of government. Dr. Smith was noted for his dignity, courtly manners, and eloquence—trained on the French models. He died at Princeton, Aug. 21, 1812. Besides separate sermons, he had published a volume in 1798, and after his death two more volumes appeared with a memoir. He had also published *Lectures on the Evidences of the Christian Religion and on Moral Philosophy* (1809), a *System of Natural and Revealed Religion* (1816), and had brought down to a later date the *History of the United States* by his brother-in-law, Dr. David Ramsay.

His brother, JOHN BLAIR SMITH (1756-1799), also a Presbyterian minister and educator, was born at Pequea, Pa., June 12, 1756. He graduated at Princeton College in 1773, and studied theology with his brother, then president of Hampden-Sidney College, and succeeded him in this position in 1779. Also gifted with eloquence, he became a noted revival preacher in the Valley of Virginia. In 1791 he was called to the Third Presbyterian Church, Philadelphia, and after four years' service was made president of Union College, Schenectady, N. Y.; but in May, 1799, he was induced to return to his former charge in Philadelphia. This later service was cut short by his death on Aug. 22, 1799.

SMITH, SEBA (1792-1868), best known under the name "Major Jack Downing," was born at Buckfield, Maine, Sept. 14, 1792. He graduated at Bowdoin College in 1818, and became a journalist at Portland. His humorous political letters, satirizing President Jackson, were in 1833 collected in a volume which passed through many editions. A later work of a similar character was his *Thirty Years out of the Senate* (1859). Smith also published several poems, the longest of which was *Powhatan* (1841), and a volume of sketches called *Down East* (1855). He died at Patchogue, L. I., July 29, 1868. He had married Elizabeth Oakes Prince, who contributed many poems to periodicals, at first anonymously, but openly after her husband had become embarrassed in business. Her first collection was called *The Sinless Child and other Poems* (1843). Then came tragedies, *The Roman Tribute* and *Jacob Leisler, or Old New York*, and, after a long interval, *Destiny*. Meantime she had published several novels and tales and some works on woman's rights. After her husband's death she resided for many years in New York City, but afterward in North Carolina.

SMITH, WILLIAM (1726-1803), the first provost of the University of Pennsylvania, was born in Aberdeen, Scotland, in 1726. After graduating at the university of that city, in 1747 he emigrated to America and became tutor in the family of Col. Martin, on Long Island. He was called by Franklin and others to Philadelphia to take charge of the projected college. His *General Idea of the College of Mirania* gave his view of what was to be aimed at in the new institution. To obtain help for it and to receive episcopal orders he visited England in 1753. The academy which was opened in that year became in 1754 the College of Philadelphia. His loyal adherence to the Penn family provoked political controversies, and at one time he was thrown into prison, where his classes came for instruction. On his second visit to England, in 1759, the University of Oxford conferred on him the degree of D. D., and on a third, in 1762, he collected for his college £6,000. He took the patriotic side in the crisis of the revolu-

tion, and his oratorical powers were enlisted in favor of Congress. Yet at the close of the war a factious opposition was made against him, and the legislature chartered the University of Pennsylvania to supersede the college. Smith resisted, and in 1789 was again recognized as provost of the college. In 1791 a compromise was effected, the college was merged in the university, but Dr. Smith retired from office. He died at Philadelphia, May 14, 1803. His publications comprise various sermons and orations, some political tracts, and a history of *Bouquet's Expedition against the Western Indians*. A selection of these was published in 1803.

His grandson, RICHARD PENN SMITH (1799-1854), obtained some note as a dramatist. He was born in March, 1799, and admitted to the Philadelphia bar in 1821. He edited the *Aurora* for the next six years and then wrote for Edwin Forrest two tragedies, *Caius Marius* and *The Venetian*. Besides other successful plays, he wrote some novels and a *Life of David Crockett* (1836). He died, Aug. 12, 1854. His son, Horace Wemyss Smith, born in 1825, has edited his *Works*, written a *Life of William Smith* (4 vols.), and compiled *Patriotic Songs of America*.

Another grandson, William Rudolph Smith (1787-1868), went to Wisconsin in 1837, and became attorney-general of that State in 1853. He was also president of its Historical Society and published *History of Wisconsin* (4 vols., 1854).

SMITH, WILLIAM, has been highly successful in uniting the labors of scholars in his dictionaries of biblical, classical, and early Christian literature. He was born in London in 1813, and graduated at its university, being a layman and originally a Dissenter, though he afterward entered the Church of England. From 1853 to 1869 he was classical examiner for London University, and afterward a member of its senate. Since 1867 he has been editor of the *Quarterly Review*. His chief Dictionaries are those of *Greek and Roman Antiquities* (1840-42); *Greek and Roman Biography* (1843-49); *Dictionary of the Bible* (3 vols., 1860-63), the American edition being enlarged and improved by Profs. H. B. Hackett and E. Abbot (4 vols., 1869-70); *Christian Antiquities* (2 vols., 1875-80), in which Prof. Cheetham assisted; and *Christian Biography* (4 vols., 1877-86), in which Dr. Henry Wace assisted. The last two works come down only to the age of Charlemagne. Dr. Smith's son Philip has been associated with him in the preparation of the numerous works of reference above mentioned, and has published a *History of the World*.

SMITH, WILLIAM FARRAR, a general of the civil war, and known in the army as "Baldy" Smith, was born in St. Albans, Vt., Feb. 17, 1824. He graduated at West Point in 1845, was made brevet 2d lieutenant of topographical engineers, and, after a year's service in this department, became assistant-professor of mathematics at West Point, which post he filled for two years. His next service was in Texas for the Mexican boundary commission and in Florida till, in 1855, he was reinstated in his former office at West Point, being then 1st lieutenant. In 1856 he was assigned to light-house construction service, and in 1859 was made engineer-secretary of the Light-house board. In June and July, 1861, he served on the staff of Gen. B. F. Butler at Fortress Monroe, and then became colonel of the 3d Vermont Volunteers. He was engaged in the first battle of Bull Run on the staff of Gen. McDowell. Commissioned, Aug. 13, brigadier-general of volunteers, he continued to serve on the defences of Washington till March, 1862. In McClellan's Peninsular campaign he was brevetted lieutenant-colonel in the regular army for gallant and meritorious service at the battle of White Oak Swamp, and

had taken part also in the siege of Yorktown, and the battles of Williamsburg, Fair Oaks, Savage Station, Glendale, and Malvern Hill. In July, 1862, he was advanced to major-general of volunteers, but this promotion was not confirmed by the Senate. In the Maryland campaign he led his division in the battles of South Mountain and Antietam, receiving the brevet of colonel in the regular army for the latter engagement. In November, 1862, he was assigned to the command of the Sixth Corps and took part in the battle of Fredericksburg. In February, 1863, he was transferred to the Ninth Corps and, on March 3, became major in the Corps of Engineers. In June and July, 1863, he commanded a division of the Department of the Susquehanna; in October, became chief engineer of the Department of the Cumberland, and, in November, of the military division of the Mississippi. In October he directed the throwing of a pontoon-bridge over the Tennessee at Brown's Ferry, below Chattanooga, and the capture of the heights above it, and participated in the battle of Missionary Ridge. Of his services here Gen. George H. Thomas, in his report, says: "To Brig.-Gen. W. F. Smith should be accorded great praise for the ingenuity which conceived and the ability which executed the movement at Brown's Ferry. When the bridge was thrown at Brown's Ferry, on the morning of the 27th Oct., 1863, the surprise was as great to the army within Chattanooga as it was to the army besieging it from without." In April, 1865, the House committee on military affairs unanimously agreed to a report that, "as a subordinate, Gen. William F. Smith had saved the army of the Cumberland from capture, and afterward directed it to victory." In March, 1864, his rank as major-general of volunteers was confirmed, and in May he was placed in command of the Eighteenth Corps, which he led at Cold Harbor and at Petersburg till July, when he was assigned to special duty. On March 13, 1865, he was brevetted brigadier-general of the U. S. army for his services at the battle of Chattanooga, and major-general for services in the field during the war. In November, 1865, he resigned his volunteer commission, and, in 1867, that in the U. S. army. In 1865 he became president of the International Telegraph Company; in 1875, police-commissioner of New York City, and soon thereafter was chosen president of the board. Since 1881 he has practised as a civil engineer.

SMITH, WILLIAM ROBERTSON, British theologian, was born at Keig, Scotland, Nov. 8, 1846. He graduated at Aberdeen University in 1865, and studied also at the Universities of Bonn and Göttingen. In 1868 he began to teach physics at Edinburgh, but he was already noted for his acquaintance with Oriental languages, and in 1870 was made professor of Hebrew in the Free Church College at Aberdeen. His course of instruction roused some opposition by its rationalistic tendency, and this was brought to a height on the publication of his article on the Bible in the *ENCYCLOPÆDIA BRITANNICA*. A series of trials in the Church courts for heresy ensued and, though he was not convicted, he was suspended from teaching, and finally removed from his professorship in 1881. The controversy had not prevented his contributing other articles of a similar kind, and he now became associate editor of the *BRITANNICA*. In 1883 he was made Lord Almoner's professor of Arabic in Cambridge University, and in 1886 librarian to that university. His separate publications are *The Old Testament in the Jewish Church* (1881); *The Prophets of Israel* (1882); and *Kinship and Marriage in Early Arabia* (1885).

SMITH COLLEGE, an institution for the higher education of women, was founded by Miss Sophia Smith, of Hatfield, Mass., who bequeathed the bulk of her property for that purpose; stated the char-

acter of the education which should be given; appointed the first trustees; and selected Northampton as its site. The market value of the funds which the college received from the estate of Miss Smith after her death, June 12, 1870, was estimated at \$387,468. To this sum the town of Northampton added \$25,000, to comply with a condition of her will concerning the site.

The college was incorporated by the Commonwealth of Massachusetts, March 3, 1871, and a charter was granted empowering it: "To grant such honorary testimonials, and confer such honors, degrees, and diplomas as are granted or conferred by any university in the United States. The trustees held their first meeting at Northampton, April 12, 1871, when the Board was organized. The same year 13 acres in the centre of the town were purchased as a site; but it was decided not to build until the funds could accumulate and a president be obtained. A circular issued by the trustees, Sept. 10, 1872, stated: "It is the design of the trustees, as it was evidently of the founder, not to add to the number of such schools, seminaries, or academies, as now exist for young ladies, but to realize completely and truly the idea of a *Woman's College*. They would secure to young women a culture fully equivalent to that afforded to young men by our best New England colleges, and yet differing from that as woman differs from man in her physical and mental constitution, and in the sphere of her active life. The requirements for admission will be substantially the same as at Harvard, Yale, Brown, Amherst, and other New England colleges."

Rev. L. Clark Seelye, D. D., was elected president of the college, June 17, 1873, while professor of rhetoric and English literature at Amherst College. He entered immediately upon the duties of his office, and under his direction the first academic building was erected, and formally dedicated, July 14, 1875. The college was opened for the reception of students the second Thursday in September, 1875. Those only were received who were able to meet the same requirements in Greek, Latin, Mathematics, and English, which were demanded in the New England colleges for young men. There was no preparatory department. A four years' course of study was adopted, corresponding in extent and thoroughness with the collegiate courses in the leading American colleges. The trustees decided to receive at the opening only those who were qualified to enter the First Class, and to add each year a new class and the requisite teachers, until the four classes and the Faculty were formed. Sixteen were admitted to the First Class and eleven teachers were provided for them. There were no commencement exercises until June 18, 1879, when eleven graduates received the degree of A. B.

A distinctive feature of the college was the adoption of the plan of comparatively small dwelling-houses, entirely distinct from the academic buildings, and arranged as far as possible like private houses. Each was to be presided over by a lady who should act as the "house mother," and whose special duty it should be to direct its social and domestic life. Students were permitted to choose between residence in these college homes or families in the town which were approved by the Faculty. One dwelling-house was provided at the opening of the college, and others were afterward erected to meet the wants of successive classes. These dwelling-houses are separate establishments; each has its own kitchen, dining-room, parlors, and bedrooms, and each is located apart so as to lessen the danger from fire, and to give free access of light and air to the other buildings. The largest will accommodate fifty students, and the smallest twenty-one; and the present policy is to provide accommodations for no

larger number in any single house. The plan of these dwelling-houses is the natural outgrowth of the design of the college, as expressed in its official circulars: "It is a Woman's College, aiming not only to give the broadest and highest intellectual culture, but also to preserve and perfect every characteristic of a complete womanhood."

The physical culture of the students is provided for by a gymnasium, and by a specialist in that department, who prescribes, after personal examination, exercises adapted to the individual need. In its religious character the college is Christian in its aims, but undenominational in management and instruction. There is no college church, and students are expected to attend churches in the city, according to individual preference.

For some years Smith College gave academic degrees only to those who completed the usual collegiate classical course, but in 1886 two additional courses of study were arranged, called the Literary and Scientific. These also extend through four years, and graduates from the Literary course receive the degree of Bachelor of Literature; from the Scientific course, the degree of Bachelor of Science; while graduates from the classical course continue to receive the degree of Bachelor of Arts. The distinctive peculiarity of these courses in Literature and Science is the requirement of a greater amount of modern languages or of the natural sciences, in place of the classics or mathematics. The design of all the various courses is thus stated: "The college is not intended to fit woman for a particular sphere or profession, but to perfect her intellect by the best methods which philosophy and experience suggest, so that she may be better qualified to enjoy and to do well her work in life, whatever that work may be."

In 1880 a school of music and a school of art were established in connection with the college, for the purpose of providing the best facilities for the study of Music, practical and theoretical, and of Drawing, Painting, and Sculpture; and the following year a Music Hall and Art Gallery were erected for their accommodation. These schools have separate corps of teachers, and regular courses of study extending through four years. Members of the academic department can take a part of any of these courses as electives, and students of approved age and attainments can pursue them exclusively as specialties. Post-graduate courses are provided for those who wish to pursue advanced studies in Music, Art, Philosophy, Language, Literature, and Science.

Additional gifts have been made to the college. The most important of these are: \$30,000 for an Art Gallery, and \$50,000 for an Art Fund, by Mr. Winthrop Hillyer; \$50,000 as a bequest from Mr. George W. Hubbard; \$32,500 for the Lilly Hall of Science, by Mr. A. T. Lilly; \$20,000 to purchase works of art; \$15,000 for an Observatory; 10,000 for additional studios to the Art Gallery; \$12,000 for scholarships; and \$5,000 as a bequest from Gov. W. B. Washburn. From its general fund the college gives annual scholarships of \$100 to all deserving students who are unable to complete a collegiate education without such aid. The present value of the college funds is \$469,283, and of its real estate, \$400,000.

Since the opening of the college the number of students has steadily increased, and in 1888 it was 435. The various classes number as follows: First Class, 155; Second Class, 98; Junior Class, 60; Senior Class, 48; Music School, 37; Art School, 31; Resident Graduates, 6. The Faculty, aside from lecturers and non-resident teachers, numbers 23, and includes both sexes in about equal proportions. Miss Smith in her will appointed only men as trustees, but in June, 1888, the trustees requested the associate alumni of the college to nominate three candidates

to fill existing vacancies in the Board, and that request will doubtless be complied with. (L. C. S.)

SMITHSONIAN INSTITUTION. This highly important American scientific institution has been already partly considered under **ACADEMIES OF SCIENCE** (q. v.). It was founded in accordance with the terms of a bequest made by James Smithson, of England, of whose life and services to science we may fitly here give a brief résumé. He was born about 1765, being a natural son of James Smithson, first duke of Northumberland, by Elizabeth Macie, and long bore the name of James Lewis Macie, adopting that of Smithson somewhere between 1791 and 1803. He studied at Oxford, and graduated from Pembroke College in 1786, becoming a Fellow of the Royal Society the next year. He devoted himself to the study of science, particularly of chemistry, and became an associate and friend of Sir Humphry Davy, Sir Joseph Banks, and Dr. Wollaston. The results of his scientific observations were published in *Philosophical Transactions*, *Annals of Philosophy*, and other scientific periodicals, and included treatises "On the Composition and Crystallization of certain Sulphurets from Huel Boys in Cornwall," "Facts Relating to the Coloring Matter of Vegetables," etc. He died at Genoa, Italy, on June 27, 1829, leaving by will the whole of his property to the United States, for the purpose of founding at Washington an institution, to be known under his name, "for the increase and diffusion of knowledge among men."

This bequest, amounting to more than \$500,000, was one of the first of those far-seeing gifts to mankind which have been of such great service to the progress of human knowledge, and the example of which is now being somewhat frequently followed. The bequest was accepted by Congress, June 1, 1836, and was placed under interest immediately on reaching the treasury, Sept. 1, 1838. It is now invested in the 6 per cent. gold interest bonds of the United States, and has been managed so skillfully and economically that the building has been erected solely from the interest, while the residue over that used for this and other purposes has been added to the principal until this has increased nearly \$200,000. The ultimate limit of the principal sum has been fixed by law at \$1,000,000.

The Smithsonian Institution was established by act of Congress, Aug. 10, 1846. It was to be administered by a Board of Regents, composed of the Chief Justice of the Supreme Court, three Senators appointed by the Vice-President, three Representatives chosen by the Speaker of the House, and six citizens chosen by Congress. The Representatives were to serve 2 years, the Senators for term of office, the citizens for 6 years, the services of all to be gratuitous. This Board meets annually in January, and receives and transmits to Congress the report of its Secretary, who is also Secretary of the Institution. In addition to the Board of Regents, the President, Vice-President, Cabinet Officers, and such honorary members as they may elect are by law constituted an "establishment," or board of visitors, which is entitled the Smithsonian Institution. The Regents and the honorary members of the "establishment" hitherto chosen have been men of eminence and uprightness as statesmen, the citizen members from the several states being selected for their high character and position, and literary or scientific reputation.

The building which has been erected for the purposes of the Smithsonian Institution is an imposing edifice, of the order of architecture known as Norman, or Romanesque. Its material is a red sandstone from the quarries of Seneca Creek, near Washington, the stone being rather soft when quarried, but hardening and developing great resisting qualities when

exposed to the atmosphere. The edifice consists of a main central building of two stories, with two wings connected by intermediate ranges. The dimensions of the main building are 205 by 57 feet and 58 feet high, with two towers in the centre of the principal front, the higher of which is 140 feet in elevation. On the south front is a massive tower 37 feet high, and the building in all possesses 9 towers. The entire length is 447 feet, and the greatest breadth 160. The first story of the main building is one large room, 200 by 50 feet in dimensions and 25 feet high, with a row of columns down the centre. The second story has a room of equal area without supporting columns.

The corner-stone of this edifice was laid, May 1, 1847, with Masonic ceremonies, in the presence of Pres. Polk and his cabinet, the oration being delivered by the Vice-President, George M. Dallas. On Jan. 4, 1865, it took fire from a defective flue and was partly destroyed, the west end and part of the centre being burned. Much valuable material was destroyed by this fire, among it the Stanley gallery of Indian paintings, an irreparable loss. Its only counterpart is the Catlin gallery, now in the care of the Institution. The building has been slowly restored from the income, without detriment to the scientific work of the Institution, and is now a fire-proof structure, situated in the park reservation and thus removed from all danger of conflagration.

By law the Smithsonian Institution is the depository of the United States National Museum, which was at first partly supported by its funds, but is now sustained at the sole expense of the government. This museum, beginning with the scientific material collected by the Wilkes exploring expedition, and designed to contain "all objects of art and of foreign and curious research, and all objects of natural history, plants, and geological and mineralogical species belonging or hereafter to belong to the United States," has greatly augmented, and become so rich in many departments that the building of the Institution is quite insufficient to contain it, and an adjoining edifice of very extensive floor-space has been erected for that purpose. The Smithsonian building now contains only natural history and other strictly scientific material, while much of this, together with a vast accumulation of objects of human art, has been removed to the new edifice. The art collections are now deposited in the Corcoran Gallery, while the library, of 75,000 volumes, has been added to the Library of Congress, and forms the Natural Science section of that library.

In this way the extraordinarily large collection of materials made within forty years has been disposed of, and the Institution left to its legitimate functions of "the increase and diffusion of knowledge among men." In the furtherance of this purpose, the Institution has from time to time taken upon itself functions from which it has been since relieved by act of Congress. Thus for a number of years it conducted a series of meteorological observations, and began that systematic study of the weather which is now performed by the Weather Bureau of the government. In like manner, its herbarium and entomological collection has been transferred to the Department of Agriculture, which now conducts the important study of insect-ravages upon agriculture. Thus one by one departments of study adopted by the Institution have been removed from it, and its income is now used for strictly scientific purposes, without special regard to economic considerations. It is, in fact, now restricted to its original purpose of "the increase and diffusion of knowledge," the first being achieved by scientific study of the material which is constantly flowing in from government and private exploring parties in all parts of the country; the second, by its useful work of receiving

and distributing to learned bodies and individuals at home the publications of similar bodies and individuals abroad, and by the highly valuable publications which it issues from time to time.

The publications of the Institution comprise three series, the first and most important being *Smithsonian Contributions to Knowledge*, embracing records of original investigation which have resulted in what appear to be new truths and constitute positive additions to the sum of human knowledge. Of this series 25 volumes have been issued. Second, *Smithsonian Miscellaneous Collections*, containing reports of the state of knowledge in particular branches of science, lists and synopses of species, reports of explorations, instructions for collecting, etc. This series now numbers 33 volumes. Third, *Annual Report of the Smithsonian Institution*, in which, in addition to the business report, interesting foreign and American scientific treatises have been published, and of late years an annual report of the general progress of science in all its branches. The publications of the National Museum, of the Bureau of Ethnology, and of the Philosophical Society of Washington are also published under the auspices of the Institution, while with its work has of late years been associated the scientific observations of the United States Fish Commission, which is now under the control of the Secretary of the Institution, and much of whose studies in development, artificial fertilization, etc., has been done within its walls. The vast mass of material, indeed, which has steadily poured in from every direction and many sources, has proved beyond the ability of the scientific corps of the Institution to handle, and much of it remains in an inchoate condition, the more perishable portion slowly becoming useless for want of prompt handling. This is a state of affairs for which the governing powers of the Institution are not responsible, but which sadly needs remedy, either by a decided increase of the scientific corps, or a check to the inflow of material until that now accumulated can be studied and disposed of. Scientific material which cannot be promptly handled would, as a rule, be far better left to its natural habitat and condition.

The Smithsonian Institution has, almost since its inception, been under the control of two of our prominent scientists, men remarkably well adapted to develop the important interests committed to their care. The first Secretary, elected at the foundation of the Institution in 1846, was Prof. Joseph Henry, the eminent electrician, than whom no man stands higher in the ranks of American scientists. Prof. Henry was strictly conservative in his direction of the important trust confided to him, and aimed rather to diffuse knowledge and stimulate research than to make large collections of material. In 1850 Spencer F. Baird was elected Assistant Secretary, and to him was committed the control of the National Museum, which Prof. Henry had regarded rather as a departure from the original design of the Institution. Prof. Baird took active measures to develop the museum by enlisting in the service the leaders of government explorations, providing them with materials and instructions, and organizing natural history parties in connection with all important expeditions. His annual report constitutes the only systematic record of the national explorations ever prepared. In 1871 Prof. Baird was appointed Commissioner of Fish and Fisheries, and in May, 1878, on the death of Prof. Henry, was made full Secretary of the Institution. He died, August 19, 1887, and has been succeeded in the Secretaryship by Prof. Samuel P. Langley, the eminent astronomer, recently director of the observatory at Allegheny City, Pa. George Brown Goode, who has for years been employed in the National Museum, has been appointed Assistant Secretary, the management of the

National Museum being placed in his hands. There is every reason to believe that the Smithsonian Institution, under this new management, with the experience and material gained during its former history, and its release from functions not directly in its designed line of work, will rapidly advance in usefulness and assume a position in the world of science on a level with that of the best equipped scientific institutions of foreign lands. (C. M.)

SMYTH, CHARLES PIAZZI, English astronomer, was born Jan. 3, 1819, being son of Admiral William Henry Smyth, and grandson of J. B. Palmer Smyth, of New Jersey, a loyalist in the American Revolution. W. H. Smyth (1788-1865) entered the British navy in 1805, and, after honorable service in the wars of Napoleon's time, was appointed to make a hydrographical survey of the coasts of Sicily, afterward of the Adriatic, and finally of the entire Mediterranean. He became rear-admiral in 1863, and devoted much time to astronomy. He erected private observatories at Bedford and Cardiff, and was president of the Royal Astronomical Society. He died at Aylesbury, Sept. 9, 1865. His son, Charles Piazza, had been trained in his father's observatory, and afterward was employed in the observatory at the Cape of Good Hope under T. Maclear. He made a valuable series of observations from the peak of Teneriffe in 1856, which were published in his book *Teneriffe, an Astronomer's Experiment* (1858). This was the first work illustrated by stereoscopic views. In 1843 Prof. Smyth was made astronomer royal of Scotland, and he has pursued scientific work in other countries. His most notable research was in regard to the Great Pyramid of Egypt, which he came to regard as built under Divine inspiration to fix a standard of weights and measures. This extravagant theory received some favor with a portion of the public, but not among the best scientists. The author defended it in three works: *Our Inheritance in the Great Pyramid* (1864), *Life and Work at the Great Pyramid* (3 vols., 1867), and *Antiquity of Intellectual Man* (1868). He published also *Three Cities of Russia* (1862), and some other works.

SMYTH, NEWMAN, Congregationalist pastor, was born at Brunswick, Maine, June 25, 1843. His full name was Samuel Phillips Newman Smyth, but in recent years he has discarded the two first. He graduated at Bowdoin College in 1863, and at Andover Seminary in 1867. He travelled in Europe in 1868, and in 1870 became pastor of the First Church at Bangor, Maine. In 1876 he accepted a call to the First Presbyterian Church, Quincy, Ill., whence in 1882 he was called to a professorship in Andover Seminary, but his views in regard to the future state having provoked a controversy, he was not installed. He then became pastor of the first Congregational Church, New Haven. His publications are *The Religious Feeling: a Study for Faith* (1877); *Old Faiths in New Light* (1879); *Orthodox Theology of To-day* (1881); *Reality of Faith* (1884).

SMYTH, THOMAS (1808-1873), Presbyterian minister, was born in Belfast, Ireland, June 14, 1808. He was educated at Belfast College, and studied theology at Highbury College, London, and afterward at Princeton. He was ordained pastor of the Second Presbyterian Church in Charleston, S. C., Dec. 29, 1834, and held this position until his death, Aug. 20, 1873. He was a firm upholder of the faith and practice of his church, and advocated its cause in several popular treatises.

SNAKE-BIRD. See ANHINGA.

SNAKES. This article has regard chiefly to the more noteworthy of the numerous species of snake found in America.

The Hopoterodont serpents, or "blind-worms," are worm-like creatures, generally very small, nearly all living underground, and with the eyes as a rule

scarcely discernible. India and Australia abound in species some of which (like the earth-worms they so much resemble) come p. 189 (p. 199 Am. Rep.) above ground at certain times, and are then surprisingly active. Tropical

America and Mexico have quite a number of species. *Stenostoma dulce* is a species found in Texas, having the eye tolerably conspicuous.

The Colubriiform snakes constitute a suborder embracing nearly all the harmless snakes (other than the blind-worms), as well as a certain number of venomous species. Many of our common non-venomous snakes are exceedingly useful as destroyers of noxious insects (such as ticks and beetles), as well as rats, mice, and gophers. The Uropeltidae, or shield-tails (all South Asiatic), are noteworthy as having the habit and appearance of "blind-worms." The small family Tortricidae are also burrowers; and they are remarkable for the rudimentary pelvis, with a pair of small claw-like hind limbs. *Tortrix scytale*, from the Amazon valley, is handsomely colored, and, even while alive, it is often used by the natives as a necklace.

To the family of Calamariidae, or "dwarf-snakes," are assigned a very large number of small, semi-subterranean larva-devouring species of many genera. They are generally to be found under loose stones and logs. Among our common American kinds is the timid and inoffensive *Virginia striolata*, with the back of a brownish tint, and the belly of a salmon-red; it is common southward. *Carphophis amœna* is the "ground-snake" or "thunder-snake," familiar to every ploughboy, a subterraneous snake, perfectly harmless, and very awkward and slow in its movements. It is also brown, with a salmon-colored belly. There are a good many other American forms, especially in the tropical regions.

To the great family of the Coronellidae belong several of the largest and best known serpents in the country, such as the *Ophibolus triangulatus*, known as the milk-snake, house-snake, or "checkered adder," and the chain-snake or king-snake of the South, the *O. getulus*, and the well-known ring-snake, *Diadophis punctatus*. Here also belongs the hog-nosed snake, or sand-viper, *Heterodon platyrhinus*, rather numerous in sandy regions. It is a slow creature, of repulsive appearance and fierce aspect, hissing loudly when disturbed; but it is perfectly harmless. There are several others of its genus in this country.
